

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

—ON—

# "Firestone"

## PNEUMATIC TIRES

by a 6-cylinder Ford car on a Detroit circular track, June 21st and 22nd

E. 15110  
TL  
1  
.A96  
V. 17  
July-Dec.  
1907

### The Test:

Twelve hours of the racing was done on tires made by three of the largest other makers. The other twelve hours were run on "Firestone" Tires.

### The Result:

"Firestone" Tires made the greater mileage with one-fourth the tire changes. Also, "Firestone" Tires made a perfect score on four lighter cars, averaging 30 miles per hour, and came through without a scar.

### The Reason:

UNVARYING HIGH QUALITY YIELDS UNVARYING GOOD SERVICE.

### Racytype

#### Specifications:

Rear Axle. Timken Roller bearing  
Front Axle. Tubular ball bearing  
Springs. Transverse semi-elliptic front spring, platform type rear spring  
Wheels. 32 inches, wood, artillery type  
Tires. 32 x 3 1/2 Regular Clincher, G. & J. raised tread  
Brakes. Two external, two internal, operating on drums attached to wheels  
Tank Capacity. 15 gallons of gasoline  
Tread. 56 inches  
Wheel Base. 98 inches  
Motor. Four cylinder 4 x 51-8, cast in pairs  
Water-cooler. Capacity, 5 gallons  
Lubrication. Splash system  
Carburetor. Mora  
Ignition. LaCosta Magneto, also coil, timer and storage battery  
Control. Throttle and spark  
Transmission. Sliding nickel steel gears  
Speeds. 3 forward and reverse  
Drive. Shaft  
Steering Gear. Irreversible wheel, screw and nut type  
Equipment. 2 oil side lamps, 1 tall lamp, horn and tools  
Horse Power. 24. Mechanically Right.  
Approximate Total Weight. 1750 lbs.  
Price. \$2300

Built to meet the demand for a light, high grade, well accommodating driver, guest, and mechanic. Supplied consisting of four unit LaCosta coil, timer, and storage wired to separate set of spark plugs and working insures a smooth running reliable motor and transmission. moderate wheel base and light weight make the Racytype

**Mora Roadster**  
MECHANICALLY RIGHT

designed and carefully constructed, speedy road car, with the highest possible grade electrical equipment, battery, and LaCosta high tension magneto, each system pendently. Mora Mechanically Right construction Large tires in proportion to weight of car insure freedom from tire trouble. Its moderate wheel base and light weight make the Racytype both a good cross country and around town car, because it is fast enough to go the pace that exhilarates cross country and easy to handle in traffic in town. The speediest light car at anywhere near the price.

# THE AUTOMOBILE

## THE GRAND PRIX

PRESS BUREAU, NEAR DIEPPE, July 2.—At an average speed of 70:61 miles an hour, Felice Nazzaro, on a Fiat machine, has won the 478.4 mile speed test of the Automobile Club of France against thirty-seven of the world's most formidable flyers. The pace broke all world's records. Last year, on practically the same machine, the dashing Italian was an indifferent second in the Grand Prix, being defeated by Szisz on a Renault. His record this year is particularly brilliant, he being the winner of the Targa Florio, the German Emperor's Cup and finally the French

Grand Prix, the *dernier mot* of the automobile world. His car was fitted with Michelin tires and rims and Simms-Bosch magneto.

Second place goes to François Szisz, last year's winner of the Grand Prix, who, again on a Renault, finished in 6:53:10. France secures all other positions, as follows: (3) Baras, Brasier, 7:05:05 3-5; (4) Rougier, Dietrich; (5) Caillois, Darracq; (6) Rigal, Darracq; (7) Barillier, Brasier; (8) Garcet, Bayard-Clement; (9) Fitz Shepherd, Bayard-Clement.

On the start being given promptly at six o'clock, Lancia, who had the good luck to draw first place, rushed away with his usual impetuosity, going round the 77-kilometer triangular course in 41:33, equal to an average of 68 miles an hour. Excepting that Heath had a little difficulty in starting his Panhard, and was left behind by Christie, timed out one minute later, all the starts were made successfully, the machines immediately setting a faster pace than has ever been known in any automobile race in Europe. Richat's Aquila-Italiana was the only non-starter.

Three minutes after the last competitor had gone away, Lancia finished his round amid the strains of a military band and hoarse cheers from thousands of throats. His time, though fast, was not to be the best of the day, for sturdy Duray soon rejoiced the hearts of French spectators and admirers by a forty-minute trip. When Wagner roared through on a Fiat and the figures on the huge score board indicated 39:53—which means that he had traveled at 74.5 miles an hour—a yell of triumph went up from Italian and French throats, the former for the machine, the latter for the man. Hanriot, on a Darracq, made a good showing

on the first round, as did Szisz (Renault), with 40:39.

After the first three rounds the race settled down to a desperate struggle between Nazzaro, Lancia, Duray, Szisz and Wagner. Szisz was running with remarkable regularity and seemed likely to repeat last year's performance. Duray made a brilliant spectacular display, driving his huge Dietrich in a superb manner. When he finished the fifth round, half the race, he made his first stop on the wood side track, where the gasoline stations were located. Jumping from the machine the instant it stopped, he hurled

the cans of gasoline and water like one endowed with demoniac strength, took on board his full allowance and was away again—to a glorious victory, as it appeared—before the crowd could sufficiently recover from its astonishment to send up a rousing cheer. Sixth, seventh and eighth rounds were covered without any flagging of the killing pace, when just as the rumor was going round the stands "Duray is the winner," an official note appeared on the blackboard that the French champion was down and out with a broken bearing.

### Christie's Ill-luck Followed Him to France.

Walter Christie, starting twelfth, had not been heard of when Lancia and Duray completed their second round. His first round was made in 1:20:13, in which time several had been round twice; his second round was completed in 2:9:2 elapsed time, and his fourth in 4:58. A broken valve caused serious delay, and a seized clutch finally eliminated the American candidate. Fitz Shepherd, driving the late Albert Clement's machine, did some fast running, but owing to minor troubles failed to get near the leaders. Heath's Panhard broke down without injuring the driver. At the right-angle turn at Londinières Richez, driving the third Renault, missed the turn and upset. Bablot, who was just behind him on a Brasier, swerved into the ditch to avoid an accident and damaged his machine. Richez was unable to continue, but Bablot after a little delay got under way again. Wagner's brilliant debut finally terminated in a ditched and abandoned machine. Mercedes again failed to make a showing, and English and

Belgian machines were no more successful than the American. On the last round, when almost certain of third position, Lancia's gasoline supply became exhausted and he was stranded by the roadside just as in the Gordon Bennett race of 1905. Strangely, it was again a Brasier, this time driven by Baras, which forged ahead and secured a victory at the expense of the Italian.

**Animated Scene at the Starting Line.**

PRESS BUREAU, NEAR DIEPPE, Tuesday, July 2.—Just as the town clocks in quaint Dieppe, three miles away on the coast line, were giving their six morning clangs, Lancia's huge Fiat was roaring with a harsh voice on the edge of the wooden loop track running into the upper leg of the 77-kilometer Dieppe circuit. The usual *êtes vous prêt—cinq, quatre, trois, deux—alles*, distinguishable above the roar of the exhaust only by those at the starter's elbow, and the intrepid Italian dashed off followed by a roar such as had never before been heard at a European auto race. With thirty-eight machines starting at intervals of one minute there is no lack of interest and no time to be lost on the part of the drivers and officials. In Indian file they stand on the wooden track, the first one with its wheels on the white line indicating the starting and finishing point, advancing with clock-like regularity at the call of the starter, cranking up as quickly as possible and darting away on the life and death struggle. There is less roar and smoke than on previous occasions, for not a drop more than 50.84 gallons of gasoline is available for the 478.4 miles to be covered at fantastic speed. Each man has drawn off a quart from his regulation allowance to prime his motor, but it is too precious to waste, and cranking at the latest possible moment is the rule.

the event is unique; the feverish anxiety of the start, a dash of speed in the distance, the enthusiasm of the enormous crowds securely walled behind stout barricades fringed by red trousered infantrymen accoutred for active service, and away in the rear—if one cared to look in that direction—the blue waters of the English Channel sparkling in the bright morning sun which has succeeded the rain and gray skies of yesterday. Fifty thousand persons are estimated to be massed in the grandstands, with an additional 150,000 scattered round the course. Americans are not very numerous, Jefferson DeMont Thompson, of the A. A. A. racing board, being the only prominent automobilist. Other Americans were visitors who happened to be touring France.

American interest is centered in Walter Christie at the wheel of the front drive machine which he built on the banks of the Hudson, starting twelfth, with sober Le Blon ahead of him on a Panhard, and Salzer, the acrobatic driver, behind him on a Mercedes. At the last moment Fitz Shepherd has entered on the scene and is piloting 32-BC—the Bayard-Clement, which Gaudermain would have driven had not one of the saddest of accidents removed Albert Clement from our midst. All three Bayard-Clement machines have been sold, Albert Clement's mount to M. de Bourbon, who put Pierre Garcet in charge of it; the second to Baron de Dorlodot, with Venus, young Clement's mechanic in many a race, now driving; and the third to Fitz Shepherd. No. 5 arouses Yankee interest, for although the Porthos is built almost at the doors of Paris, Striker, who is at the wheel, does not hide the fact that he is a naturalized American. Page, too, on one of the Motoblocs from Bordeaux, has a real interest in the land of the Stars and Stripes.

**THE GRAND PRIX CIRCUIT NEAR DIEPPE.**

Total length of the circuit is 76 kilometers 088 meters, which, allowing for the turns, is officially considered as 77 kilometers (47.84 miles). Ten rounds have to be covered by Grand Prix racers, giving 478.4 miles. Sporting Commission Cup machines cover only six rounds, or 287 miles.

Fuel allowance for Grand Prix machines is 50.82 gallons, equal to 9.59 miles to the gallon. Sporting Commission Cup machines are allowed 15.2 gallons, requiring 19 miles per gallon.

Away over to the right, across country, a flash can be seen at intervals of one minute as the machines speed along the second leg of the triangle toward Londinières. As a spectacular display

Rigal, on No. 30 Darracq, which Wagner deserted some time ago, receives a sympathetic send off, for everybody knows that half his fees and half his winning premium—if he wins—will be handed over to the widow and children of Marius Pin, who was killed on the same car down at Rambouillet but a few weeks ago. Nazarro, the hero of Sicily and the Taunus, is distinctly favorite; Lancia is in good favor; though Wagner receives a rousing cheer it is intended more for the driver than for the machine which he mounts. The feeling of certain individuals can be gauged by the fact that they would have shut out the Fiat team on the ground that the cars did not comply with Art. 3, declaring that "each constructor shall have the right to enter three cars." The application of such a rule would have had a boomerang effect, disqualifying three Darracqs and the three Bayard-Clements at the same blow, and was wisely dropped.

#### Order in Which the 38 Machines Got Away.

Full list of starters, together with their time, is as follows. It will be noted that numerous changes have been made since the first official list of drivers was produced:

Car	Country	Driver	Start
1. Fiat (Italy)	Italy	Lancia	6:00
2. Corre	France	D'Hespel	6:01
3. Darracq	France	Caillols	6:02
4. Lorraine-Dietrich	France	Duray	6:03
5. Porthos	France	Striker	6:04
6. Dufaux-Marchand	Switzerland	Dufaux	6:05
7. Bayard-Clement	France	Garcet	6:06
8. Motobloc	France	Page	6:07
9. Renault	France	Szisz	6:08
10. Germain	Belgium	Degrafs	6:09
11. Panhard-Levassor	France	Heath	6:10
12. Christie	America	Walter Christie	6:11
13. Mercedes	Germany	Salzer	6:12
14. Weigel	England	Harrison	6:13
15. Gobron-Brillie	France	Rigolly	6:14
16. Aquila-Italana	Italy	Richat	Retired
17. Brasler	France	Barillier	6:16
18. Fiat	Italy	Nazzaro	6:17
19. Darracq	France	Rigal	6:18
20. Lorraine-Dietrich	France	Rougier	6:19
21. Bayard-Clement	France	Venus	6:20
22. Motobloc	France	Pierron	6:21
23. Renault	France	Edmond	6:22
24. Germain	Belgium	Roch-Brault	6:23
25. Panhard-Levassor	France	Le Blon	6:24
26. Mercedes	Germany	Jenatzy	6:25
27. Weigel	England	Laxen	6:26
28. Brasler	France	Baras	6:27
29. Fiat	Italy	Wagner	6:28
30. Darracq	France	Hanriot	6:29
31. Lorraine-Dietrich	France	Gabriel	6:30
32. Bayard-Clement	France	Fitz Shepherd	6:31
33. Motobloc	France	Courtade	6:32
34. Renault	France	Riches	6:33
35. Germain	Belgium	Perpere	6:34
36. Panhard-Levassor	France	Dutemple	6:35
37. Mercedes	Germany	Hemery	6:36
38. Brasler	France	Bablot	6:37

A distinctive color for the cars of each nation was adopted, as follows: Germany, white; America, white and red; England, green; Belgium, yellow; France, blue; Italy, red; Switzerland, yellow and red. A letter or combination of letters identified each team, the combination being made as far as possible of the initials of the firm. Individual cars in each team were numbered 1, 2 and 3.

Distinct from the Grand Prix there are two other contests held at the same time, one the Sporting Commission Cup, for machines not consuming more than 7.26 gallons per 62.1 miles, and the other for tires. The smaller racers were sent away on the special loop track at intervals of five minutes, the first one leaving at nine o'clock. They were only required to cover six rounds, giving a total distance of 287.07 miles with a gasoline allowance of 15.2 gallons, which approximates 18 miles to the gallon. All Sporting Commission racers had to be painted iron gray with

their starting number in red. The nine machines with their drivers are:

1. Gillet-Forest (De la Touloubre).
2. Darracq (De Langhe).
3. Hermes H.I.S.A. (Depasse).
4. Porthos (Colin Defries).
5. La Bulre (P. Dumaine).
6. Darracq (Demogeot).
7. Hermes H.I.S.A. (Moulin).
8. La Bulre (Mottard).
9. La Bulre (Dessaigne).

With the exception of the Hermes H.I.S.A. all the machines are French. Public interest in the tire test died as soon as it was discovered that only three firms, Hutchinson, Falconnet-Perodeaud and Boland, had entered. Better known firms, such as Michelin, Continental and Dunlop, engaged tire stands on the course, but abstained from the competition.

#### Some Previous Speed Records:

Last year's Grand Prix, run on two days over a total distance of 745 miles, was won by Szisz (Renault) at an average speed of 62.7 miles an hour. The fastest rounds on each day were covered respectively at 73 and 72 miles an hour, the circuit being 62 miles compared with 47 miles this year. In the Gordon Bennett race in Auvergne Théry averaged 48.8 miles an hour; the fastest time for any Gordon Bennett race was also by Théry, in Germany, when he averaged 59.6 miles an hour. On the Ardennes circuit in Belgium, which allows of a very just comparison with the Grand Prix, Duray averaged 66.05 miles an hour on a total distance of 372 miles. One hundred kilometers, flying start, were reeled off by Wagner at a rate equaling 70.5 miles an hour, which, although the official record for that distance, is considerably below the speeds attained on the Sarthe course. In Vanderbilt contests Hémerly set the highest average in 1905, when he covered 283 miles at the rate of 61.49 miles an hour. Wagner had almost as good a record with 61.43 miles an hour. Heath, in 1904, only averaged 52.2 miles an hour.

#### NEW MASSACHUSETTS LAW IN EFFECT AUG. 1.

BOSTON, July 2.—Governor Guild has signed the new automobile registration bill. The bill does not mention the much-mooted sliding scale registration system, but provides for a flat annual registration fee of \$5 for automobiles and \$2 for motorcycles.

The fact that the new law becomes effective August 1 will mean that the 15,000 or more automobile owners in Massachusetts will be obliged to have their cars re-registered, and will have to pay \$5 for the process, no matter if they have just paid \$2 under the old law. Moreover, the first of next January they will have to pay another \$5, as the law provides for an annual registration on the first of January of each year.

#### HEAVY FINANCIAL LOSS ON GERMAN RACE.

BERLIN, June 25.—\$40,000 constitutes the total loss of the German Imperial Automobile Club on the Emperor's Cup race held on the Taunus circuit. The organization, the most elaborate of any contest, called for an expenditure of \$100,000, to meet which the organizers have only the engagement fees and the guarantee fund of \$20,000 raised by the national club. Largely owing to the bad weather, very little was obtained from the rent of grandstands.

#### NO BAGGAGE TRUCKS FOR A. A. A. TOURISTS.

At first it was thought that the custom of having a baggage truck accompany the A. A. A. tour would be followed again this year and the Reliance two-cycle truck was to have been given the honor for the 1907 event, but it was recently decided by the committee that they would not undertake to carry the baggage of the contestants in this year's tour, so there will be no official baggage trucks as hitherto.

CHICAGO, July 1.—Eighty-six starters, fifty-five machines with perfect scores, is the epitomized result of the reliability test planned by the Chicago Motor Club and the Chicago Automobile Trade Association and consummated June 28.

When last year's event was brought forth 88 machines responded; this year 95 entered their names on the list, and of this number 86 came to the starting line for the 148-mile run through Waukegan, Half Day, McHenry, Elgin and Aurora. The small ones only tackled the 143 miles trip, the big fellows running on and adding an additional 26 miles to their task. All, however, finished at Grant's Monument in Lincoln Park.

Bonnets were sealed down, the engine must never cease to turn over, and no water must be added to the quantity on board at the start. Gasoline and oil could be shipped aboard in any desired quantities, and no limit was placed on number of tires to be used or any penalty for attentions to them en route.

Under such rigorous conditions the percentage of perfect scores is surprising. It is equally satisfactory to note that they are well proportioned through all classes. In class I, machines listed under \$1,500, 12 out of 18 finished without a spot against them; class II, cars listing \$1,500-\$2,300, produced 7 clean scores out of 10 starters; class III, machines over \$2,300, 26 out of 39; in class IV, roadsters listing over \$1,500, 10 out of 12 starters finished with perfect scores. Of the 29 which incurred penalty points for various reasons, 7 only failed to finish the distance, showing that mechanical troubles of a serious nature were rare.

A side issue of the tour was a team contest in each class, prizes being offered for the team of three cars of the same make which did the best work. Twelve teams entered, of which Pierce Arrow and Haynes tied with perfect scores. National's chance was spoiled by Temple stalling his engine, while the Locomobile team lost through Leiser incurring 25 penalty points.

**Standing of the Teams in the Different Classes.**

**CLASS I**

Jackson, 70, 80 and 90—perfect scores.  
 Ford, 76, perfect; 87, penalized 5; 88, perfect.  
 Holsman, 84, perfect; 85, 15 points; 86, 25 points—total, 40.  
 Maxwell, 77, 65 points; 78, perfect; 89, perfect—total, 65.

**CLASS II**

Maxwell, 13, 22 and 23, perfect.  
 Premier, 48, 250 points; 49, perfect; 50, perfect.  
 Dragons, did not finish; 10, perfect; 28, did not start.  
 Jackson, 32, perfect; 62, did not finish; 73, perfect.

**CLASSES III AND IV**

Pierce, 1, 2 and 29, perfect.  
 Haynes, 37, 52 and 56, all perfect.  
 National, 53 and 60, perfect; 54, 25 points—total, 25 points.  
 Locomobile, 26 and 30, perfect; 17, 75 points—total, 75 points.

lunching place for the tourists Friday, July 19. A. B. Tucker tells of the trip in this most interesting manner:

"We departed from Canton by East Tuscaroras street at 2:49 in the afternoon, which is somewhat later than the hour at which the big tour will start. The city streets and the road into which they lead are not good for more than a mile. Then the tourists will plunge into a fair dirt road for about four miles, and following that a stretch of some ten miles, a very bad, hard clay highway with many turns on hills. But these troubles will be offset by delightful scenery which begins to flash upon the eye of

FROM Cleveland, in the early morn of Wednesday, July 10, there will start the fourth annual touring cavalcade of the American Automobile Association, present indications being that a hundred and more cars will participate in what will be the greatest affair of the kind in the history of automobiling. The touring car entrants will strive for perfect scores and the possession of the Charles J. Glidden trophy, while the runabout division will contend for the ownership of the Frank B. Hower trophy, offered by the chairman of the Touring Board, who has worked conscientiously and successfully in planning the details of the 1,500-mile journey which will have its ending in New York City on Wednesday, July 23.

The original plan of scoring club teams competing for the Glidden trophy having been found, upon careful reconsideration, to be disadvantageous to the smaller teams, the Touring Board's executive committee, which had accepted the finding of the manufacturers in the first place, listened to the protests of entrants and last week modified the rules in such a manner as to give the minor teams the same chance as the larger ones.

Preceding the start at Cleveland the Cleveland Automobile Club will entertain the entrants on the previous night. Chicago will extend the glad hand through its two clubs, and there will be more or less hospitality all along the line. It might be remarked, however, that as the tour progresses its participants will gradually adopt the early-to-bed habit with increasing unanimity.

#### A Preliminary Scurry Over Part of the Route.

A four and a half day trip of interest to those who are girding up their loins for the tour was made recently by the first of the 1908 Peerless cars under the guidance of Designer Charles Schmidt, with Vice-President E. H. Parkhurst as one of his companions. The run was primarily to test out the Cleveland factory's product and was consequently undertaken under touring conditions, with a full load of passengers and no elimination of baggage or fittings. At the same time it gave an excellent opportunity to study road conditions over the severest part of the Glidden Tour route—the Allegheny Mountains and the sections where road building is not.

The run was begun on Sunday morning, June 16, when the car left Cleveland running to Canton, O., for luncheon. During the same afternoon the trip was continued to Beaver, Pa., where the party stopped for the night. On Monday the road lay through Pittsburg as far as Bedford Springs. On Tuesday, over the mountains the road led to Baltimore. On Wednesday the run was from Baltimore to Philadelphia, on Thursday from Philadelphia to New York, a half day only being consumed in the latter trip.

Canton was the first stop, and to reach it the road led through Bedford, Twinsburg, Hudson, Tallmadge, Monroe Falls, Springfield, Uniontown, New Berlin. At Canton there was luncheon at the Courtland House, a modern fireproof hotel which will be the

the passenger soon after leaving Osnaburg.

"Lisbon is reached through a road cut into the mountain side and a high iron bridge 125 feet below, which is Beaver Creek, one of the prettiest of streams. From this point on there was no further trouble with road directions, for it is a straight highway through to Beaver, by way of Clarkson and Frederickstown. Beyond Frederickstown the water-breaks become more frequent. These devices, contrived by some degenerate of revolutionary days and maintained in all their crude simplicity by the patient custom-followers of this district, are from 12 to 16 inches in height and are made by digging a ditch across the road and at a slight angle—so slight that the ditch almost seems to run straight across the highway. They must be approached cautiously, crossed as much on the bias as possible, and the engine throttled down until there is barely enough power left to lift the rear wheel over the obstruction.

"Beaver was reached at 7:55 in the evening, the odometer registering 426 miles. During the day 117 miles had been covered in about eight hours. This made a running schedule of about fourteen miles an hour. Our experience proved to us that if a

PEERLESS REACHES TOLLGATE AT BELLAIR IN MARYLAND

LOG-KEEPER E. H. PARKHURST AND PILOT CHAS. SCHMIDT.

schedule for the afternoon of July 19 should be made at a greater rate than ten miles an hour many of the cars in the tour will not be able to make the controls. Ten miles an hour will be the utmost which most cars can be expected to make, with comfort to the passengers and safety to the vehicle. It has been intended to run to Pittsburg before nightfall, but the hard road encountered and the hardest road known to be waiting us, made the stop at Beaver an act of discretion.

"The party was up and out of the little Pennsylvania bamlet at 7:25 the next morning. The main road which we traversed was in the throes of the construction of a new trolley road. The road from Beaver is across a bridge into Rochester, a railroad center and a mass of factories and car shops. From there the route follows the Ohio River into Pittsburg. The road out of Pittsburg is an involved one by way of Wilkinsburg, Swissvale and up a very long hill perfectly paved with vitrified brick, following a trolley line as it climbs a mountain, to Braddock. From the top it is a short run to East McKeesport, where begins the old Greensburg pike, which is no race track. It is carved out of the rock and on it are several thousand water-breaks. But it is through the foothills of the Laurel Mountains, and the country through which it passes is as beautiful as any the sun shines on.

"After passing Greensburg the road became even worse than before. It was only a worn way through the sand and boulders, and there had been frequent washouts on the hilltops. But for the greater part of the distance there were few curves. At one point, from the top of a hill, the road can be seen for six miles as it runs straight as an arrow through a valley and up a mountain side. The pike makes its way straight through Youngstown, Ligonier, Jennerstown, Stoystown, Kantner, Wolfsburg, to Bedford. We were tired from the bumps as we drew into Bedford Springs at 6:50 o'clock. This is the night stop for the A. A. A. tourists on July 20, Saturday night.

"Our odometer registered 550 miles at Bedford Springs. This means that we had covered 124 miles since 7:25 in the morning. Allowing for our stop in Pittsburg and at Greensburg for luncheon, and the stops for pictures and bothered horses, we had run about eight and a half hours. The hourly average was not flattering—about fourteen and a half miles. But it will be too fast for the tour schedule.

"The run of the next day was from Bedford to Baltimore. Practically it consists of two distinct portions—first the crossing of four mountains with a better road than had been encountered previously, but with more frequent bumps—and second, the level Hagerstown pike and the good toll roads which follow it. The bad road is followed as far as McConnellsburg, and just beyond that town, by bearing right at the forks, the Hagerstown pike is taken. From Bedford the tourists will pass through Everett, Ray's Hill, Breezewood and McConnellsburg.

"At McConnellsburg the toll gates first begin to be an institution. There are still three mountains to be crossed. One of

the grades is about a four-mile climb. But these would not be difficult if it were not for the water-breaks which are here found most frequently. It is on these descents that the car seems to yearn to float down into the valleys.

"It is a most restful feeling which comes over the tourist as he passes through Mercersburg and realizes that the mountains are sinking into the distance behind him, while ahead is a level, white, clean, smooth, macadam pike, capable of being covered at any reasonable speed with small danger except from teams upon the road. We stopped for luncheon at Green Castle, the last town before crossing the Maryland line.

"The going is good all the way to Baltimore. It is all historic ground and it is a pity that the schedule conditions will preclude stops at Bolivar and Frederick.

"The roads from Baltimore to Havre-de-Grace were the best encountered on the trip. Designer Schmidt opened the throttle and we ran for miles and miles at sixty miles an hour, with the speedometer once hitting 62.

"Of the last half-day of running across New Jersey little need be said here. The route by way of Bristol, Pa., Morrisville, N. J., Trenton, New Brunswick, Metuchen, Rahway, Elizabeth, Newark, is too well known to need comment."

#### What Two Bisons Deducted from a Run.

Having covered the entire route of the Glidden Tour in nine days from the time they started from Cleveland, George M. Davis and E. C. Richard returned to their homes in Buffalo with the Thomas Speedway Flyer in which they made the trip. Among the many things which the two in the Thomas say they learned regarding this year's tour are:

That very little level country will be seen after the tour leaves Columbus, O.

That it would be well for the tourists to brush up a bit on their Civil War history in order that they may understand the battlefields over which they pass.

That tolls will amount to much more than they did in Canada last year.

That the people of Maryland, particularly those living on farms, are most cordial to automobilists.

That the tour will not be any easier than it was last year, despite some opinion that it will be.

A BALTIMOREAN GLIMPSE: WASHINGTON MONUMENT.

MICHENER, CHIEF PILOT OF THE WINNING CAR, IN FRONT OF HIS HEADQUARTERS INSIDE THE TRACK.

PHILADELPHIA, July 1.—Marred from the spectators' viewpoint by a pitiless storm, the 24-hour Endurance Derby of the Quaker City Motor Club at Point Breeze track came to a finish at 5:18 last Saturday afternoon, after a most sensational battle. H. A. Lozier's 40-horsepower Lozier captured the honors with a score of 717 miles; the Philadelphia Motor Car Company's 50-horsepower Frayer-Miller finishing second with 711 miles; C. A. Schroeder's 40-60 Darracq, third, 683 miles; Girard Motor Car Company, 30-35 Cleveland, fourth, 564 miles; Philadelphia Motor Car Company's 24 Frayer-Miller, fifth, 507 miles, and Penn Auto Company's 12-horsepower Flying Dutchman, sixth, 379 miles. Four other starters were withdrawn, three of them after being ditched and wrecked.

Up to 3 o'clock Saturday morning everything augured deep cuts into the Soules brothers' figures established at Columbus, O., on July 4, 1905—the only accepted record that could be used for a comparison. The Mercedes "60" had ground out 44 miles in the first hour and the Frayer-Miller began at the second to cut under not only the Soules figures, but its own, made on the same track four weeks ago. At the end of the fifth hour the big air-cooled car had covered 211 miles, as against the Soules' 198 and its own 199.

At the end of the tenth hour—just as the first sprinkle of what later developed into the heaviest rainfall of the season became evident—"Dan" Webster had driven the big Frayer-Miller 412 miles, which was an even 50 miles better than the Soules record and 34 more than his own best. Even at the end of the fifteenth hour, after five hours' driving rain had transformed the entire track into an oily mush, the Frayer's 559 miles was 36 miles ahead of the Soules figures and 30 better than its own.

Indeed, it was not until nearly the end of the eighteenth hour, at 11:18 A.M., that the execrable going put the Frayer one mile behind the record of 616 miles. At this point Webster and Knepper had a lead of 31 miles over Michener and Mulford in the "40" Lozier. The "F.-M." crew now seemed to be weakening and changed often, both men driving on their nerve.

The completion of the nineteenth hour saw the gap separating the contenders reduced to 23 miles. The next two hours saw this lead still further cut to 10 miles, and now ensued a fierce battle between pluck and tired nature. Knepper, as a result of inflammation of the eyes due to the oily slime which trickled into them behind his goggles, could not see at all, and Webster, who had done the bulk of the driving, was in a state of collapse. He insisted, however, on going ahead. The 24 Frayer-Miller, which was in fifth place, was temporarily withdrawn and Lawwell, one of its drivers, was put up in Webster's place. Before this

was done, however, at 3:05 P.M., the Lozier had gained the lead. The completion of the twenty-third hour showed the Lozier eight miles to the good, and as the rules required all cars to be on the track and running, to be considered as finishers, the Frayer "24" crew had to go back to their car, and Ernest Kelly, who gained fame last winter by piloting the Thomas to its record-breaking non-stop record, volunteered to relieve Webster. The latter, having been struck in the eye by a piece of flying mud, had temporarily lost control of his car, which had skidded into the fence. "Dan," to shield himself, put out his hand to ease the force of the impact, and received a frightful cut on the wrist. That finished him. The ambulance was called.

Kelly tried in vain to reduce the Lozier's lead, but Michener and Mulford would not be denied, and when Wayne Davis' gun cracked at 5:18 their lead had not been materially decreased.

The result of the race was a practical triumph for every one of the six cars which finished. Never in the history of track racing had such conditions been encountered. Indeed, shortly after daybreak some of the contestants appealed to Referee Johnson and the other officials to call the race off and finish it some other day, meanwhile impounding the cars under guard. But after a hurried council of war the Quakers decided that a 24-hour race could not be run in two sections and the harried and exhausted crews were hurried on.

With each succeeding minute the conditions grew worse. Despite chain grips, all the cars skidded badly on the turns, even at the twenty-mile gait, which most of them found all too speedy. Each attempt to "hit it up" caused the cars to skid like a boy's

KNEPPER AND FRAYER-MILLER THAT FINISHED SECOND.

WHERE THE CAMPS OF THE VARIOUS COMPETITORS WERE LOCATED IN THE INTERIOR OF THE FIELD AT POINT BREEZE TRACK.

sled rounding a right-angled corner on an icy pavement, and a shower of oily liquid mud oftentimes hid the car and its occupants from sight when the twenty-mile limit was exceeded. The few hundreds of spectators who huddled in the grand stand and on the clubhouse porches were frequently impelled to shout unheeded warnings to the drivers during the Lozier-Frayer duel in the last two hours of the race.

On the very last lap of the contest the Lozier's left chain broke on the far turn after a wrenching skid, but Michener brought the car round to the tape with only the right sprocket pulling. No better idea of the hardships encountered can be had than from the statement that the drivers during the last half of the race were seldom able to retain their places more than half an hour without being relieved. The relieved crews were immediately rushed into the sodden tents and after having eyes, ears and nose relieved of the omnipresent mud, were plied with warm drinks and tended as carefully as infants until the men they were to relieve staggered into the tent for a short respite from the relentless pelting of rain and oily mud.

There were two Loziers in the race. "No. 5," however, was transformed into a condition closely resembling scrap iron, when, about 11 o'clock Friday night, it skidded into the rail on the tricky first turn and turned turtle, without, however, injuring either of its occupants. This accident, it turned out, was a god-send, inasmuch as it enabled the entire team to center their attention on the remaining car, and gave Michener and Mulford much-needed relief when the crucial hours arrived later.

About an hour after the Lozier smash-up, the Mitchell, in attempting to pass the plodding 12-horsepower Flying Dutchman at the half-mile post, came into collision with it when the latter skidded into Driver Harkins' path. The latter tried to avoid the crash by making a quick turn to the left, but lost control of his car and crashed into the rail, the Mitchell toppling over on him. The "first aid" bunch in President Swain's Jack Rabbit quickly

rushed to the spot and, gathering up Harkins' inanimate body, ran it around the track, into the ambulance and thence to the Methodist Hospital, where the unfortunate driver later regained consciousness. The car was put completely out of commission.

The "60" Mercedes driven by Schill and Stillman had extremely bad luck, going through the rail in broad daylight, when the race was but two hours old, owing to a skid at a spot where the oil man had been a trifle too liberal. Straight into the rail the big car plunged, Schill and Stillman taking the air route ahead of it, and emerging from a soft spot in the ditch looking like trench diggers after a long day's job. They considered themselves lucky at that, although the Mercedes' left front wheel was broken off short and the car otherwise so badly injured that its withdrawal was imperative.

The Flying Dutchman "12," despite the shaking up it received from the Mitchell collision and an earlier dip into the ditch, was patched up sufficiently to allow of its proceeding at about a twenty-mile gait. It was one of the six survivors, despite its mishaps, which its drivers, George Stranahan and Frederick Lindner, look upon as a virtual triumph for their low-powered car.

Notes of Interest Gathered at the Track.

The "curtain raisers" on Friday afternoon were marked by fast time and fairly big fields. A peculiar feature of these preliminaries was that the Motor Shop, the local agency for the Stearns and the Oldsmobile, and which had entries in four of the five events, captured the honors every time—four firsts, three seconds and a third—thanks to the skillful work of Guy Vaughn and T. W. Berger. The Stearns was first three times.

If the Autocar managers carry out their announced intention the coming week will witness the hurling of a defi at the Lozier agents to meet their car, which won the May 24-25 race, in a 24-hour race on Point Breeze track on a date mutually agreeable. The Lozierites, it is understood, will accept the challenge.

# BALL BEARINGS FOR AUTOMOBILE CONSTRUCTION\*

By HENRY HESS.

In the automobile, as in all other mechanisms, the journals deal with loads having various directions. In the order of their occurrence and importance they are:

Radial loads—acting at right angles to the shaft axis;

Thrust loads—acting parallel to the shaft axis;

Angular loads—these may always be resolved into, or considered as made up of radial and thrust components.

FIG. 1.

FIG. 2.

Other things being equal, it is always best to arrange sustaining surfaces at right angles to the load direction. That gives the design of Fig. 1. Better carrying capacity is had from the modification in Fig. 2, in which races of curved cross-section are substituted for the straight line ones of Fig. 1. These grooved races have the advantage of greater sustaining capacity, as referred to more in detail elsewhere; as the tangent to the curve is normal to the direction of the radial load, the bearing is of the radial type. As is shown elsewhere, the sustaining capacity of the bearing is dependent on the degree of curvature of the race cross-section, being greater as the latter more nearly approaches equality with the ball curvature.

Cutting a local groove from the side into a race for the purpose of assembling the balls between the two races is general (see Fig. 3), but is not good practice. If such cut is confined to one race

FIG. 3.

which is then so held in the mountings as always to keep the opening at the unloaded side of the journal, this is at least defensible practice. The carrying capacity is then not decreased, as the load is carried by cross-sections of maximum sustaining ability. Unfortunately, this demands the use of two differing designs; the one with the cut in the outer race, the other with that placed in the inner race, according as the shaft or the housing rotates; the first case is the usual one of an ordinary journal; the second is found in wheel-hubs, etc. That occasional arrangement in which both hub and shaft rotate cannot be taken care of by this design.

It may be said here that high loads are dealt with. So long as the loads are low enough to be within the sustaining capacity of the straight line cross-section, such local straight section at the filling opening is of no moment. At high speeds this does not hold true, since then the catching of the balls at the junction of the filling, opening with the race, results in damage to the balls and, through these, to the race surfaces. With the cut in both races the carrying capacity is reduced to that of the straight line section at the side of the cut, since one or the other must come under the load in each revolution.

The requirement that the sustaining surfaces should be at right angles to the direction of the load is responded to by the collar type of Fig. 4. What has just been said of the cross-sectional

shape of the race surfaces in their relation to carrying capacity in radial bearings applies here also to the thrusts. Since the two races and the ball series do not form a unit handling as one piece, the need of a filling opening for the balls from the side does not arise. These bearings are frequently made with the surfaces *A* and *B* parallel. Provided such parallelism is secured, the design is good. Practically it is not realizable, since also similar parallelism between the collar of the shaft and the seat of the housing, though possible of initial attainment, cannot be maintained under the slight deflections due to the load. It must be borne in mind that initial errors in workmanship or deflections of a thousandth of an inch will cause the balls at one side to carry the entire load. For a given case this demands a bearing of needless size. By seating the one plate on a spherical surface, as *B*, this plate adjusts itself in such wise as to distribute the load over the entire number of balls. Speed very decidedly enters into the carrying capacity of this type of bearings as a factor; so much so, in fact, as to greatly reduce its utility for speeds above 1,500 revolutions per minute.

FIG. 4.

## Angular Load Bearings.

Of these there are shapes and modifications innumerable. Figs. 5, 6, 7 and 8 may be taken as typical and representing two, three and four-point contacts. In order to secure rolling, the contact points of balls and races should form points of a cone of rotation, whose apex lies in the center line of the shaft, or they may form points on the surface of an imaginary cylindrical roller that is parallel to the shaft. The defect in all of these forms is their adjustable feature. This places them absolutely at the mercy of every one capable of wielding a wrench; a bearing that has been properly proportioned with reference to a certain load, will be enormously overloaded by a little extra effort applied to the wrench. Or the bearing may be adjusted with too much slack with consequent rattle and early demise. The prevalent idea that these bearings may be adjusted to compensate for wear is erroneous. Wear will form a groove on the loaded side of the race deepest at the point of maximum load, about as in Fig. 9.

It is obvious that adjusting the cone endwise will only cause the balls to be more tightly pinched between the sound portions of the races, probably with sufficient pressure to overload; that will then cause an early flaking out, as shown at *A* in Fig. 10. These rough surfaces will quickly attack the balls and, progressively, the entire race.

The annular non-adjustable type of bearing will always, other things being equal, perforce have the important advantage of immunity from overload by maladjustment, no means for adjustment

FIG. 5.

FIG. 6.

being provided. Theoretically it would seem that the radial bearing would be incapable of carrying thrust load, owing to the wedging of the balls between the races. Fig. 11 shows the condition with the balls absolutely filling the space between the races. Fig. 12 shows the ball not quite filling this space. Fig. 13 shows the

\* Extract from paper read at the Indianapolis, Ind., meeting of the American Society of Mechanical Engineers. Continued from page 1029, issue of June 27.

condition of Fig. 12 under the influence of a thrust load. The ball does not come in contact with the race grooves where these are deepest, but on one side, so that the tangent to the race curvature at the contact point forms an angle with the line of thrust. For

FIG. 7.

FIG. 8.

Fig. 11 this angle would be infinitely small and the wedging action considerable. A calculation of the amount of the wedging action for Figs. 12 and 13 with the radial freedom permissible in the bearings still indicates an inadvisably large amount of wedging. But actual running tests as well as a large fund of accumulated

FIG. 9.

FIG. 10.

experience have absolutely proven that these bearings will carry much more thrust load than the calculation of the theoretical wedge angle indicates as possible. It is probable that the deformation which we know occurs at the point of ball contact and that results in small actual surface areas of contact instead of mere

FIG. 11.

FIG. 12.

points, has a mean tangent to such compression surface of greater inclination and that the wedge is therefore more blunt.

It has been experimentally determined that the thrust carrying capacity of the uninterrupted type of an annular bearing is to the radial capacity as 1-10 to 1-4 to 1, depending upon the relation of

FIG. 13.

FIG. 14.

ball diameter, race curvature, and number of balls. It has also been experimentally found and confirmed by experience that speed has very slight influence on this thrust carrying capacity; for speeds above 1,500 revolutions per minute these radial bearings of the uninterrupted race type are more efficient thrust carriers than the collar type.

This is characteristic, however, only of the uninterrupted radial type. Those forms in which the balls are filled in through an opening in the side, Fig. 14, may manifestly not be subject to end thrust, as that would cause the forcing of the balls into the interruption and their destructive pinching.

It is held by many designers of ball and roller bearings and others as well—that in such bearings adjacent balls or rollers are pressed against one another with considerable force. With the inner race of Fig. 15 rotating as indicated, the balls or rollers will also roll as indicated. The surfaces of the balls or rollers roll in

FIG. 15.

FIG. 16.

opposite directions, and therefore with sliding friction. This is assumed to be a serious defect by those who reason that these surfaces contact under pressure. The same general cure in forms innumerable has served to glut the records of our and various other patent offices. This cure, see Fig. 16, consists in the provision of smaller balls or rollers interposed between the larger ones, so that all contacting surfaces roll relatively to one another. This remedy is, however, fallacious in that it brings about the very condition it seeks to avoid. If two large balls, Fig. 17, compress a smaller one between them, and the three have their centers connected by a straight line, they will retain their relative positions.

FIG. 17.

FIG. 18.

If, however, the interposed roller or ball, Fig. 18, has its center to one side, then this roller or ball will be forced outward. The resort to a cage for retaining the interposed roller or ball, results in the latter being pressed against the sides of the cage and in the forcible sliding contact that it was intended to avoid.

In another design, Fig. 19, the interposed member is brought into contact with the race. Following out the directions of rotation shows that the various rollers or balls are in rolling contact, but that the interposed member has the wrong direction with reference to the race against which it is forced. These designs are all based on a failure to recognize an axiom in mechanics, according to which a force whose direction is normal to the supporting surface has no component in any other direction.

If a loaded plank, Fig. 20, is carried on two rollers, and plank and ground are parallel, the rollers will neither approach nor recede from one another. If the plank is not parallel to the ground, but bent down between the rollers, Fig. 21, the rollers will be forced apart. If the plank were oppositely curved upward, the rollers would be forced toward one another.

FIG. 19.

As parallelism is concentricity with an infinite radius of curvature, the parallel plank and ground may be regarded as elements of a roller bearing of infinite diameter. A mere change in diameter, while retaining the concentricity of the two races, does not alter the conditions, from which it follows that the load carried by a ball or roller does not press the balls or rollers against one another.

This may be considered in another way. With the shaft of Fig. 22 loading the inner race the latter is (fallaciously) assumed to act as a wedge, forcing the balls at the bottom apart and consequently producing pressure between the balls at the top. In that case the space  $d$  must be rather smaller than a ball diameter  $d$ . The rotation of the inner race carries the balls around the bearing; the diameter  $d$  is therefore forced through the smaller space  $b$ . To do this the ball must lift the inner race. The force to do this is imparted by the load, and is equal to the rolling friction and

FIG. 20.

FIG. 21.

can therefore amount to but a fraction of that load. We would then have the absurd condition of this smaller force overcoming the larger original force. Were we to assume that the inner race is not raised by the ball in passing, but that the ball compresses sufficiently to get through, it would mean that the absurdity of the small force represented by the rolling friction was sufficient so to deform the ball or roller.

If a vertically loaded bearing which is not quite filled, as Fig. 23, be rotated slowly enough for observation it will be found that the balls are separated near the top and slightly forward of the vertical in the direction of rotation, and that the balls, under the influence of their weight, drop through this gap with a slight click; this click is familiar enough to those who have not yet entirely forgotten the days when their noses cultivated the intimate acquaintance of their bicycle handlebars. It is this click which is

FIG. 22.

FIG. 23.

responsible for the high note of the high speed ball bearing of that type in which the races are filled with balls. I may seem to have dwelt unnecessarily long on this fallacy of ball and roller bearing design; its surprising prevalence must be my excuse.

**NOVEL ELECTROMOBILE BAGGAGE TRUCK.**

To facilitate the work of removing heavy loads of baggage and mail sacks from through trains at stations where short stops are made, as well as to lighten the labor of the baggage handlers, one of the railroads has adopted a number of electrically-driven baggage trucks. The outward appearance of the latter is the same as that of the standard truck and it is somewhat startling to see one man apparently hauling a ten-foot stack of trunks as if it were a child's wagon he were dragging. Closer inspection reveals the secret, as what appears to be a drag rod is used only for steering and turning the current on and off, for which purpose it carries a ring on the end. These trucks have been in operation for several months.

**FOR DETERMINING TIRE TEMPERATURES.**

It is a matter of common knowledge that as the result of friction both with the road surface and that produced by the relative movement of the inner tube and shoe of the tire, the latter reaches a high temperature when the car is run at great speeds, but up to the present little or no attention appears to have been paid to the matter of investigating this phenomenon. Observation has shown that the tires of a racing car reach a temperature that cannot be borne by the hand placed on the outside of the shoe, which would appear to indicate that the temperature of the interior of the tire might at times approach perilously near to the melting point of the rubber itself. In fact, some autoists have accepted this theory as being responsible for the partial dissolution of the inner tube generally termed "blowouts," but experience proves this to be erroneous, many of such injuries being nothing more or less than the result of carelessness in replacing the tube in the shoe, as a consequence of which a portion of it becomes pinched between the beads.

It is, in consequence, of interest to learn that a French autoist—Lucien Périssé, secretary to the Technical Commission of the Automobile Club of France—has devised a means of investigating tire temperatures somewhat more closely than the present method of feeling the exterior with the hand. Writing of his experiments in the *Bulletin Officiel de la Commission Technique*, he says:

"I have combined this device by means of utilizing a Scavland pressure indicator and a thermometer, with the aid of M. Morin, the maker of the former useful instrument. The pressure gage consists of a needle operated by an exterior button passing through an air-tight joint and so placed as to operate the stem of the valve, while the instrument itself is designed to be screwed on the shell of the latter in place of the cap.

"But in order to avoid the necessity of removing the instrument when it is found that the pressure of the tire is insufficient, a side outlet has been provided on the stem of the pressure indicator. Ordinarily this is closed by a regulation style cap, which may be removed whenever further inflation is necessary. It is to this opening that I have applied my temperature-determining apparatus, which consists of a chamber communicating with the atmosphere through the medium of a pet-cock. In the center of the chamber in question there is placed the bulb of a thermometer graduated to 120 degrees Centigrade. The thermometer is held fast in place by a packed joint and protected from injury by a casing.

In order to ascertain the temperature of the interior of a tire immediately after the conclusion of a race, or after having been run at high speed for any length of time, it is only necessary to remove the valve cup of the tire and substitute in its place the pressure gauge, press the button in order to permit the hot air from the interior of the tire to escape into the chamber containing the thermometer, and a double reading may be taken—that of pressure of the expanded air and its temperature. In order that the latter may more closely approximate the exact temperature of the interior of the tire, it is necessary to open the pet-cock slightly, thus allowing the air to escape slowly. Otherwise the metal of the gage and of the containing chamber would be apt to rob the small amount of air necessary to fill the chamber but once of such a large proportion of its heat as to render the reading worthless. After the air has been escaping through the pet-cock for half a minute or so, the entire apparatus reaches a uniform temperature and the reading practically represents the condition of the interior of the tire. Experiments with the device should reveal some interesting facts in this connection, as little or nothing is definitely known on the subject of tire temperatures apart from the fact that is a matter of common knowledge they do get most uncomfortably hot when run very fast—a condition that is not conducive to longevity.

\*Translation from the *Bulletin Officiel de la Commission Technique de l'Automobile Club de France* by Charles B. Hayward.

CHASSIS-TESTING PLANT OF AMERICAN LOCOMOTIVE WORKS.

### THE BERLIET CHASSIS-TESTING PLANT.

In addition to being constantly on the alert to devise new methods of construction as well as to obtain the very best materials procurable, the automobile manufacturer had found it incumbent upon him to subject his product to more and more strenuous tests before turning the cars over to the purchaser. The practice of running-in the motor while driving it by external power in a flood of lubricating oil, and that of giving it a thorough test on the stand under its own power and with its own accessories, is quite usual, as is also that of thoroughly testing the complete chassis out on the road. A final step in these numerous testing processes has been introduced by some of the factories, among them the American Locomotive Works, of Providence, R. I., the builders of the Berliet. The accompanying illustration pictures the new chassis-testing plant of this firm, so that not alone the motor, but the efficiency of the transmission as a whole may be tested and its operation followed under the equivalent of actual operating conditions. The power is absorbed by a hydraulic brake similar to that used in the motor-testing plant, and is measured by a Giddings recording dynamometer, registering the horizontal pull in pounds, while the peripheral velocity of the driving wheels is indicated by a tachometer, giving the feet per minute factor for the horsepower calculations.

The driving wheels of the car rest upon two wrought steel drums approximately seven feet in diameter by sixteen inches face, the latter being coated with a material producing a coefficient of friction between the tires and the wheels, which is equivalent to that of dry macadam. These drums are carried on pillow blocks set in a pit, one end of their supporting shaft also carrying a two-speed sliding gear to which the hydraulic brake is attached. The latter is of the same type as that described in *THE AUTOMOBILE* recently in connection with the brake tests of the Berliet motors. Every American Berliet chassis after finishing its road test is placed on this dynamometer and put through a series of tests on the different gears and at speeds varying from the minimum to the maximum of which the car is capable.

### SEEKING GASOLINE SUBSTITUTE IN ENGLAND.

Consul Albert Halstead, of Birmingham, England, reports as follows on the efforts now being made in the United Kingdom to find a substitute for petrol (gasoline) as motor fuel:

The advance in the price of petrol, due to the more general use of motors for pleasure and commercial purposes, and the certainty of an increasing demand because of the immense development of the motor industry, leads to efforts to find a suitable substitute for this fuel. Then there is apprehension that petrol may be raised more in price than is legitimately justified by its greater use, because motorists are so dependent upon it. As possible alternatives or substitutes, crude petroleum, paraffin (kerosene), shale oil, benzol, alcohol, and acetylene are mentioned in "Motor Traction." Some of these, though unsuitable for use alone, are said to give better results when combined with another hydrocarbon. Crude petroleum is regarded as unsatisfactory because of its heaviness, except in specially designed engines, such as are not now generally in use. Paraffin, though efficient and powerful, is held to be objectionable because of the difficulty of starting up an engine from the cold, and because the oil has a tendency to creep over the motor and injure its contents. It appears, however, that

the use of a small amount of petrol makes paraffin more adaptable, but this can be advanced in price as easily as petrol if it should come into use as a motor fuel. Shale oil is obtained from a bituminous shale found in the coal of the Midlothian district. Though it is said to have good results, the supply is comparatively small. Acetylene has been used successfully when combined with paraffin or with alcohol, and when water is injected into the cylinder of the engine during the firing stroke. It is feared it will be found too costly under present conditions of manufacture, but it is argued that a tendency to use acetylene might easily result in reducing the cost of manufacture; used by itself it is thought to be likely to strain and damage a motor engine, through the great force of its explosion.

Alcohol and acetylene have been combined experimentally for motor-fuel purposes with some degree of success, but the difficulty is in ascertaining what should be the relative proportions of the two ingredients. This combination cannot, it is felt, become commercially useful in the United Kingdom for motor purposes until alcohol can be produced much more cheaply. The high inland revenue tax now keeps up the price of alcohol, though it can be produced very cheaply from many substances of little value. If alcohol alone were used for internal combustion engines, the design of such engines, it is said, would have to be changed to insure complete combustion. The difficulty in starting an engine from alcohol because of the cold can, it is asserted, be overcome by using either a vaporizer or a burner or a small quantity of petrol in the initial stages.

Benzol is regarded as perhaps the alternative fuel most likely to aid in the solution of the question. It is produced during the distillation of coal at gas works, and it is thought that it can be manufactured in sufficient quantities and sold at a fair price if the demand arises for it. It is more powerful than gasoline, and experiments made with it are said to have been most encouraging, although the small percentage of sulphuric acid it contains gives rather an unpleasant odor to the exhaust.

With the amount of investigation that is now being made on the subject of a substitute for gasoline, which is constantly increasing in price, it would seem as if considerable knowledge of value to the automobilist should be forthcoming.

### SOMETHING NOVEL IN THE LINE OF PROTECTORS.

Whether the inventor of the Mandeville steering wheel Auto-Muff would have won the prize offered by an enthusiastic French autoist for a device of this kind a few years ago cannot be said, but it is only necessary to note the simplicity of the device as pictured by the accompanying photograph to see that it has merit and is well designed to accomplish the object in view. Perfect protection is afforded both the arms as well as the hands, and at the same time the control or ease of handling the wheel is in no way interfered with. Two different styles are made, the one for summer consisting of a lightweight rubber cloth that is both rain and windproof and which is so compact as to be readily carried under the seat, while the winter style is leather-covered and fur-lined, making an extremely warm combination when the best gloves made are none too much protection against the biting cold which bothers the driver's hands more than anything else.

MANDEVILLE AUTO-MUFF FOR COVERING STEERING WHEEL.

# ON THE LIGHTER SIDE OF TECHNICAL MATTERS

By CHARLES B. HAYWARD.

IT is quite safe to say that nothing has done so much to educate the man in the street on mechanical matters to anything like the extent for which the automobile is responsible. Further, it has done more to arouse an enthusiastic interest and a desire for information on technical matters on the part of the average layman than have the combined inventive results of a quarter century of the most marvelous progress the world has ever seen. Naturally enough a thorough knowledge of any piece of mechanism, or of its underlying principles, is not to be gained by scraping a bowing acquaintance with it; such lore as may be accumulated in this manner must necessarily be purely superficial even though it does permit its possessor to talk learnedly of what a newspaper man has aptly characterized as "that bunch of go-dinkusses and duffickers called an automobile." In the acquisition of this store of knowledge on the part of thousands who truly did not know enough to distinguish their right hand from the left when it came to things mechanical, it was inevitable that many highly amusing situations should be brought about, and it is the object in the present instance to review a few of them. To the wise ones, they are one and all mildewed chestnuts, but unfortunately the category referred to is not an extensive one, so that both the country at large and the automobile industry is safe for some time to come.

## The Old, Old Tale of the Missing Cylinder.

Probably the man who invented the missing cylinder story was responsible for the advent of an epidemic of similar crimes, but however that may be, the idea was a clever adaptation of a quasi-technical term—a bit of the current automobile vernacular in brief, to an existing situation, the recital of which has been responsible for many a smile. It was originally told—if the actual origin or the natal form of such circulatory whisps can ever be really traced—regarding an old lady who was out driving in the park alone with her chauffeur. The latter brought the car to a stop several times by the roadside and tinkered with something under the bonnet, while the old lady maintained a posture of dignified serenity in the tonneau, one of those lady-with-the-parasol-in-the-brougham attitudes, utterly oblivious of the interested group that watched John try to fuss about and keep his livery immaculate at the same time. After two or three such halts, womanly curiosity got the better of mi-lady and she inquired. "John, what can the matter be? Why are you stopping so often to look at things?"

"A couple of the cylinders is missin', ma'am, and she don't pull well," replied the puzzled ex-jehu.

"Well, are you quite sure you did not leave them behind in the garage, John?"

This naturally precipitated a host of "missing" stories based on the same fundamental idea, though probably the cleverest modification was the work of a Chicago scribe, who twined his recital about a "Cholly" boy who had a plethoric bank account and "nothing on his mind but his hair." All attempts to sell him an automobile had hitherto proved futile, his chief amusement consisting of chair-warming in one of the windows of his club. A mutual friend finally introduced a Chicago dealer, who managed to land an order for a high-priced car with all the "trimmings" he could possibly think of to bring up the amount of the bill. The new owner engaged a high-priced chauffeur and invited his friends for a trial run. Not many miles out of the city there were signs of trouble, and the chauffeur began to tinker about the motor to the host's great surprise.

"Now, what on earth is the matter?" he inquired peevishly.

"The motor's missing, sir," replied the hired man in the uniform.

"Just as I expected," retorted his employer for the benefit

of his guests. "Even your friends do you. I trusted that man to get me the best machine on the market and to see that I got everything that ought to go with it, and now there's something missing. I'm going back to the city to get that motor if it costs me ten dollars for a cab."

Would-be wise owners are also responsible for many of these "breaks," not a few of which are highly diverting, to say the least. For instance, a quite newly fledged owner, who was riding beside his driver while treating some friends to a spin, took occasion to ask his hired man some questions in order to display his knowledge.

"Why doesn't she pick up better on hills?" he inquired, as the motor slowed down and began to labor, due to the fact that the driver was trying to take a rise on the high gear that was too much for the car.

"She's losing compression," was the reply.

"That's so," remarked his employer in a relieved tone of voice, "I thought I heard something dropping back there," and he looked anxiously back along the road to spot the lost compression lying on the dusty highway.

## Those Who Like to See the Wheels Go Round.

The man who is never satisfied with any piece of machinery that comes into his possession until he has taken it to pieces to investigate its interior, usually finding himself in a predicament when it comes to reassembling it, is also responsible for not a few of the gems that go to make up the shining array. One, for instance, and a minister at that, bought a motorcycle, and after he had had his first ride on it—it may have been before, for that matter—started to dismantle it and distribute its various component parts round about the adjacent scenery, so that by no possibility could he find them handily when it came to putting the machine together again. He got the cylinder off and took the piston out, and then and there he made a most wonderful discovery. Every one of the piston rings was broken! He immediately took to pen and ink and wrote the manufacturer of the machine a sermon on the evils of trying to deceive innocent purchasers such as himself by sending out a machine in such a condition. He would please forward a new set of unbroken rings immediately or the motorcycle would be returned at his expense and he would be sued for the money.

Another equally good one that concerns the owner of a motorcycle relates to the oft-used theme of compression. He had had his machine for some time and it had given good service until recently when it failed to develop its customary power, would not climb hills formerly made light of and more to the same effect. The owner was the only motorcyclist for a good many miles round, and his only haven in case of need was a bicycle repairer, whose knowledge of such things probably did not greatly exceed the legitimate allowance, though he correctly diagnosed the case by informing his inquirer that what was needed was "more compression." Whereupon the motorcyclist, quite satisfied at having learned the trouble, was at pains to sit down and write to the maker requesting that he kindly forward him a "package of compression by express" as the machine was quite useless without it.

This was equaled, if not exceeded, by the plaint of the buyer of a new car who found it impossible to make the motor go, close following of the maker's instruction on every point to the contrary notwithstanding. He then set out to make an investigation on his own hook and was quite satisfied that he had found the root of the trouble when, on dismantling the muffler, he discovered a peculiarity of its internal construction with which he was evidently not very familiar. The usual irate letter to the manufacturer telling him how little he knew about automobiles

in general and how very little he knew about the particular one that he had sold or rather palmed off fraudulently to the writer of the letter. "How on earth can you expect me to make your old machine go," he concluded, "when the pot on the end of the pipe that comes from the motor is as full of holes as a sieve?"

#### Newspaper Men Among the Worst Offenders.

But, after all, the tyro and the beginner are not the only ones who fall by the wayside when it comes to realizing the limitations of their own knowledge where the technical side of automobiling is concerned and who fail to go slow until sure of their ground. The foregoing are naturally but a few of the very many stories of this kind that could be told—new ones are coming to light every day, though the old ones seldom fail to bring a laugh. In fact, it would require a small volume to do justice to the number of these tales now current and many of which are destined to live for years to come, if not as long as the automobile lasts, through the unending repetition that is given them wherever autoists congregate. Many of the stories told of the landlubber and the greenhorn on a yacht are the same to-day as they were a century ago, so it is reasonable to believe that a few of the automobile classics will suffer the same fate.

I presume an apology should really be in order before dragging the following to the light again, as within the inner circle an attempt to tell it is usually heralded with groans and it is universally regarded as one of the many that will simply not down. But then the inner circle is a very small thing, indeed, and there are doubtless far more autoists who have never heard it than the reverse—probably a hundred to one would be a good proportion. It seems that an elderly woman had met with a most peculiar accident in which an automobile was the chief aggressor. In short, she had simply been run into and knocked down at one of New York City's bad traffic spots—the corner of Forty-second street and Broadway. She was not killed, nor in fact very badly injured, despite the fact that both her age and the speed of the car in striking her were certainly not in her favor. Had there been no other circumstances connected with the accident, it might have passed almost unnoticed as but one of the many that appear to be inevitable, whatever the nature of the vehicle, under such crowded traffic conditions and careless humanity in getting in the way of moving objects. But the car caused the woman to measure her length directly in front of it and then passed over her without the wheels touching her; after it passed her clothing was found to be in a brisk blaze. There must have been an automobile "stringer" on the spot and he took two of the scribes representing leading New York dailies in tow and told them all about how it happened. As a result there was a front-page story in two of the next day's morning papers to the effect that a woman had been run down by an automobile and her clothing had caught fire from "a hot coal which dropped from the carbureter." A handy policeman extinguished the flames promptly, but it never developed that he found any hot coals or any ashes to explain the cause of the fire. The motor must have been running on a very rich mixture or with the spark very much retarded, with the result that the charge was still burning as it issued from the muffler, so that it was the exhaust which set fire to the woman's clothing as the car passed over her.

Then there was the two-column Saturday evening automobile story, which one New York daily makes a specialty of, that quoted Joe Tracy at great length on the peculiarities of the internal combustion motor, after reading which most of his friends thought the honorable Joseph, of racing fame, must have either been out the night before or had got his theories mixed. Of course the inner circle was wise; "green reporter" explained things, but a reference to the fact "that the carbureter pushes the piston up and down in the cylinder on which account the stroke cannot be lengthened," or something equally accurate, will still cause Tracy to smile audibly and look distinctly weary.

It would seem as if the fraternity must have missed an ex-

cellent opportunity to perpetuate a good show-time story by not patterning after Mark Twain's amused query at the end of a lengthy and much involved explanation of the working of the automobile, from beginning to end. The well-known humorist had requested to be inculcated into the mystery of transforming gasoline into speed and the demonstrator had been at pains to describe every step in the operation down to the last detail, including the characteristics of each part of the mechanism in its function of transmitting the power. \*

"But what makes the car go?" asked the writer, in a most puzzled tone of voice at the end of the long explanation.

But getting into the realm of the demonstrator's and salesmen's stories opens up too broad a trail to pursue much further, as the number of these that can be told is only limited by the memory of the teller. Their name is legion and a booklet filled with them would make interesting reading. To cite but a single instance, there may be recalled the "spiel" of the new salesman who reduced the explanation of the motor's working to the vernacular. "You see," he said to the seeker after information, "a lump of gas is sucked into the inside right here, the piston comes up and hits it a whack, the spark jumps in and there you are," he concluded, with a flourish that could not be equaled by the solver of the most involved problem with his final *Q. E. D.*

#### HOW TO SELL AUTOS IN BRAZIL.

Consul-General George E. Anderson, of Rio de Janeiro, sends further particulars concerning autoing and automobiles in Brazil. He says that French machines are most admired, and that the Brazilian coffee producer has the conviction that the French automobile is the only one on the market worth considering. The Consul-General adds:

"Practically all of the French machines are represented by up-to-date agents in the field and the men in the garages understand French machines better because they work with them more, and, perhaps, because of other reasons. To get a Brazilian interested in an American car is difficult, but it is done nevertheless, and after he is once interested and after he investigates there is a chance of selling him an American machine, provided that at the same time he is willing to do business as the American company says he must—meet its terms, subscribe to its specifications, bear with more or less careless manner of shipment on slow steamers, and in other ways and manners depart from the accustomed methods of doing business in Brazil. One must appreciate the hold of French and other European motor cars upon the Brazilian market.

"The Brazilian motor buyers just now want as large, fast, and reliable a car as they can get for city use, one that will seat as many people as possible. A superabundance of power is a defect generally, and is a requisite in the case of only a few cars whose owners make a specialty of scaling a mountain range. Brazilian motorists are inclined to low, rakish, European machines. They like plenty of brass and showy accessories, and when they buy they want time. The dealer wants time to sell the machine and the buyer wants time to pay for it. The dealer is willing to pay interest from date of invoice, and will furnish good reference.

"I know of only two traveling representatives of American motor-car makers here now. Both are doing well. It is unfortunate that many American manufacturers seem to think they can do business with Brazil at long distance. With a traveling agent, a local agent follows as a matter of course. There seem to be plenty of Brazilian business men ready to make contracts for the sale of American autos when once an agent places the matter before them fairly. To properly push American machines there must not only be American agents to sell them, but local men to look after them when sold. The lack of good mechanics for repair work is felt by all makers. It is felt especially by American representatives, since with the great number of European machines here the latter are better cared for.

"Motor men who have been here representing American concerns have seemed to be very well pleased with what they have done. Their chief business has been done in Rio de Janeiro and Sao Paulo. They have come down the coast from Pernambuco, and most of them leave for Buenos Aires or Montevideo from Santos. This has been a mistake on the part of some of them, inasmuch as some of the best, if not almost the only good roads in Brazil are in Rio Grande do Sul, and the government of that State has been granting concessions to syndicates to place lines of automobiles in service between certain cities not served by railroads."

## LETTERS INTERESTING AND INSTRUCTIVE

### Using Non-Vibrator Coils with Two-Cycle Engine.

Editor THE AUTOMOBILE:

[801.]—Being a constant reader of your valuable magazine, I want to inquire if the non-vibrator jump-spark coil can be successfully used on a two-cycle engine, two-cylinder, or will I have to use an independent vibrator, and will one of these do for two coils?

I think this will be of interest to others, and I would like to hear from some that have tried this method; in case I use the independent vibrator, what size wire should I wind the small magnet with and how many turns, also give diagram of the wiring. Any information you can give me on this subject will be very much appreciated.

Could I also use a two-cycle vertical engine in an automobile by laying it down flat with the spark plugs toward the dash? In case I use the engine this way, would the splash system oiling work as well as when run vertical?

West Liberty, Iowa.

FLORENCE.

There is nothing to prevent the use of a non-vibrating jump spark coil on a two-cylinder two-cycle engine, nor, for that matter, on any type of automobile engine. Coils of this kind were long a feature of some well-known makes of French cars and are still employed on motorcycles to a very large extent, particularly in this country. So far as their electrical operation is concerned, this has been found to be superior to that of the usual type with a trembler or vibrator, as they are much quicker and surer in action, approximating the service given by a magneto in this respect, but mechanical difficulties connected with their use have been such as to render them impractical, so that except in connection with a magneto the non-vibrating coil is practically obsolete on the automobile. The reason lies in the fact that a quick, sharp break of the primary circuit is essential, and it has not been found possible to construct a contact breaker that will accomplish this and still be sufficiently durable in constant service for practical purposes.

You will not need an independent vibrator and particularly not an electric one, in order to use a non-vibrator coil with your engine. A mechanical contact breaker that will meet the above mentioned requirements is all that is necessary. The scheme of using a separate electrical vibrator in order to operate the coil is entirely impractical on the car, chiefly due, not alone to the complication of the apparatus involved, but also to the largely increased current consumption. If you have an opportunity to inspect an old De Dion motor in your vicinity, you may see the type of contact breaker used with a non-vibrator coil, unless the motor you find has been rebuilt in this respect. If you still wish to try an electrical independent vibrator, the cheapest and easiest way to improvise one would be to take an electric bell, which can be purchased as low as twenty-five or thirty cents, and simply remove the bell and hammer. This will give you a vibrator designed to run on battery current and one much better made than the average amateur could turn out. The wiring is so simple that a diagram is unnecessary to understand it. Connect one battery wire to one terminal of the primary, or heavy winding, of the jump spark coil; lead the other battery wire to one terminal of the bell winding and connect the other bell binding post to the second terminal of the primary coil winding. The secondary connections are the same as ordinarily used, direct from each coil to the plug, where there is a coil for each cylinder, or to the distributor and thence to the plugs, where but a single coil is used, this usually being the case with a non-vibrating coil.

There is no reason why you cannot place a two-cylinder two-cycle engine, ordinarily designed to be used in a vertical position, in a horizontal position in your proposed car. The splash system of lubrication has been found to give perfect satisfaction with horizontal automobile engines, though some modifications might be necessary to adapt the motor you have to this purpose, as it was not originally designed therefor and trouble might otherwise be experienced with its use in the new position.

### Advisability of Installing an Auxiliary Exhaust.

Editor THE AUTOMOBILE:

[802.]—I am a constant reader of "Letters Interesting and Instructive," and have noticed several articles about the auxiliary exhaust as being a great improvement applied to certain motors. We have a four-cylinder, four-cycle 4x4 air-cooled motor, which will overheat if used on low speed very much. I have thought of putting on auxiliary exhausts. The builder of the motor advised us not to do so, saying that the cylinders would be apt to get out of round, etc. My idea is to make 3/4-inch round holes in the cylinders near the bottom (to commence to open 40 degrees before the end of the stroke), then pipe from these holes to the main exhaust pipe (1 1/4), not using any valves. The regular intake and exhaust valves are operated by push rods. Of course two ports would always open together.

I would like your opinion on such an arrangement.

Moline, Mich.

SUBSCRIBER.

We concur in the opinion of the builder of the motor in not recommending the installation of an auxiliary exhaust, but not for the same reason. There is very little to be feared from the cylinder becoming out of round or other similar damage occurring to it, if the work is properly done, but we think it is very doubtful if the result will be an improvement that is worth the trouble involved in making it. Instances have come to our knowledge where old single-cylinder motors as used on motorcycles have been improved considerably by the use of an improvised form of auxiliary exhaust such as you mention, but they can hardly be said to form a precedent for the same thing in connection with a four-cylinder engine. While we cannot lay claim to having had any personal experience with such an engine, we have always understood that the makers of the Franklin car, who are the exclusive builders of an air-cooled motor with an auxiliary exhaust, did not find the latter entirely satisfactory until valves were introduced in connection with it. Though termed an *auxiliary* exhaust, as used on the motor in question this would appear to really constitute the exhaust proper, while the ordinary exhaust valves are utilized to permit the escape of the remaining hot gases swept out by the piston on what is virtually a scavenging stroke and which is one of the chief contributing elements to the wonderful efficiency of these motors.

### An Australian Favors American Two-Cycle Cars.

Editor THE AUTOMOBILE:

[803.]—Enclosed please find P. O. money order for 18s. 9d. in payment of my subscription to "The Automobile" to December 31, 1908. My present subscription runs out on June 27 this year, and so as to make it expire at the end of the year I am sending you a renewal for a year and a half. As I keep my old copies of "The Automobile," I would be pleased to receive index numbers for the past couple of years, say 1905 and 1906, and as they appear in future issues. This will save me a lot of trouble in looking up anything I want to find in back numbers.

I have a 16-horsepower, four-cylinder Minerva car, and have run it about 2,500 miles. It goes well, but I think I will try an American car next time and of the two-cycle type, as I notice by your paper that there are now several makers in this line. You will remember me asking about the Elmore car and requesting that some questions be inserted in "The Automobile" for me, but you did not do so, and by not doing so I inferred that the Elmore was not the best of cars and so did not give them my order. The "Autocar" often inserts questions asking motorists' opinions of different cars. I should often like to ask questions through "The Automobile," but it takes so long to get a reply, and you do not seem to go in for answering questions like some of the papers do.

Glenslov, Young, N. S. W.

J. H. McFARLANE.

Unfortunately we do not recall your ever having asked us any questions regarding the Elmore car, as they certainly would have been given due attention under this heading. Either your letter did not reach this office, or, containing a communication to the subscription department, this was attended to and the letter then placed on file inadvertently without being referred to the editorial department. We regret that you should have come to the

somewhat strange conclusion that you mention through our failure to answer the question as anticipated, particularly as this was the deciding factor in the placing of your order, though we presume it must be somewhat discouraging to indulge in further letter writing when a first communication goes unanswered and three months are required for a return mail. We are somewhat surprised that you should be of the opinion that we do not devote any energy to the maintenance of a correspondence department, as we have been running two to four pages of letters from subscribers right along and have been in receipt of numerous complimentary letters regarding the helpfulness of this feature of *THE AUTOMOBILE*. Our only restriction is that the letter should be of more than individual interest; there must be something of general interest to warrant publication, otherwise replies are made by mail. Regarding your reference to the correspondence department of the *Autocar*, we may say that the English are a nation of confirmed letter writers and doubtless the editor of that excellent journal could frequently fill an issue from cover to cover with letters alone did he so desire. To exaggerate a bit, an English autoist thinks accidentally dropping a wrench on his big toe while on a run sufficient provocation to fly to pen and paper and ask the editor if he does not think the manufacturer ought to know how to make a wrench that would not hurt. He not only writes one letter, but he sends a copy of it to every automobile paper he knows of. Hence the extremely well-padded letter columns. Americans have not contracted the letter-writing habit so badly and, moreover, would not wade through a lot of such trivial communications, though naturally all are not of this class by any means. We shall always be glad to hear from you on any subject of more or less general interest concerning automobiling for publication in this department, or if of personal interest to reply to the best of our ability by mail direct.

#### Will "Gasoline Sal" Kindly Oblige a Troubled One?

Editor *THE AUTOMOBILE*:

[804.]—I am a reader of your valuable magazine, and in your issue of June 13 one of your readers who signed himself "Gasoline Sal," to letter No. 783, interested me very much, and I would like to communicate with him.

He is able to get more mileage from a set of batteries than I ever heard of, and I would like to know what he is using, and particulars, as I am only able to get 600 miles on ten batteries with my four-cylinder machine.

Champlain, N. Y.

BERT F. PAINE.

As the sole object of the writers of letters who append such signatures as the one in question to their letters is to hide their identity, we are naturally not at liberty to divulge their names and addresses without their sanction. However, as you append your full address and the sponsor of the communication referred to is a regular reader of *THE AUTOMOBILE*, he will no doubt notice your request for further information as above set forth and correspond with you directly.

#### Why Do Seized Pistons Cause Damage, and How?

Editor *THE AUTOMOBILE*:

[805.]—Is it possible to allow a two-cylinder car to run without cylinder oil till it becomes so hot the engine stops on going downhill, without injury to the cylinders or pistons, and if they are injured in any way, how will the car show it, and in what way will you know whether either the cylinders or pistons have been damaged?

Hamburg, N. J.

O. E.

It is possible to run a two-cylinder or any other engine so long without cylinder oil that the pistons will seize and the engine will stop, even though the car be coasting and trying to drive it while going down hill, but it is doubtful if this can be done without at least some injury to the pistons or the cylinder walls. The stoppage is caused by the unequal relative expansion of the cylinder and piston, the latter finally attaining a size which would be slightly larger than that of the cylinder bore were it not restricted by the latter. But before it finally reaches this point it becomes large enough to exert considerable pressure on the cylinder walls and its continued movement is apt to scratch

or score the latter. This damage will be apparent on dismounting the motor, or if this is not done and the injury is considerable, the motor will show it by a loss of compression and a consequent falling off in power, the hot gases leaking around the piston through the channels thus made.

#### Information Wanted Concerning New York State Law.

Editor *THE AUTOMOBILE*:

[806.]—Being a subscriber of yours, I take the liberty of writing you for some information in regard to license in your state.

What license do they require for the owner or the operator of car, and from whom shall I make application for same?

An early reply will be appreciated, as I wish to use a car during the months of July and August and expect to take it to Chautauqua in about ten days.

Pittsburg, Pa.

ADDISON S. ALTAFFER.

As you are already a car owner and your automobile is duly registered in your home State, carrying a Pennsylvania identification number, you will not need to take out any license to bring your car into this State, and you may drive it within the New York State limits indefinitely, in which respect the New York law is far in advance of either the Pennsylvania or New Jersey laws, which do not recognize other State registrations. For full information concerning the regulations in force in the different States we would refer you to the *Automobile Blue Book*, which is very complete in this respect.

#### Some Reasons Why the Gear-Set Is Necessary.

Editor *THE AUTOMOBILE*:

[807.]—I have noted your recent article regarding the elimination of the change-speed gearing from the automobile. This was an editorial, and the opinion was expressed therein that there did not seem to be much chance of such a great improvement as this coming to pass—at any rate, not in the near future. I am very much interested in the automobile, but must confess that there are a great many things regarding it that I do not understand very well, and would like to trespass on your time to the extent of having some of them made clear. No doubt there are many others whom such an explanation will benefit.

For instance, you say "For very obvious reasons, this is one of those questions that simply will not down."

What are these reasons, or, in other words, why should it not be possible to eliminate the change-speed gearing or transmission by improving the engine still further? I have had some experience with stationary gasoline engines, and have had occasion to see quite a number of them working at different times, but have never noticed that it was necessary to provide anything of this sort in order to enable the engine to carry the load, no matter how much was put on it within its capacity. Why is this?

Can you also tell why the steam engine has such a great advantage in this respect over the regular automobile motor? Of course, I realize that the power is generated in very different ways, but in the end 10 steam horsepower and 10 horsepower from a gasoline engine are one and the same thing, are they not? Can it be that the method of production influences the use of this power? For instance, a locomotive will start a tremendously heavy freight train from a dead standstill, the engine hardly making a stroke per second in starting, but even a light automobile has to have its motor humming at high speed before the power can be applied. To choose an example nearer home, the steam automobile starts with the first puff of its engine, but the gasoline motor must be running quite fast before it can be used. Some light upon these, to me, puzzling questions, will be appreciated.

Newark, O.

PUZZLED.

Your questions regarding the necessity for employing a change-speed gear on the automobile go to the very root of automobile engineering, where the application of the internal combustion motor to a road vehicle is concerned. While it may be natural to compare the stationary gasoline engine with the automobile motor in this respect, a little consideration will serve to show that the service rendered is no more alike than that of the stationary engine is to that of the locomotive hauling a heavy train of loaded freight cars, which you cite.

Stationary engines are usually designed to carry a more or less steady load; though, as you say, they will operate without the necessity of any intermediate steps in the way of gearing from practically no load up to the extent of their capacity, which would seem to place them in somewhat the same category as the

automobile motor. The chief point on which the difference hinges is that of speed; that of the stationary motor can be regulated so as not to vary more than 5 or 6 per cent. regardless of the load, but this is not possible with the automobile motor. The stationary motor is essentially a slow-speed power generator, many of them running at but 200 to 300 r. p. m., and it will be evident that such an engine can stand a great reduction in speed and still develop a large proportion of its rated output. For instance, a 25 per cent. drop in the 300 r. p. m. engine would only mean a reduction to 225 r. p. m., whereas the same drop in an automobile motor, designed to run at 1,000 r. p. m., would mean a reduction to 800 r. p. m., so that some form of gearing is imperative to permit the motor to run as closely as possible to its normal speed.

The difference between the steam and gasoline engines is even more marked. A single-cylinder double-acting steam engine is the equivalent of eight four-cycle gas engine cylinders, so far as the number of impulses received is concerned; the former receives two per revolution while the latter gets but one every other turn in each cylinder, so that this number is required. This is not the only difference, however, as the steam exerts its power expansively throughout the greater part of the stroke, whereas the explosion in the gas engine cylinder expends the greater portion of its power before the piston has traveled more than a third of its stroke. The steam engine action may be compared to an irresistible ram at slow speed, while the gas engine produces a blow, and it will be evident that a number of blows quickly repeated are necessary to equal the pulling power thus exerted, hence high speed is essential in the latter. This also enables the steam engine to start under load. The gas engine's reserve power lies in its running at normal speed, while that of the steam engine is pent up in the boiler. Ten horsepower always represents that amount regardless of the manner in which it is developed; but to make a ten-horsepower gasoline engine develop that much energy it must be run at the proper speed. To put it technically, the torque curve of the gasoline engine drops off at an alarming rate with a decrease in its speed, so that it has little power comparatively when running much below its normal r. p. m. rate.

**CORRECTION REGARDING FRANKLIN MOTORS.**

Editor THE AUTOMOBILE:

[808.]—In your issue under date of Thursday, June 6, we note an article on "Air Cooling of Automobile Engines," by our Mr. John Wilkinson. On page 930 there is an indicator card termed Figure 3, which is supposed to represent a card from a Franklin engine, on which is marked the point where the auxiliary exhaust opens, and attention is called to the effect of the auxiliary exhaust. Instead of this card being from a Franklin engine, however, it is in reality from another make of automobile.

It can be seen on this card that the back pressure at the end of the stroke is very high, and on the cards which we are sending you, at the same time, the effect of the auxiliary exhaust upon our en-

auxiliary, and by so doing maintain a lower minimum temperature in the cylinder wall. However, to one having an engineering education, it is possible to deduce these from the cards and the advantage of the auxiliary exhaust is very evident. To the layman the great drop in pressure is apparent, and there is no question that the elimination of back pressure at the end of the power stroke is a tremendous advantage.

These cards were all taken from a Schultz manograph and are to our way of thinking very reliable cards and very excellent records. Syracuse, N. Y. H. H. FRANKLIN MFG. COMPANY.

**MORE ABOUT THE ROADS ENTERING PARIS.**

Editor THE AUTOMOBILE:

[809.]—Supplementing the letter of "W. F. B." in "The Automobile" of May 30, concerning the roads in and out of Paris, the writer of these lines acknowledges gratefully the correctness of the statements therein. There is, however, rather more pavé—all the way from Chatou to Nanterre and Puteaux—than your correspondent admits, and it is only avoidable by literally "finding one's way" via Ruell, by a crossroad none too plainly marked.

From Versailles the good road into Paris starts out by being a good road, but like the curate's egg, it is good only in parts, for it descends into the classification of a Chemin de Grande Communication, and the truckman and market-wagon driver who ought to keep to the Route Nationale, which goes by the way of Viroflay, goes where he pleases and makes the terrors of one road as great as those of the other, and incidentally damages a good road surface far more than the rouges ferrés or the antiderapants of the automobilist. The fault of all roads entering large cities and towns lies in the mixed classes of traffic which they carry.

The point the writer wishes to affirm is that the roads in and out of Paris are—as they are bound to be by nature and under existing conditions—entirely unworthy, and not at all suited to fast automobile traffic. The habituated Parisian chauffeur or the octrol smuggler knows some by-paths, no doubt, little frequented and perhaps possessed of good surfaces all of the way, but for obvious reasons they are not practical for the stranger tourist, and anyway the modern well-bullt and well-sprung automobile robs bad roads of a certain amount of the terrors which ruined many a gas-pipe chassis in the old days. It is the class of road and the class traffic, combined, that make the entrance to Paris so disagreeable.

The plea of the writer is for automobile, or "fast traffic," entrances and exits for large towns and cities, and encircling boulevards (as are so frequently found in France), which will enable one to pass around rather than pierce the heart of some old-world town with crooked, badly-paved streets. This is the case at Rambouillet, as your correspondent suggests, but these encircling roads should be better marked than they are.

The little pocket map, reduced from that of the Service Vicinal, shows plainly how bad the exits and entrances of Paris really are. It is because all classes of tax-paying traffic have a right thereon. Some day, surely, there will be automobile roads pure and simple as accessories to all large towns and cities, and Paris may be depended upon to have them as soon as possible, but why should not America inaugurate the idea? It is the automobilist, the man behind the wheel, who is to be the molder of public opinion, so let us all hang together.

Les Andelys, Eure.

FRANCIS MILTOUN.

**REGARDING THE RITES INERTIA GOVERNOR.**

Editor THE AUTOMOBILE:

[810.]—Relative to your reply under "Letters Interesting and Instructive," No. 772, June 6th issue, "The Automobile," page 935, you advise that you do not know the "Rites governor."

The writer would state that on page 189 of Gillingham's "Oil Engines," there is an illustration of the "Rites inertia governor," as applied to gas engines. This governor was originally gotten up for use on steam engines and then arranged to operate and change the point of cut-off. This is considered one of the most efficient types of the inertia governor ever gotten up. It was patented by Mr. Rites, a Cornell Civil Engineer School instructor.

Hoping this may furnish the desired information, I am, New York City. FRANCIS G. HALL.

**A SOLUTION FOR CARBURETER POPPING.**

Editor THE AUTOMOBILE:

[811.]—Regarding the trouble complained of by J. C. Moore in a recent issue, all else being right, it seems that the entire trouble is in the carbureter. At high speed there is not enough gasoline to mix properly with the increased amount of air taken in. Would advise making the hole where the gasoline enters the carbureter a trifle larger. I think if he will run his motor at a high speed he will find that the gasoline level in the carbureter is way too low—in other words, the gasoline does not come into the carbureter as fast as it goes out; in which case it will surely backfire.

Los Angeles, Cal.

GEORGE ARBUCKLE.

BLUE PRINT No. 13. BLUE PRINT No. 15. BLUE PRINT No. 7.

gines is very evident, a drop in pressure from a probable 45 lbs. down to anywhere from 1 to 4 lbs. This is the great advantage of the auxiliary exhaust, and it is our opinion you would like to correct this and show the true results as given by Mr. Wilkinson.

The three cards that we are sending you are as follows:

Blue Print No. 13—H.P., 10.75; R.P.M., 700; Cyl., No. 3.

Blue Print No. 7—H.P., 15; R.P.M., 1,000; Cyl. No. 2.

Blue Print No. 15—H.P., 20.4; R.P.M., 1,200; Cyl. No. 4.

You will note from this list that we are giving you three different cards at three different speeds and at practically 10, 15 and 20 horsepower. These cards show very decidedly the great advantage of the auxiliary exhaust.

Of course these cards, being indicator cards, not only show the wonderful drop in pressure, but show at the end of the power stroke that there is practically no back pressure upon the engine when the piston starts back on the exhaust stroke. These cards do not show the large amount of heat which is carried out through this

JUDGING from the present rate at which new cars are making their appearance in the Middle West, it seems to be a foregone conclusion that this part of the country is destined to be the center of the automobile industry in the United States. The latest arrival to bid for favor is termed the Halladay and is the production of the Streator Motor Car Company, Streator, Ill. The mainstay of the line is the 35-40-horsepower touring car known as Model B, which forms the subject of the illustration at the head of this page. A glance at the photograph shows that it is patterned on attractive and business-like lines so far as outside appearance is concerned, while a review of its specifications shows it to be designed after sound and well-approved engineering standards. The power plant consists of a four-cylinder water-cooled 35-40-horsepower Rutenber motor, the chief characteristics of which are too well known to require description.

Ignition is of the high-tension type, using a set of six-volt seventy-ampere hour accumulators as a source of current supply, with a supplementary battery of dry cells for emergency use. For the former a Duro storage battery is regularly supplied, while the coil is of the four-unit dash type and of Splittdorf make. In fact, particular pains have been devoted to making the equipment representative of the highest grade accessories that the American market affords, as will be evident from the use of the latest pattern Schebler carbureter to provide for this essential of the motor and a Hill Precision sight force feed oiler to take care of the lubrication. A Briscoe radiator of attractive outline forms the mainstay of the cooling system and is supplied by a gear-driven pump as well as being supplemented by a fan.

The groundwork of the chassis consists of a pressed-steel frame of the standard channel section and of substantial weight, heavily reinforced. This is carried on four well-proportioned semi-elliptic springs, the running gear consisting of 34 by 4 inch artillery wheels, carried on double ball bearings. Four-inch tires are fitted front and rear and while Diamonds on Marsh quick detachable rims form the regular equipment, the purchaser is given an option on this essential. The front axle is a one-piece drop forging of the customary I-beam section, with considerable drop under the motor, while the rear axle is an example of the latest improvement in the floating type. In this the weight of the car is entirely carried by the housing and the driving portions are readily removable for inspection and repair. The change speed gear is of the sliding pattern, with progressive form of operation, and provides the usual three forward speeds and reverse. It is supported about midway the length of the chassis on substantial cross girders, with a short shaft for the final drive, compensated by universal joints to provide against vertical and lateral play.

The clutch is of the standard conical type that is still favored by such a large number of makers, despite the improvements made in the multiple disc form. It consists of a leather-faced cast-aluminum cone engaging a recessed member made integral with the flywheel. A series of helical springs is placed between the aluminum cone and the leather facing, thus insuring steady and gradual engagement, as well as minimizing the wear on the facing and preventing its burning out, which was a common fault in earlier types. Four brakes are provided, two of the internal-expanding and two of the external-contracting type, all being centered in special hubs forming part of the rear wheel, in accordance with what has come to be regarded as the very highest form of standard practice for this important part of the car. The internal-expanding set constitutes the running brake and is pedal-operated, while the other set is the emergency and is worked by the hand lever. The latter is inter-connected with the clutch and its application disconnects the motor from the road wheels, both sets of brakes being properly equalized in order to prevent danger of side-slipping when suddenly used. The gear ratio of the transmission is designed to give the car a speed range of from five to fifty-five miles an hour on the direct drive or high gear. The wheelbase is 108 inches and the tread standard. Control is of the regulation type, employing small hand-operated levers placed on a stationary sector located over the steering wheel, while the coils, sight feeds and similar accessories are protected by a recessed dash formed of a curved steel stamping, brass bound. Fuel is fed by gravity from a tank located under the forward seat and having a capacity of fifteen gallons of gasoline, in addition to which an auxiliary tank is provided.

A laminated wood body, with divided front seats, attractively upholstered in durable leather and having a seating capacity of five to seven passengers, is provided, the tonneau being very roomy and affording plenty of space for the use of two revolving extra seats when desired. Rather an innovation has been introduced in body finishing by upholstering the rear face of the front seats, thus preventing the defacing of the varnish of this part of the car, as invariably happens under ordinary circumstances. Side doors are made amply wide and are hung so as to fold clear back over the mudguard, thus giving a full opening. The weight of the car all on is 2,600 pounds, and with the customary equipment of Solar searchlights and generator, as well as Solar side and tail lamps, horn, tool kit, and the like, the Halladay lists at \$3,000. It will be evident from the above that the makers have not attempted to introduce any startlingly original or revolutionary design, but have, in fact, assembled an up-to-date car from the highest grade of standard parts.

In line with its policy of devoting considerable attention to the production of commercial vehicles, the Logan Construction Company, of Chillicothe, O., has just placed on the market a new Logan light delivery wagon, which may be known as Model R and list at \$1,800. It is designed to have a capacity of 1,500 pounds useful load and will consist of a standard pattern of chassis driven by a four-cylinder 20-24-horsepower air-cooled motor. The frame is of the standard pressed steel type, with ample reinforcement, while the running gear consists of fourteen-spoke artillery wheels mounted on large hubs specially designed for the builders. The motor has been subjected to the most severe tests that its designers could possibly give it, and the successful outcome of the latter has proved beyond a doubt that it will more than fulfill the expectations of its makers. In view of the use to which it is to be put, the chief requirement is that it should show the maximum of efficiency and reliability in unskilled hands, and the fact that it is air-cooled tends considerably to the realization of this object. It has usually been considered by builders of gasoline-driven commercial vehicles generally that the matter of noise was something which they did not have to consider, and as a result some of these cars are most objectionably noisy. The builders of the Logan, on the other hand, have paid particular attention to this essential, considering it equally important in the case of the commercial as the pleasure car, and in consequence it is claimed that the motor of this new car is practically noiseless, due in large part to the special construction of its valve-operating mechanism.

The same painstaking study to make the power plant as simple as possible in order to meet every requirement of this exacting service under the lack of care usually accorded the mechanism by the

average truckman, has also been devoted to the other essentials of the car. The clutch has been designed so that disalignment is practically impossible, and it is also self-adjusting to an extreme point, while any taking up required may be effected in a very simple manner. The change speed gear is of the sliding type and is designed to give a direct drive on the high gear, with none of the pinions in mesh, to make the car absolutely noiseless. The countershaft is mounted on large roller bearings, with liberal end thrusts, final drive being by means of chain, long and careful experimenting on the part of the builders having demonstrated that this form of drive is not alone the most reliable but very much more durable under the trying conditions of commercial service. The chain is so placed as to give a direct pull and the radius rods are constructed so that the ends meet the centers of both the driving shaft and the rear axle, holding them rigid and equidistant, thus preventing all jerking movements of the chain regardless of the character of the roads. Four independent brakes are used, two on the rear axle, one on the countershaft, and one on the clutchshaft, the latter operating simultaneously with the disengaging of the clutch. This prevents continued rotation or spinning of the clutch in gear-shifting and facilitates the latter by an unskilled driver. Large universal joints are inserted between the clutch and the gear set, and between the latter and the countershaft. The matter of accessibility and ease of repair so essential in any commercial vehicle have come in for special attention and any part of the mechanism may be readily removed.

Every part of the mechanism is thoroughly encased, while the driver is protected by a glass wind shield and storm curtains, the body being of the regular solid panel order, with screen sides and end, the open space generous in size.

CHASSIS MODEL B LOGAN DELIVERY.

THE CURE DE GRAINCOURT AND HIS HOME-MADE AUTOMOBILE

SINCE tearful April was ushered in, a visit to the circuit on which Szisz, Wagner, Lancia and other speed kings will give their magnificent display this week has been the fashionable excursion of all Parisians. To follow the fashion, to visit charming old Normandy, and to inspect the circuit about which the whole world is talking, made a three-fold attraction far stronger than any that Paris can offer.

As Pierre Garcet fingered with the lever of a handsome Bayard-Clement, the artist, O'Galop, called out, "Don't forget to visit the Curé de Graincourt." "Entendu" came the brief response as the fast machine cut through the vigorous morning air.

It is only a run of about three hours to the track, but in much less time than that the peculiar charm which Normandy alone possesses makes itself felt to the traveler. Up the Seine Valley are vistas of the shimmering river, of ancient chateaux, of quaint Norman churches and solid picturesque towers, which cause a regret that they should be left behind so rapidly. Here is Eu. We are on the triangular circuit. Two kilometers ahead is the little village of Graincourt.

Over there to the right, peeping out above the mass of fresh spring foliage, is the white stone tower of the antique Norman church. A narrow, hollow road leads up to the small white sanctuary dominating the village from a small eminence. To the rear of the edifice is the *presbytère*, a modest dwelling just sufficient for the modest wants of the humble village curé. There is an electric bell—a rarity in unchanging Normandy. We ring, but nobody replies. From a low outhouse in the rear a cassocked figure comes out to meet us.

HIS SPIRITUAL WORKSHOP.

A tall, powerful, athletic looking man, used to manual labor, as is shown by the well developed muscles of his bare arms; an intelligent face, encircled by an iron-gray beard—a typical missionary fig-

broken a few spokes or bent a crank. My reputation grew; visitors to the seaside resorts heard that I was not a bad hand, and customers increased.

"Then the motor came along. I took to that naturally. Here is a little voiturette I made myself."

It was a low-built, simple little car, with a single-cylinder engine carried well forward and a plain wooden box behind the steering column; roughly finished, but showing considerable mechanical skill. At our request the curé changed his skull cap for a broad-brimmed wide awake, gathered up his long black soutane and posed for his picture, his handy boy and *mecanicien* sitting on the floor board beside him.

"This motorcycle is my own," continued the priest when the photographic operation was over. "It is catalogued 23-4-horsepower, but by tinkering with it I have managed to get its power up to three. I should like to do more, but it is too costly for a simple parish priest. What I earn from repairs helps me along a little with these experiments. After all, one can be a faithful priest, administer the sacraments, attend to confession, and handle the file and the wrench. Besides, it is useful to lots of people.

The door opened and the village postman stepped in. "Ah, you have come for your bicycle. It is not quite finished yet, *mon ami*, but you shall have it this afternoon. A few balls are broken and a bearing needs truing up."

He accompanied the rural letter carrier to the door, and stopped surprised at the sight of Garcet's Bayard-Clément. He raised the hood and remained in silent contemplation before the powerful cylinders, finally murmuring "*C'est tout de meme beau.*"

A run round the circuit was proposed. In a few minutes the greasy mechanic's soutane was changed for a clean gown reserved for ecclesiastical purposes. Garcet opened out, the indicator traveled round rapidly to 100. In the tonneau the Curé de Graincourt remained silent, the shadow of a smile on his lips.

ure. We are invited to the rear, into an open courtyard with several sheds leading off it. Three or four bicycles are turned upside down, in various stages of repair. There is a motorcycle, the motor dismantled and lying on the ground. Scattered about are empty gasoline cans, tools, oil cans, and the usual accompaniment of a mechanical repair shop.

"Are we at the village mechanic's, or at the curé's house?" one of the party asked.

"Both, monsieur," replied the curé. "I am the bicycle, motorcycle and automobile repair man of the district. For fifteen years I have been consulted by the inhabitants of the district on all kinds of mechanical difficulties. Formerly I was just an amateur mechanic; now it has become almost a trade."

"Why?"

"Well, times are hard, and the pay of a country curé is not sufficient for even his modest wants. Years ago I did a little bit of everything. Then the bicycle came along and I became interested in it. Little by little I became skilled in mechanics, and was often useful to members of my flock who had

WITH THE SWEAT OF HIS BROW.

# HOW FRANCE CONTROLS HER AUTOMOBILISTS

By W. F. BRADLEY.

THE story is often repeated in Parisian motor circles of the American manufacturer who decided to introduce his steam automobiles into Europe. He broke ground at Paris, opened a store, advertised largely and was preparing to do a big business, when one day an officer stepped in and asked for the *certificat de conformité* for the demonstrating cars standing outside.

A look of bewilderment passed over the manager's face, followed by an expression of surprise when he learned that every machine before being sold in France must be approved by a government department known as the *Service des Mines*. Application was made for the necessary certificate; the machine, when examined by government experts, was not considered safe; modifications were ordered; they were costly and unsuited to the type; finally, in disgust, and with the loss of a few thousand dollars, the manufacturer abandoned the whole business.

What he should have done before attempting to place a machine on the market was to have obtained a *certificat de conformité*, or government approval of the model. It is a regulation to which all have to submit, both French and foreign makers, and applies not only to the first machine turned out of the factory, but to every subsequent new model.

## All New Models Must Receive Government Approval.

Suppose, for instance, that an established constructor has produced a new six-cylinder chassis. He must apply to the *Service des Mines* a complete description of the model, giving power of the engine, speed at which it is run, dimensions of all working parts, a description of the clutch and type of transmission, stating the size of gears for each speed, show in detail how the braking systems are applied, give details of the carbureter, ignition and the size and nature of the exhaust.

When the sketches and descriptions have been approved—which they nearly always are—the machine itself must be presented for examination. Instructions given to the engineer of the *Service des Mines* are that the tanks, piping, etc., to contain explosive or inflammable matter shall be perfectly safe; that the machine shall not be of a nature to frighten horses or cause unnecessary smell; that all controlling organs shall be so grouped that they allow the car to be operated without drawing the driver's attention off the road; that steering gear must be safe and of a nature to allow the machine to turn within a reasonable angle. This is a matter that receives close attention, a machine faulty in this respect being rigorously refused. If the automobile exceeds 770 pounds in weight it must have a reverse gear. There must be two distinct braking systems, each one capable of stopping and holding the machine, and one of them being on the road wheels or drums forming part of the road wheels. This, too, is one of the matters given special attention. Legally no automobile may travel at more than 30 kilometers an hour in France; yet it is one of the happy inconsistencies of the French system that while one paragraph cuts down speed to 30 kilometers, another makes special provision for machines capable of traveling at a faster rate than a modest 18 1-2 miles an hour. There is a regulation which declares that any speed above thirty must be put out of use by means of a bolt fixed on the change speed sector; but this is always ignored.

A *procès verbal* is supplied to the constructor when his model is approved, this document giving him the right to construct any number of vehicles similar to the one officially approved. A copy of the *procès-verbal* must be furnished to each purchaser of a car, the constructor declaring that it is an exact duplicate of the model therein described, and the paper is accepted by the authorities as a guarantee that the machine is safe for service. Thus one detailed examination suffices for any number of machines of a type having received governmental approval.

Compared with the free American system by which any man who thinks he knows how can build an automobile and place it on the highways, the French method seems very officious. In general,

however, the regulations have a healthy tendency, for they exclude from public roads machines which are likely to be dangerous, and always keep off the market the products of men who would sacrifice all elements of safety in a desire to "get rich quick." As an example, firms we have been acquainted with have had a desire to suppress one braking system, believing that there was sufficient safety in a single set, and have reduced the strength of the rear axle, on a cheese-paring policy, to danger limits, only to be stopped by the *Service des Mines*. If enforced literally they would, like most regulations, be harsh; but there is a desire to help, not hinder, automobilists in France, and though regulations may be out of date, the application of them is generally of a very satisfactory nature.

## Regulations for Owners and Operators.

A private automobilist, a newcomer to the game, is concerned with two regulations. He must register his machine, and he must obtain a driving license, both of which documents are accepted in the whole of France and the neighboring colony of Algeria. To

DRIVING LICENSE DELIVERED AFTER OFFICIAL EXAMINATION.

register the machine he must be armed with a copy of the *procès-verbal* supplied by the manufacturer, which declares that the automobile is a type which can be put into circulation. A registration number being allotted, and attached to the front and rear of the car, all that remains to be done for the machine is to pay the annual tax, based partly on horsepower, and varying somewhat according to locality. In Paris, a 30-horsepower machine would pay \$48 per annum, \$18 of which would be a fixed tax, and \$30 a tax on horsepower. It will be readily understood how strong is the temptation to underrate the power of a car. A gray card (*carte grise*) is the official receipt of the registration of the automobile, and must always be carried by the driver of the machine. It does not indicate that the tax has been paid, that matter being left entirely with the revenue officers, and in no way concerning the police or the gendarmes.

His machine *en règle*, the driver must obtain an operating license. Beyond the stamped paper on which the application must be made there is no expense in connection with a driving permit. The request is sent to the Prefect of the department in which the automobilist is living, or to the Prefect of Police in Paris, and must be accompanied by three small unmounted photographs. From the police department the application is transmitted to the district engineer of the *Service des Mines*, who calls upon the applicant to present himself with the machine he wishes to drive. The standard of efficiency required depends entirely on the inspector; sometimes a twenty-mile run is taken with frequent stops and restarting, changes of gear, reverse driving, and difficult traffic work, followed by a series of questions on the construction of the machine. At other times the inspector is satisfied if

the car is successfully negotiated round one busy block. If a license is required for every make of machine, the applicant must go through a practical test with at least three well-known makes and must submit to a close verbal examination. Immediately it is over the inspector writes out a temporary driving license declaring what make of machine the holder is entitled to drive, gasoline or steam, its horsepower, or giving permission for all systems, without limit of power.

#### A Rigorous System of Identification.

A few days later the temporary license is replaced by the official red card, issued by the police authorities, bearing on one side the name, address, age and birthplace of the holder, and on the other a photograph of the chauffeur. The two duplicate photographs are filed at police headquarters. So long as he retains his driving license (*carte rose*) and his registration card (*carte grise*) in his possession the chauffeur is certain of reasonable treatment by the police. Woe betide him, however, if at any time he is captured without these documents, or with cards not perfectly in order. Two condemnations in one year for inconsiderate driving would cause the card to be withdrawn and would put an end to the holder's career as a chauffeur.

The most valuable feature of the French system is the absolute identification which it affords. The first words of a *gendarme* or *sergent de ville* who has held you up for speeding or other offenses, are, "*Les papiers.*" In an instant the numbers on the gray card are compared with those hung on the front and rear of the automobile, and the photograph on the red card is compared with the features of the driver. All being in order, the officer makes a note of your name, address, and registration number and, unless the charge is a criminal one, leaves you free to continue your journey. Later you will be called upon to answer the charge in the courts, but you will never be hauled by the ears to the nearest police station and made to pay according to the fancy of a country judge with autophobile tendencies.

Thanks to this thorough system of identification, the way is paved for the abolition of arbitrary speed limits and the substitution of individual responsibility for accidents, a system which automobilists all over the world are endeavoring to obtain. Practically that is what it now amounts to in France. You cannot do what you like, as some foreign visitors seem to imagine, and if you drive recklessly Lepine's subordinates will act as harshly as any American constable armed with an unreliable stop-watch. There is an all-important difference, however, between the two systems. Lepine has said to his cyclist police: "Be guided by conditions and circumstances; ten miles an hour, though legal, would be dangerous under certain conditions; thirty miles an hour under favorable conditions would be reasonable." You may be stopped in Paris, at the end of a long, dirty ride and invited to clean the dust off your rear number; you will certainly be stopped if your exhaust is unnecessarily smoky; you must strictly adhere to the rules of the road, and must not drive recklessly in crowded thoroughfares; but on the open highway, where speed is safe, no one will interfere with you if you go "all out."

#### TO DISCUSS CHAUFFEUR EXAMINATIONS.

Many an observant person has been struck with the unsatisfactory nature of the automobile law in this country, by which any person, no matter how inefficient or physically unfit, can obtain a license to operate a powerful automobile. Grandmotherly legislation is not desired, but most automobilists would favor a system of examination for would-be chauffeurs, graduated according to the power of the machine that the applicant wished to drive. Many a man who is capable of handling a small runabout is altogether unfitted by training and temperament to handle a fast, powerful car, yet the law allows any person to take out a machine of unlimited power without any guarantee that he is a fit person to handle such a vehicle. With a rigid examination and a thorough system of registration and identification, automobilists could more strongly appeal for the abolition of many

of the petty annoyances to which they are now subjected by the police. Examination and registration would give official status.

Speaking on this subject to THE AUTOMOBILE representative recently, R. B. Whitman, head of the New York School of Automobile Engineers, said that he had assurance that the question of a compulsory examination for automobile drivers would be brought before the Legislature at Albany next session by two strong political organizations and vigorously pushed forward. "As the law stands at present," said Mr. Whitman, "our pupils, often ignorant of the very elements of automobiling, first get their operating license, then learn to handle a machine. A training and examination ground should be established in the suburbs of New York, where newcomers could learn to drive without any danger to the public, and where State examinations could be held. An examination would have a most beneficial influence in raising the standard of operators, reducing the number of incompetents, and would give the public a distinct assurance of safety that cannot be had under present conditions."

#### STEEL PAVED ROAD EXPERIMENTS IN FRANCE.

PARIS, May 21.—As an experiment, a portion of the roadway in the Rue Saint-Martin, Paris, has been paved with steel, according to a system invented by M. Chaumeret. The paving consists of a perforated steel plate, on each surface of which are a number of parallel vertical steel rails. As for wood paving, a cement bed is formed, on which is laid the steel plate. Space between the rails on both upper and lower surfaces is filled in by cement, that on the under surface serving to hold the plate to the roadbed and the cement on the upper face forming a solid bearing surface. The steel rails are sufficiently close together for a horseshoe or an automobile tire to cover at least three of them.

#### CLUBS DISCUSS INTERNATIONAL RACE RULES.

HOMBURG, GERMANY, June 18.—No decisions have been arrived at by the international conference of recognized automobile clubs held here immediately after the German Emperor's race. France proposed that uniform race conditions should be 2,420 pounds minimum weight, with a maximum fuel capacity of 4.4 gallons per 62.1 miles. Italy favored entire liberty in racing conditions, and England asked for 2,640 pounds minimum weight with cylinder bore limited to 130 millimeters. Unable to come to a decision, it was decided to bring the matter up again at a future conference at Ostend in July. A special commission was formed to study the question of uniform automobile laws, especially with regard to penal responsibility. Germany, France, England, Belgium, Italy and Austria were represented at the conference. In addition two delegates were sent by the French government.

#### THE NATIONAL HYMN.

By DWIGHT W. JONES.

My auto, 'tis of thee,  
Engine of delivery—  
Of thee I sing!  
Car for which I have sighed  
Car that its makers pride  
Let all that wish to ride,  
Full oil cans bring.

My touring auto thee—  
Car of rapidity—  
Thy name I love.  
I love thy repair bills,  
My frequent fines and "spills"  
Result of "pace that kills"  
I do, by Jove.

Let chauffeurs levers seize,  
And we then take our ease,  
In tonneaus strong.  
Let smells fill up our wake,  
Let all that breathe partake,  
And then their silence break,  
With curses long.

**WEALTH OF NATIONAL AUTO CLUBS.**

Over 1,000,000 francs, to be exact and to employ more familiar American terms \$247,992, constituted the income of the Automobile Club of France for the year 1906. It is the largest amount handled by any automobile organization in the world, in addition to being the greatest sum per member. The Automobile Club of Great Britain, which, with its membership of 3,097, is numerically the most important of all national clubs, barely reaches an income of \$110,000. Compared with the two European clubs, the membership of the Automobile Club of America appears small, its number of adherents last year not exceeding 1,450, but its total income for the same period ran up to \$83,768. Comparatively the income per head of the three most important national automobile clubs for the financial year 1906 is: Automobile Club of France, \$102.70 per member; Royal Automobile Club of Great Britain, \$35.50; Automobile Club of America, \$57.78.

It is of interest to note from what sources the powerful French club obtains its huge income, and in what manner it spends its funds. It is not generally understood by the motoring public that the Automobile Club of France consists of two distinct associations, the Société d'Encouragement—a body concerned in the development of the automobile industry—and the Cercle, a merely social club. Practically the two form one, for it is impossible to be a member of the Cercle without at the same time forming one of the Société d'Encouragement. Contrary to what pertains in this country, the French club has a monopoly of all automobile events. The annual show is under its care, the Grand Prix is its especial work, and every important national event is either under its direct control or its patronage.

Subscriptions form the largest source of the club's wealth, the total amount obtained from members under this head being \$104,060. The social side of the A. C. F. contributes much to its financial strength, \$80,340 going into the cashier's hands last year from taxes on betting in the clubrooms. It is this phase of the life of the organization which from time to time calls forth a protest from more sober-minded individuals, who would fain see the organization expel the gambler and devote its whole efforts to the strengthening of the national industry. Others put forth the specious argument that it is better to take \$5 from a gambler, whom nobody obliges to gamble, than to tax a window that you are forced to have if you do not wish to die of suffocation. Forty thousand two hundred dollars were in hand at the beginning of the year. The last annual automobile Salon produced a profit of \$10,000, and a rather larger sum came in from various sources. Last year's income was:

Members' subscriptions .....	\$104,960
Percentage on bets and various.....	80,340
In hand .....	40,200
Annual Automobile Salon.....	10,000
Various .....	12,492
<b>Total Income .....</b>	<b>\$247,992</b>

Deducting the amount in hand at the beginning of the year, the club had the respectable sum of almost \$208,000 to spend during its last financial year. Expenses of upkeep of the former royal palace on the Place de la Concorde are high, \$64,800 being paid out for the building and \$64,400 for internal expenses during the past twelve months. The club is now rich, but there was a time when it was poor, as is shown by \$20,400 for old debts and indemnities to relatives and injured persons in the Paris-Madrid race. The library and various commissions charged with touring, racing, technical and other matters, spent among them \$10,200. Last year's Grand Prix was an unprofitable venture, as is shown by a dead loss in the treasurer's books of exactly \$11,000. The government took \$8,800 of the club's money in taxes; occasional receptions and soirées ran off with an even \$4,000, and the art gallery and annual art exhibition cost \$2,600. Add to this \$12,560 for various expenses and a total expenditure for the year of \$198,860 is reached. Even with such a big expense sheet there is a substantial balance on the right side, the year's operations having brought up the amount of cash in hand to \$49,132.

**THE AUTOMOBILE CALENDAR.  
AMERICAN.**

**Shows and Meetings.**

- Oct. 31-Nov. 7.—New York City, Madison Square Garden, Eighth Annual Automobile Show. Association of Licensed Automobile Manufacturers.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.

**Races, Hill-Climbs, etc.**

- July 4.....—Reading, Pa., Shillington Track, Race Meet of Berkshire Automobile Racing Association.
- July 4.....—Lowell, Mass., Straightaway Road Races, on Lowell-Kingston Boulevard.
- July 4.....—Harrisburg, Pa., Peter's Mountain Hill Climb, Motor Club of Harrisburg.
- July 4.....—Houston, Texas, Race Meet, Houston Automobile Club.
- July 6.....—Boston to Keene, N. H., and Return, Endurance Run of the Bay State Automobile Association.
- July 10.....—Cleveland, O., Start of Fourth Annual Tour of the American Automobile Association, for the Gildden Trophy. Finishes in New York City on or about July 23.
- July 13.....—Rochester, N. Y., Gymkhana Sports, Genesee Valley Park, Rochester Automobile Club.
- July 13.....—Chicago, Race Meet for the Entertainment of the Gildden Tourists, Chicago Automobile Club.
- July 25-28.....—Providence, R. I., Annual Meet of the Federation of American Motorcyclists.
- July 27.....—Schooley Mountain Hill Climb, near German Valley, N. J. W. J. Morgan, manager, Bretton Hall, New York City.
- Aug. 1.....—Algonquin, Ill., Hill Climb, Chicago Motor Club and Chicago Automobile Trade Association.
- Aug. 5-10.....—Atlantic City, N. J., Automobile Carnival, Atlantic City Automobile Club.
- Aug. 9-10.....—New York City, Brighton Beach Track, 24-hour Automobile Race, United States Motor Racing Association.
- Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Oct. 19.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize. Aero Club of America.

**Motor Boat Races.**

- July 20.....—New York to Marblehead, Mass., 270-mile Motor Boat Race. New Rochelle Yacht Club.
- Aug. 13-15.....—Chippewa Bay, St. Lawrence River, Gold Challenge Cup Race; American Power Boat Ass'n.
- Aug. 22.....—New York to Jamestown (Va.), Annual Cruise American Power Boat Association.
- Sept. 2-6.....—Jamestown (Va.) Exposition, Motor Boat Races.

**FOREIGN.**

**Shows.**

- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.....—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.

**Races, Hill-Climbs, etc.**

- July 14, 1908.....—Paris to London, Aerial Race.
- July 15-18.....—Ostend Week, Record Trials, Automobile Club of Belgium.
- July 25.....—Ardennes Circuit, Belgium (German rules).
- July 26.....—Ardennes Circuit, Belgium (Tourists).
- July 27.....—Ardennes Circuit, Belgium (Grand Prix rules).
- July 31-Aug. 8.....—Belgium Regularity Contest for Touring Cars, A. C. of Belgium.
- Aug. 1-7.....—Criterium of France, 1,750 Miles Touring Competition and 250-mile Race for the Press Cup, A. C. of France.
- Aug. 11-29.....—France, Coupe de Auvergne.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.

**The Glidden Tour in Its Aspect as a Test of Endurance.** Added interest is lent to the holding of this year's A. A. A. Tour, which is to start from Cleveland for New York, via Chicago and Pittsburg, on Wednesday next, due to the totally unexpected outcome of the Sealed Bonnet contest, run off so successfully by the Automobile Club of America a fortnight ago. It will be remembered that it was seriously suggested that the same rules which characterized the latter contest should also be made to apply to the running of the tour for the Glidden and Hower trophies, but no one except the sponsor of the suggestion itself could see the possibility of holding a prolonged test of endurance under such conditions. It is generally conceded that the A. A. A. tour is the most trying test of the enduring qualities of a car that is held, but the number of successful contestants that marked its close during the past two years show conclusively that the automobile has reached a stage of perfection that is far beyond the standard of the tests designed to try its staying qualities to the utmost and in every way.

No such radical change in the rules under which next week's tour is to be held is possible at this late date, but it is evident that in the future endurance runs and similar tests will be such in name only unless a complete revision of existing standards by which the cars are judged are brought about. The regulations, as laid down for the holding of this year's celebration of America's classic long-distance try-out, have been carefully prepared with a view to preventing the unsatisfactory state of affairs that is inevitable when a large number of the contestants finish with perfect scores, and, in view of the conditions extant at the time they were prepared, there naturally appeared to be no alternative but to adopt some

such arrangement of this kind. With the amendments that have been made since they were first published, they are probably as agreeable to the competitors as any that could be devised; but there appears to be little doubt that another year will see the adoption of far more stringent conditions. As it is, the success of this year's tour already seems assured, and the working of the carefully prepared plans for its regulation will be watched with interest. Any car that can survive the 1,500-mile journey has reason to exploit its reliability and staunchness, and in confidence bid for the patronage of the automobile-buying public.

**Great Future of the Original American Automobile.** It is extremely interesting to note what a complete reversion to the type of self-propelled vehicles, originally brought out in this country, has taken place within the past few years. Pioneer builders found so very little material available to their needs that it was only natural that existing forms should have been impressed, and a horseless carriage that was true to its name should have been the result. Its shortcomings were painfully apparent, even to its own builders, despite which they clung to it tenaciously. Foreign designers pointed the way to progress, and it was not until the buggy was abandoned that a real advance was brought about, and that along totally new lines.

One, or possibly two, American makers still cling to it, but for all practical purposes its existence had been ended as completely as was that of the high bicycle with it was superseded by the low two-wheeler. Unfortunately, the automobile, as we know it today, does not lend itself to production at a figure within the reach of a very large part of the population; and, even though obtainable at a greatly reduced initial cost, its maintenance is a tax of too burdensome a nature for the many. This led to the revival of what one maker has aptly termed the "buggy-about" a few years ago, and this light, easily handled and cheaply kept vehicle bids fair to become a tremendous factor in the American automobile industry. With its small power plant, few parts and easily understood mechanism, it is simplicity itself, and that it is capable of covering long distances at a minimum cost is evident from the recent performance of one of these high-wheeled horseless carriages, which covered 200 miles, under most adverse conditions of road and weather, on eight gallons of gasoline and three pints of lubricating oil. The agricultural population is in pressing need of a quicker and better means of transportation, and there is little doubt that this American type of automobile represents the solution that will be availed of in thousands of instances.

**Present Status of the Electric Automobile.** Just because it is not as constantly in the public eye as its confrere, the gasoline car, many are prone to regard the electric automobile as a dead letter, confined, more or less, to a comparatively small number of cabs in the larger cities—and many of them out of date at that—a slightly less number of heavy trucks and a sprinkling of pleasure vehicles. Nothing could possibly be further from the reality as represented by existing conditions today. It would be idle to assert that the electric can ever hope to compete with the gasoline-driven car on its own ground, for obvious reasons, and it is usually the man who seriously considered the former as a serious competitor in earlier days who now regards it as having passed away altogether.

In its own particular sphere of usefulness there is nothing superior to the electric automobile, and that its radius is necessarily limited by the mileage obtainable from a single charge of the battery has not militated against it in the least for town service. If there were no other evidence forthcoming to show its popularity, the fact that an agent in an upstate city can order a trainload of electrics at a time should be conclusive. A report of the number of electric cars annually sold in this country and the constant use to which they are put would be little short of eye-opening.

## THAT CHICAGO SHOW SITUATION.

Drawing for spaces at the next Chicago show was held at the headquarters of the National Association of Automobile Manufacturers, 7 East Forty-second street, on Monday, and was participated in by those members who are also members of the American Motor Car Manufacturers' Association. Prior to the actual drawing, however, a special committee composed of Benjamin Briscoe, Maxwell-Briscoe Motor Company; William Mitchell Lewis, Mitchell Motor Car Company, and Alfred Reeves, general manager of the Association, waited upon the Executive Committee of the National Association. The delegation from the independent camp, the first two of whom are also members of the National Association's committee, presented a formal petition asking that A. M. C. M. A. members be placed on the same basis as all others in the drawing. It was also proposed that members of the American Association should receive a pro rata share of the profits of the show, the total to be donated to the cause of furthering the good roads movement.

The suggestions from the delegation were embodied in the following terms, as sent out by the publicity department of the A. M. C. M. A.:

All recognized automobile manufacturers who support association work are entitled to consideration, proportionate to their outlay, in the distribution of any profits which they all create.

The fact that some manufacturers who have demonstrated their faith in organization by joining some other body are not members of the N. A. A. M. is due to the disinclination of the Executive Committee to admit them, and not to a disinclination to become members or lack of effort to secure membership.

Should these facts be allowed to operate against them for the advantage of other but more favored manufacturers?

In other words, should the N. A. A. M., Inc., receive not only the entire profits attributable to the exhibits of its own members, but also of the outside exhibitors who are denied the privilege of membership?

If not, and the premises are correct, the outside supporters of association work should be allowed such share of the profits as their payments for space bear to the whole amount paid for automobile space.

Hence it is suggested that the N. A. A. M. rebate that proportion of the profits of the Chicago show which the payments made by A. M. C. M. A. members who are not members of the N. A. A. M. bear to the whole amount paid for automobile space; the sum total to be donated to the good roads movement now forming.

In line with the above, it is felt that the members of the A. M. C. M. A. and the members of the N. A. A. M. should all stand on the same basis in the matter of drawing for space. It is felt that this would be fair and equitable, especially as it could not, under any circumstances, disturb the positions of the N. A. A. M. members who have shown in big spaces for any great length of time.

The Executive Committee of the National Association refused to agree to any of the proposals of the above resolution and the drawing took place as originally arranged for. Members of the independent association drew for their spaces as usual, which means that after the members of the N. A. A. M.—the promoting organization—had had precedence in the drawing, outside makers were allowed to take their chances on the remaining spaces. As until July 15 is allowed to ratify the drawing by making the first payment for the spaces, the outcome is still in the balance.

In the meantime the A. M. C. M. A. will hold a special meeting to consider the matter. The questions to be decided will be whether they will exhibit at Chicago or not, and whether to hold an independent show in conjunction with the Chicago Automobile Club, with a third and more or less formal question that is really part of the first in case this should be decided in the negative. This is, whether New York is not really the natural show place of the country and one show here is sufficient for all purposes.

It is expected that either Chicago will be dropped entirely or an independent show will be held in conjunction with the Chicago Automobile Club, it being understood that options have been obtained on two available buildings.

From N. A. A. M. headquarters came word that it had no announcement to make in reference to the matter, and that the action of its committee spoke for itself at this time.

## JERSEY MAY GET VANDERBILT RACE.

There is a strong possibility that the Vanderbilt Cup race may be run on a New Jersey circuit this fall, the conference of A. R. Pardington, acting chairman of the Cup Committee, and Wilbur F. Sadler, Jr., president of the Associated Automobile Clubs of New Jersey, at Trenton on Monday last with Governor Stokes having borne fruit. The Governor was at first opposed to the holding of the race, but he saw a great light when informed that last year's event left \$600,000 in Nassau County. On the assurance of Mr. Pardington that all expenses incident to the race, repairing road damages, employing police and the like, would be paid by the Cup Commission, the Governor agreed to send a special measure to the legislature, urging the passage of an act legalizing the closing of county roads, provided the proper bill were ready for introduction; he was also agreeable to calling out the militia for the purpose of policing the course. Thirty-mile circuits over good roads are available in Mercer, Union, Essex, and Monmouth counties, the rivalry to obtain the race being greatest between Mercer and Monmouth, the board of trade of the former making strenuous efforts to land the prize.

The dates set are October 12 for the elimination and October 19 for the race proper, and up to last Saturday there was still some hope that the event might be held on Long Island as usual. On that day, a delegation composed of A. R. Pardington, President Oliver A. Quayle, of the New York State Automobile Association, and Sheriff Gildersleeve, of Nassau County, accompanied by his counsel, presented a petition to Governor Hughes at Albany with a view to having a regiment of militia detailed to patrol the course. But neither the fact that the Federal government patrolled water courses for boat races, the financial inducements involved, nor that New Jersey was willing to grant the request for troops, were sufficient to make the Governor take the petitioners' view of the question, the chief executive placing his refusal on the ground that such duty would tend to reduce the morale and efficiency of the National Guard, so that all chance of New York having the race has practically vanished.

## N. Y. STATE ASS'N OF A. A. A. GROWING.

Four clubs were added to the roster of the New York State Association of the A. A. A. at the meeting of the board of directors held in New York City, June 29, at 437 Fifth avenue, the A. A. A. national offices. President Oliver A. Quayle presided, and Secretary C. D. Hakes and Directors S. M. Butler, C. M. Lowther, A. C. A.; A. H. Knoll, A. C. of Buffalo, and the National Secretary, F. H. Elliott, were present. The Long Island Automobile Club, Adirondack Automobile Club of Sandy Hill, Automobile Club of Schenectady, and Cohoes Automobile Club were elected to membership. N. M. Pierce resigned as director of the Binghamton Automobile Club and Guy Beardsley was designated. Mr. Pierce's removal to Buffalo accounts for his resignation, but he will retain the treasurership. N. Z. Yelverton was named as the Schenectady club director.

In his report President Quayle said: "The policy of this Association for the four years last past has been that of opposing legislation of any kind or character. The time has now arrived when it will be necessary for us to assume the more aggressive attitude of suggesting provisions of a new law, and I am personally hopeful that this Association will at the next session of the Legislature urge for passage a law which will provide for a more thorough means of identification; the absolute abolishing of all technicalities as to speed regulations, requiring simply that the automobile shall proceed at all times at a rate of speed which shall be reasonable and proper, due regard being given to the rights of all other users of the highway, whether it be in the open country or in the thickly settled portions of the city; that an annual registration fee be imposed and that all such money so derived, together with all money collected from fines, be appropriated and put into a fund to be used exclusively for the maintenance of the improved highways of this State."

LOOKING DOWN TRINITY BOULEVARD, ATLANTA, ORPHANS' DAY.

### GEORGIA'S CAPITAL CITY HOLDS ORPHANS' DAY.

ATLANTA, GA., July 1.—Reports of the most successful celebrations of Orphans' Day that the country has seen still continue to keep coming in, owing to the fact that many cities found it inconvenient to observe the day formally set for the purpose and celebrated when it suited them best. This was the case of Atlanta, Ga., and the hospitable southerners did the thing up fine. In fact, Atlanta had more cars—big cars at that—and fewer orphans than any city that has yet placed itself on record as having given the orphans a bang-up time of it. There were 85 touring cars and only 335 orphans, and THE AUTOMOBILE'S correspondent figured out that this band, the aggregate capital of which would not total 30 cents, took entire possession of automobiles valued at \$300,000 and made free with Ponce De Leon Springs, representing an investment of an additional \$200,000. There was a contingent from all the orphan asylums of the city, and the committee in charge composed of Robert F. Shelden, Edward H. Inman and Charles H. Ryan, who were assisted by a number of other enthusiastic autoists.

### ST. LOUIS CLUB HOLDS SUCCESSFUL DAY.

St. Louis, Mo., June 28.—Probably few of the automobile clubs in other cities of the country made such a success of the Orphans' Day celebration as did the local club. June 19 was the date set, and the appeal for cars met with a generous response, some sixty odd cars being in line, while the arrangements for the entertainment of the city's waifs were perfect and every thing went smoothly. Even though the occasion was a special one, on which the most hard-hearted of upholders of the law could be expected to close an eye on a little speeding, all the drivers, who were in numerous instances the owners themselves, observed the law strictly, much to the disappointment of the children, who would have preferred to go a little faster. It was estimated that something like 2,000 children were entertained, those from the northern and western parts of the city being taken out Clayton road to Forest Park and the others being driven to Tower Grove Park, so that there really were two independent celebrations, each of which was an unqualified success that will long be remembered.

ORPHANS' DAY ON THE PACIFIC COAST, AT SEATTLE.

### BUFFALONIANS GIVE ORPHANS AN OUTING.

BUFFALO, N. Y., July 1.—Twelve hundred orphans in Buffalo institutions were made exceedingly happy last Friday by the members of the Automobile Club of Buffalo and the management of Luna Park, a local summer resort. It was Orphans' Day in the annals of the Automobile Club. After energetic work Secretary D. H. Lewis managed to get 200 Buffalonians and business houses to donate the use of their private cars.

The parade started from the rooms of the Automobile Club at Main and Edward streets about 2:30 o'clock in the afternoon. The parade had a few accidents, such as slight collisions and burst tires, but no injuries were reported. The machines traversed the principal thoroughfares of the city and then took a drive through the parkways. The parade wound up at Luna Park, where Manager MacDroom saw to it that each little orphan was given a free pass to every concession in the place. They also received ice cream and sandwiches and had their pictures taken several times. The parade was headed by President Seymour P. White and Father Baker's boy band. It was divided into eight divisions in charge of A. B. Wright, Cary Rumsey, John S. McFarland, A. H. Knoll, C. N. Babbitt, Frank Snyder, Charles E. Throop and President White.

BUFFALO ORPHANS ENJOYING SIGHTS AT LUNA PARK.

### ORPHANS' DAY IN THE SMOKY CITY.

PITTSBURG, PA., July 1.—Under the auspices of the Automobile Club of Pittsburg over four hundred happy orphans, each holding in his hand a small American flag, enjoyed the sights of Pittsburg Thursday, June 27. Special arrangements had been made with the weather man, and a more delightful day could not have been found. Eighty-two of the finest automobiles in Pittsburg were used to carry the children.

At Luna Park the children were given full sway, and remained a good part of the afternoon, making use of the amusement devices. This is the third year that the Automobile Club of Pittsburg has thus feasted the orphans, and although the event did not occur on the regular scheduled day, it was by far the most successful they have ever tried. The committee was composed of Edward Kneeland, Paul C. Wolff and Philip S. Flinn.

### ORPHANS' DAY OBSERVED OUT ON THE COAST.

SEATTLE, WASH.—June 24.—Not to be outdone by any of the eastern cities despite their greater size and larger number of automobiles, Seattle went in for an Orphans' Day celebration which, except in point of size and the fact that it was held ten days later than the day set by the A. A. A., was as successful as any that have been held. G. W. Miller, manager of the local Winton branch, was in charge and took fifty-one children from the Orphans' Home for an afternoon of enjoyment.

# ENERGETIC HAPPENINGS AMONG THE CLUB

## Chicago Club's New Home Is Formally Opened.

CHICAGO, July 1.—It was at first intended to put part of the magnificent new home of the Chicago Automobile Club on Plymouth place in commission last week, but it was finally decided to await the completion of every department, so that the club's new quarters could be opened all at once, and this was done officially to-night, the ornamentation of the grillroom and some of the furniture for other parts of the building, which were the only things missing last Thursday, having been installed.

With the exception of some space reserved along the Plymouth Court frontage for two stories, almost the entire main floor is given over to the garage. For the living quarters the members must either descend to the rathskeller or go to the second floor.

The garage is entered from the street by a passageway which opens upon the entrance for the disembarkation of passengers. The entire garage structure is separated by a brick fire wall, unbroken except by a single iron door on each floor, from the rest of the building. The main part of the structure rises three stories above the garage, in order that better lighting from the east may be secured in the sleeping apartments.

Extending across the entire width of the second story is the lounging room, a colonial hall in gray wood and soft green decorations. Corresponding in location to the lounging room, but one story higher up, is the café, an old English eating hall with Dutch olive beams of massive dimensions, wall decorations of dark red and gray, and carpet and velvet window hangings to match. The companion eating hall is located in the basement, where a combination billiard room and grill has been devised.

The club is making elaborate plans for the reception of the Glidden tourists on their stop over here on July 12 and 13, a formal welcome at the Auditorium being the first event on the program, the club's new house being thrown open to the visitors during their stay. There will be a theater party on the evening of the day of arrival, with a run to Ravinia the next day.

## How the Ontario League Discourages Recklessness.

TORONTO, ONT., July 1.—The Ontario Motor League has been active of late in discouraging reckless driving. It will be remembered that it was embodied in the constitution adopted at the recent organization meeting that one of the objects of the league should be to secure the proper observance of the law.

There have been the usual number of complaints about alleged misdoings of autoists from the public. The Motor League has taken steps to investigate a number of these, with the result that it has brought some of its membership on the carpet. In many cases, however, the trouble has come from chauffeurs who are irresponsible. It is somewhat difficult to discipline them, but the Motor League has been successful by personal interviews and threats and even by assisting in the prosecution.

## Canadians Want Reciprocity.

MONTREAL, QUE., July 1.—The Automobile Club of Canada is in communication with the American Automobile Association, Royal Automobile Club of Great Britain and the Automobile Club of France for a reciprocal arrangement whereby their members, while touring in foreign countries, could have granted them the privilege of these clubs. This will undoubtedly result in the simplifying of the customs regulation governing the use of cars of tourists who wish to cross the border from either country, as well as providing of mutual benefits in various other ways.

## Maryland Club Postpones Rowe Trophy Tour.

BALTIMORE, MD., July 1.—The first tour for the Rowe trophy has been called off until some time in September. These tours were to have been started this month, but the entry lists could not be filled out to the satisfaction of the promoters because of the fact that most of the members of the Automobile Club of Maryland, who were the only ones eligible to participate in the contests, will be out of the city during July and August.

CHICAGO AUTOMOBILE CLUB'S NEW HOME.

A CORNER OF THE CARD ROOM.

THE AMPLE COLONIAL LOUNGING ROOM.

BACHELOR SUITE ON UPPER FLOOR.

Dr. Rowe has also decided to hold but one tour each year instead of three as originally intended. This tour will be at a distance of 400 miles, the route of which, however, has not yet been decided upon. It was at first intended to hold a series of three tours each year at distances of 100 miles, 200 miles and 400 miles, but all except the last has been abandoned.

#### Washington Club's Tour to Gettysburg.

WASHINGTON, D., C., July 1.—The Automobile Club of Washington this season is putting forth every effort to awaken interest in touring. C. Royce Hough, the newly elected captain, and his able lieutenant, T. B. Spence, are veterans at touring.

Probably the best trip the club has yet taken was that to the Gettysburg battlefield, June 22 and 23. The weather god was in a genial mood and the roads were in magnificent shape. The route was the familiar one out the Brightwood road to Olney, and thence to Ridgeville, where the National pike was taken into Frederick. From Frederick the Emmitsburg pike, one of the finest and best kept roads in this section of the country, was taken to Emmitsburg, while from the latter point to the edge

ON THE SUMMIT OF BIG ROUND TOP, GETTYSBURG.

of the battlefield the route was over a common dirt road, marked by deep gullies all the way. This bit of road is the only bad one to be found between here and Gettysburg, and leading as it does into the battlefield and being traversed by thousands of automobiles and other vehicular traffic, the wonder of it is that the Maryland authorities do not make some effort to put it into passable shape. The Glidden tourists will probably find this road the meanest in their long tour.

Maryland roads are infested with innumerable dogs and chickens, and in order not to offend the farmers, who are favorably disposed to automobilists, the tourists before starting were cautioned not to ruthlessly run over the pests. Several drivers had narrow escapes from running over dogs that persisted in lying in the middle of the road, while more than one car was brought to a standstill by an obstinate cow that refused the right of way and would not budge.

The most pleasing part of the trip was the ride between Frederick and Emmitsburg, a distance of about twenty-three miles. The pike is operated by several private companies which collect toll, and they never let the road get rutty. The pike runs through Frederick county, said to be the third richest agricultural county in the United States, and the well-tilled farm lands are a delight to the eye. A few miles out of Frederick is the old Schley homestead, where Rear Admiral Schley was born. It is just off the roadside, and its shaded driveway is one of its attractive features.

Entering Emmitsburg the tourists paused for a while and were soon surrounded by many inhabitants of the quaint little town. The town gains distinction from the fact that it was here that General Reynolds, commanding the first corps of the Army

of the Potomac, got his troops in shape for the march into Gettysburg. His troops marched over the road heretofore mentioned and the tourists as they bumped over the ruts and stones could not help but express pity for the soldiers compelled to march over such a road in the hot sun. In due time the edge of the battlefield was reached and then a quick spin over Confederate avenue soon brought them into Gettysburg. Headquarters were established at the Gettysburg Hotel.

After a good night's rest the tourists started early Sunday morning to inspect the battlefield. Under the guidance of Mr. Hoffman, who was born and raised in Gettysburg and who participated in the great three-day struggle, the tourists took in every part of the battlefield from Big Round Top to Little Round Top. Three hours were thus spent, and then after an old-fashioned country dinner the cars were started homeward.

#### Schenectady Club Organizes with 34 Charter Members.

SCHENECTADY, N. Y., July 1.—There is now a Schenectady Automobile Club to swell the large number of organizations that New York State boasts of. Oliver A. Quayle, president of the New York State Automobile Association, and C. D. Hakes, secretary of the Albany Automobile Club, made addresses on the purposes of automobile clubs and the good they are doing, at a meeting held here last week. The meeting was presided over by C. H. Benedict as chairman, who was later elected president of the newly formed club, with Gerardus H. Smith as vice-president, A. F. Knight, secretary, and J. W. Yelverton, treasurer. Good roads, national legislation and the suppression of lawlessness in the use of automobiles will be the chief aims of the club. The annual dues are to be \$5, with no initiation fee.

#### Successful End of Albany Club's Annual Run.

ALBANY, N. Y., July 1.—Fourteen of the sixteen cars that participated in the annual run of the Albany Automobile Club survived the 700-mile trip to Atlantic City and returned, according to schedule, on Wednesday last, several of them with perfectly clean scores, prominent among these winners being Miss Edith Franklin, who drove her Franklin throughout the tour. President McClure, who offered a cup to the contestant to finish with the best score, met with difficulties himself just outside of Trenton on the return trip and had to give up. The other contestant to be eliminated was A. C. Thorpe, who dropped out at Atlantic City. Just above Poughkeepsie, on the return trip, several of the party fell into a trap and were compelled to shell out for the support of the town and, incidentally, of the constables.

#### Sacramento Soon to Have an Automobile Club.

SACRAMENTO, CAL., June 26.—A large number of local automobilists met at the Chamber of Commerce in this city recently to discuss plans for the organization of an automobile club, which will affiliate with the Sacramento Country Club and erect a suitable clubhouse here. The latter organization has long been in need of larger quarters, and the suggestion that an automobile club be formed to co-operate in providing a modern and commodious clubhouse met with instant approval. R. C. Cash called the meeting to order and was elected chairman, with M. R. Upson as secretary. A site of 110 acres, adjacent to Orangevale Lake, was offered for \$20,000, and it is proposed to sell bonds to the extent of \$40,000. A committee composed of Messrs. Crowell, Hevener, Cash and Dr. Griffith was appointed to take charge.

#### Rain Caused Postponement at Rochester, N. Y.

ROCHESTER, N. Y., July 1.—Because of a drizzling rain which bade fair to develop into a downpour, the gymkhana sports of the Rochester Automobile Club, which were to be held this afternoon in Genesee Valley Park, were postponed until Saturday afternoon, July 13. About two hundred cars were lined up around the course, and several hundred spectators were present only to be turned back home disappointed.

KILOMETER STRAIGHTAWAY, JUDGES' BOX ON RIGHT.

LONDON, June 18.—Nineteen miles from Waterloo station Britain possesses the only race track specially constructed for automobiles to be found in the wide world. Speed restrictions have been so severe in the tight little island and the Britisher has had such scant opportunities of either witnessing or indulging in any rate of travel above the normal, that he is to be excused for his display of excitement when the scene of world's records is brought to his front door.

Nine months ago, on his private estate near Weybridge, Mr. F. Locke King began the construction of a special race track, designed to admit of speeds of 100 miles an hour with perfect safety. By employing large gangs of workmen night and day, the course has been finished in record time. It is pear-shaped, with curved ends, banked to a maximum height of 28 feet, and is 2 3/4 miles round. A straightaway, laid diagonally across the oval, gives an additional length of five-eighths of a mile. Average width is 100 feet. Some idea of the prodigious nature of the undertaking can be gathered from the fact that although the ground was favorable for a course, the total cost is estimated at \$750,000. The entire track is concreted to a depth of five inches, and it is considered that, despite the rapid construction,

the foundation has become sufficiently congealed to cause no future trouble.

Owing to the formation of the land, excellent accommodation is provided for the public, there being seating room for 5,000 people and standing room for 150,000. Within the track,

near the finish of the straightaway, are clubhouses with garage accommodation for a number of cars, and on the opposite side of the straight course the judges' box has been located, in front of which all finishes will be made. From the high ground of the island on which the judges' box is placed an excellent view of the entire course is obtained. Admission to this vantage ground is by means of a bridge spanning the track, or by a tunnel passing under it. Large score boards within the club enclosure opposite keep the public posted on the names of the competitors and their positions in any race. At the fork where the straight kilometer track leaves the main course the width is 250 feet.

A double purpose will be served by the track. It will be used by the Brooklands Automobile Club for public races, the intention being to hold periodical meetings on much the same lines as horse races are held, and it will be a training ground for manufacturers. There is no doubt but that the track will be enormously successful as a public race ground. It is close to London, placed in a picturesque country, will offer more thrilling scenes than any race course, and promises to provide well for the public. Any day when there is no racing, with the exception of Sunday, manufacturers may use the course for testing cars on payment of a fee of five dollars. Members of the club have free use of the track, and it is expected that most manufacturers will apply for membership. Twenty-eight closed garages have been erected, to be rented to constructors in order that they may keep cars permanently on the track ready for demonstrations.

FIRST 24-HOUR RECORD AT BROOKLANDS.

LONDON, June 29.—S. F. Edge has more than fulfilled the promise made a few weeks ago to travel continuously 24 hours at an average of sixty miles an hour, on the Brooklands track. Today, on a six-cylinder Napier, he covered 1,581 3/4 miles in 24 hours, which gives an average of nearly sixty-six miles an hour. The first 100 miles were covered in 85 minutes, and 1,000 miles in 14:54:15. As was expected, Edge has broken all 24-hour track records, for he is the only man who has yet had an opportunity of speeding on this unique automobile course.

BANKING 28 FEET HIGH, FOR 100 MILES AN HOUR.

AN ORDERLY, LEISURELY PROCESSION ON OPENING DAY.

KULICK DRIVING FORD SIX IN THE DETROIT RACE.

### THAT RECENT 24-HOUR AT DETROIT.

DETROIT, July 2.—In winning the recent 24-hour race on the State Fair Grounds track, Frank Kulick did not lower the existing record held by Clemens and Merz with a "30" National and made at Indianapolis, November 16-17, 1905. Its total was 1,094 3-16 miles, and while Kulick and his occasional mate traveled 1,135 miles, the journey was accomplished with two Ford six-cylinder machines, so that the performance, though a most creditable one from every point of view, cannot properly be considered as an officially sanctioned record under the existing rules.

The wreck of the Pope-Toledo in the Detroit race will be handed down in automobile history. Lytle, for six consecutive hours, without leaving his car or touching it with a wrench, broke records for a circular track. At this point a rear tire burst, wrecking the car and throwing out the driver. The duplicate entry driven by Lohse having also met with an unavoidable accident before the race began, Lytle took a Pope-Toledo demonstrator of the same model, that had been driven over 22,000 miles, and continued the race, finishing second by only twenty-six miles, having gained the difference between the thirty-odd miles lost by the delay of accident. The Pope entries were regular stock cars and not Vanderbilt Cup racers, as reported.

### FAST TRACK WORK AT ST. PAUL.

ST. PAUL, MINN., June 29.—Ralph Mongini, driving a Matheon, won the 24-hour automobile race at Hamline track with 1,037 miles to his credit. Zerbies came second with 918 miles, Eddie Bald getting third place with 445 miles. Bald ran up the biggest mileage for one hour, covering fifty-four miles. On the previous day Eddie Bald won the 25-mile championship in 30:28. E. Simpson was second in 31:50, and Winston third in 31:56.

LYTLE IN POPE-TOLEDO TAKING DEADMAN'S CURVE.

### AUTOISTS AVOID PASSING THROUGH POKEEP.

POUGHKEEPSIE, N. Y., July 2.—This city is fast achieving such a notorious reputation due to the pernicious activity of the local authorities in carrying the enforcement of the speed law to an absurd extent, that autoists generally are beginning to avoid the town on the banks of the Hudson, and with good reason. Since the opening of the touring season, trapping has been most active and fines have been imposed on the most flimsy pretexts. One of the familiar type, in which a rope arranged to be stretched across the road in front of an approaching car plays a prominent part, has been established at Hughsonville, about a mile south of Wappinger's Falls, while another one is in full blast about three miles north of the city, and it netted quite a bag of the returning competitors in the Albany Automobile Club's annual run a week or two ago. Not satisfied with working this game to the limit on the main road running north and south along the river, similar traps are also being started on the unimportant country roads leading in from the east, so that there is no avenue of approach to Poughkeepsie on which the autoist may feel safe from persecution.

Some idea of the absurd extent to which the enforcement of the law is being carried in the city itself may be had from the case of John Van Benschöten, who, with three of his drivers, was recently arrested, when showing the Georgetown 'varsity

WRECK OF LYTLE CAR CAUSED BY BURSTING TIRE.

crew about, for having exceeded the legal limit of four miles an hour in rounding a corner. As the law stands there is some ambiguity, and hours have been spent in arguing whether the four-mile limit applies only to a car rounding a curve or not, one claiming that the situation in question is an intersecting highway, and the other that it is a sharp curve.

### THE UBIQUITOUS MOBUS AND ITS MANY USES

LONDON, June 27.—The motor omnibus has found many spheres of usefulness during its short but energetic career, and its latest application is by no means the least promising. Mr. Charles Frohman is responsible for this recent idea, by which patrons who have booked seats for his theater are picked up at their residences by a special motor 'bus and quickly conveyed direct to the scene of their evening's enjoyment, the return at the close of the performance being made in the same convenient way. In the present initial stage of the experiment it is not found possible to serve the same districts on successive nights; accordingly at the time of booking seats information is given when the next 'bus will be in purchaser's neighborhood. If this does not suit the usual roundabout method of doing the journey must be resorted to. The innovation has aroused much attention, and even if the number of visitors conveyed in this way is comparatively small, the astute manager has secured the desired object in another way by booming his theater.

**A NEW AMERICAN HIGH TENSION MAGNETO.**

Under the title of the "Komet" the Dow Portable Electric Company of Braintree, Mass., has recently placed on the market a magneto of the true high-tension type, which, from the excellence of its electrical design and the painstaking care given to its construction, should make it an important factor in the ignition

SECTIONAL ELEVATION OF THE DOW HIGH-TENSION MAGNETO.

field in this country. The matter of employing only the very highest grade of materials throughout has also been given attention, a special class of imported steel being used in the manufacture of the field magnets. No attempt has been put forth to produce a revolutionary design, but the highest recognized standards of electrical and mechanical engineering have been followed in the construction of the machine. Both the primary and the secondary windings are placed on the armature of the generator, one end of the former being connected with the armature core, while the other is connected with a brass clip terminating in a stud. One end of the secondary winding is also grounded on the armature core, while the other is brought out to a revolving ring from which the current is collected by a spring-controlled carbon brush. The primary current is collected in the usual manner by means of

END VIEW HIGH-TENSION TYPE.

DOW LOW-TENSION TYPE.

a platinum tipped contact screw, resting against an interrupter spring which also carries a liberal-sized platinum point.

In this manner the primary winding of the armature remains short-circuited upon itself except at the points represented by the two elevations on the cam or interrupter disc, the space between the points not being more than 1/64 inch, this being regulated by the platinum screw. Thus two of the current waves produced at each revolution of the armature are utilized, the current being conducted through a spring-controlled carbon brush to the distributor. The latter consists of a disc screwed to a pinion driven by another pinion of half the size on the armature shaft, so that the operation of current generation and distribution is

synchronous. The condenser, connected in parallel with the primary circuit in which the interrupter is located, is mounted at the distributor end of the magneto.

A safety spark gap is provided so that should any break occur in one of the high-tension leads the current will bridge this opening in the circuit without damaging any part of the generator. The latter must be run positively from the motor at the same speed as the crankshaft in the case of a four-cylinder motor, and at one and a half times the speed of the crankshaft for a six-cylinder motor. The timing of the spark is effected by causing the interruption of the primary circuit to occur sooner or later, which is readily accomplished by placing the armature at the position of maximum induction to correspond with the upper dead center or earliest point of firing of one of the pistons. To stop the motor, provision is made for short-circuiting the primary winding of the magneto by means of a switch mounted on the dash.

**MORA SEALED BONNET CAR REACHES CHICAGO.**

Not satisfied with having come through the original sealed bonnet contest of the Automobile Club of America with honors, one of the Mora cars, driven by W. H. Birdsall, left New York City on Monday, June 24, for Chicago with its original seals still intact in order to participate in the contest of the same kind held by the Chicago Automobile Club on June 28. In dropping off a bridge west of Utica a spring was broken, which necessitated a slow trip to the factory at Newark, New York, where it was replaced. The car arrived in Chicago on Thursday morning June 27, at 10 o'clock, or with almost twenty-four hours leeway to start in the contest next day, having been driven by Birdsall, John David and J. H. Stickney in turns and having covered a total of more than 1,800 miles without an adjustment since the seals were first placed on it.

**SHOTGUN TACTICS NOT UPHELD IN MICHIGAN.**

LANSING, MICH., July 2.—Harry Kraft, a farmer of this place, has made a habit of carrying a loaded double-barrel shotgun with him since an automobile scared his horses, causing them to run away and ruin the buggy. He recently had an opportunity to make a display of the weapon when Louis Spice, driving a car, did not stop as quickly as he was commanded to do by the irate agriculturist. He aimed the gun at the auto party, and later decided to plead guilty to a technical charge of assault, on which he was let off with a fine of \$15 and \$8.50 costs. At this rate the shotgun will probably be left home in the future.

**CLEAN SCORES NUMEROUS AT MILWAUKEE.**

MILWAUKEE, WIS., July 1.—Fifteen perfect scores, five cars not completing the course and four penalized from 50 to 725 points, was the net result of the first annual reliability run of the Milwaukee Automobile Trade Association on Saturday, from Milwaukee to Madison and return. Road conditions were excellent and a few of the drivers who were unable to resist the incentive to speed were arrested. Perfect scores were gained by Buick, Wayne, Peerless, Kissel-Kar, Stoddard-Dayton, Mason, Rambler, Pope-Hartford, Premier, Winton, Buick and Reo.

**SIXTY-ONE IN LOS ANGELES ENDURANCE.**

LOS ANGELES, June 27.—Sixty-one automobiles of varying type and horsepower are speeding over 180 miles of diversified road between here and Lakeside. The occasion is the annual endurance run and economy test of the local Automobile Dealers' Association, and will require two days to decide. Starting from Eighth and Market streets this morning, Riverside, the noon control, was reached under a distressingly hot sun. Elsiene is the night control.

## NEW PACKARD GARAGE IN NEW YORK.

One of the latest and most notable of the recent additions to New York's row of new garages is that of the Packard Motor Car Company on the northwest corner of Broadway and Sixty-first street, which is just having the finishing touches put on it.

The new Packard headquarters has a frontage of 114 feet on Broadway in the heart of the newest automobile row, and has a front of 196 feet on Sixty-first street. As the corner is less than a right angle, the north wall measures only 139 feet. The building rises to a height of four stories and has a deep basement.

The total cost of the building is approximately \$200,000. Except in the salesroom and offices, no attempt at ornamentation has been made, but every precaution known to building science has been taken to make the establishment proof against destruction by fire, and substantial construction and mechanical convenience have been striven for and secured. A steel skeleton supports the weight, and is encased in concrete walls and floors. The supporting steel columns are covered with cement, and no inflammable material is used except for window casings and, in the salesroom and offices, for wainscoting and furnishing. In the

PACKARD'S NEW ESTABLISHMENT ON AUTOMOBILE ROW.

basement is a 50,000 gallon reserve tank of water and on the roof is another of equal capacity, both connected with an automatic sprinkler system. A steam pump in the basement raises water to the roof. There is a low pressure steam heating plant in the basement, and the lighting throughout is by electric lights, so that there is no open flame. The gasoline storage is in a light court on the north side of the building outside of the building walls. Here a large number of tanks, each having a capacity of only one barrel, is embedded in cement. They have no opening to the air except by lead vent pipes rising above the roof of the building. Each is provided, of course, with filling and emptying pipes. Fire walls of brick separate the salesroom and offices from the garage portion of the first and mezzanine floors, and similar walls shut off the repair shop on the Broadway side of the third or top floor, corresponding with the fourth floor in other buildings, and also the stock room, tire room, coat room and other small rooms on the mezzanine or second floor. Fire doors, sheathed with copper, close automatically in case of fire.

All floors and the basement are connected by a pair of electric elevators on the west side of the building. Each of these measures 20 by 13 feet and is of five tons capacity. It is open at front and rear, so that a car can be run on at one end and off at the other on any floor. Directly in front of the elevators at each end on every floor but the mezzanine floor is a turntable 15 feet 4 inches in diameter. In the basement there is one turntable.

Of course, the show feature of the establishment is the salesroom. This extends across the full width of the Broadway front and has a large main entrance near the middle covered by an imposing metal canopy supported against the building. This is in

heavy iron and presents an effective contrast against the white front of the building. The show room has a depth of 84 feet on its longest side and a height of 28 feet, rising through two floors. Its area is broken by several fluted columns that support the ceiling. These columns and the sides of the room are paneled to a height of 8 feet with weathered oak, above which the walls are finished in imitation grained stone. Extending across the entire rear of the room is a mezzanine gallery 94 feet long by 20 feet wide, admittance to which is by a marble stairway at the middle. The stairway and balcony have an ornamental metal railing and the floor is covered with asbestolith. On this balcony the offices will be located. A passage from the gallery communicates with the mezzanine floor of the garage, where the directors' room, coat room, toilets, tire room and stock room are located.

Reception rooms for men and women are provided on the ground floor at the rear of the salesroom.

The whole of the second floor—above the mezzanine floor—is devoted to the storage of cars. It has a washing stand and on the north and west walls is a metal gallery for lockers.

The front of the top floor is occupied by the machine shop, which will be unusually large and well equipped. The rest of the floor is for car storage. Cement stairways, shut off by fire walls, extend through the full height of the building.

## AUTOS PREVAIL OVER ROUGH ROADS.

Automobiles are superior to the roads they are given to traverse and the crying need of cross country travel is better highways. A good demonstration of the ability of autos to conquer roadstead difficulties was made last week by S. D. Waldon, sales manager of the Packard Motor Car Co., of Detroit, who, driving a 1908 Packard "30" test car, with a load of four persons and heavy baggage, came from Detroit to New York in two days, despite heavy rains and a succession of innumerable miles of torn-up and almost impassable roads.

The start was made from Windsor, Ontario, at 4:25 Monday morning. Windsor, by the way, is a peculiar place. There is no garage and no livery stable will take an automobile. The car was left standing in the street before a hotel during a heavy rain Sunday night.

Monday's course lay through Canada to Buffalo by way of London and Hamilton. The road during the morning was deep with mud. Near Niagara Falls a stop to fix a rear tire blow-out resulted in car and party going into receivership, the receiver being a country constable with a tin badge and blue pants. Some one in St. Davids had telephoned ahead that a certain car had exceeded the fifteen-mile speed limit of that village, and upon this absent evidence the Packard party was haled before the magistrate, chief of police, et cetera, of Niagara Falls, and mulcted \$25 and costs. This delay, on top of the puncture and the customs proceedings at the bridge, lost over two hours.

No stop was made at Buffalo, but about half way between there and Rochester a veritable cloudburst drove the tourists into a friendly barn for half an hour. Then, with tire chains on, a slippery way was made into Rochester.

The second day was like driving across a newly-plowed field as wide as New York State. Being in a hurry to spend the State road improvement appropriation, supervisors everywhere had plowed up the highways preparatory to laying stone roads.

By persevering going, however, the smooth road between Poughkeepsie and New York was reached before dark and the rest of the run was a quiet glide down to Manhattan.

In speaking of the trip Mr. Waldon said that the most remarkable point seems to be that if a car could traverse 797 miles of such varying and mostly poor roads in two days it showed a traveling possibility of which the public seems hardly to be aware. He concluded:

"Give us roads like some of the stretches along the Hudson, all the way from New York to Detroit or Chicago, and automobiles will develop a new mode of travel which will be simply amazing in its extent. Autos are good. We need good roads."

**AMERICAN ROADS BETWEEN TWO IMPORTANT CITIES.**

This photograph gives some idea of the class of roads encountered between the two important middle western cities of Toledo and Detroit. It was taken directly in front of the post-office of one of the villages on the route some weeks ago. The road has improved materially since, but it is almost impassable during the winter and early spring months owing to the rains.

### AUTO STAGES ONCE MORE TO THE FORE.

SEATTLE, WASH., June 30.—Within a short time there will be a regular automobile stage service between Kirkland and Fall City, arrangements for the inauguration of the line already having been made by a number of business men in the former place where a garage is now being built to house the machines. As a starter a 30-horsepower gasoline 'bus with a seating capacity of twenty people will be put on.

TORONTO, ONT., July 1.—Under the Dominion charter recently granted a newly incorporated company, a 'bus line will be inaugurated in this city during the coming week. The first part of the equipment, consisting of five electric 'buses built by the Autocar Equipment Company, Buffalo, N. Y., has just been delivered here and will be put into service within a few days. The 'buses will be run on the Belt Line, along King street, up Jarvis to Bloor, along the latter to St. George, returning by way of Beverly and Queen streets to King. Four horse-drawn stage coaches have also been acquired, and it is expected that the equipment will have a capacity of half a million passengers annually. Similar systems will also be operated in Montreal and Ottawa.

### FOR A NEW AMERICAN ANNUAL TOURING EVENT.

A. W. Church, of Wyckoff, Church & Partridge, has just come forward with a proposal to inaugurate another American touring event, for which he will offer a handsome trophy. Realizing the necessity for preparing an intelligent set of rules well in advance, the matter of formulating these has been taken up and it is expected to make them public early in August. The route has already been decided upon and will consist of a circuit of several hundred miles, starting and finishing at New York, via Hartford, Conn., Boston, Mass., Concord, N. H., Albany, N. Y., Columbus, O., Charleston, W. Va., Richmond, Va., Washington, D. C., Harrisburg, Pa., and Trenton, N. J. Each of these cities being the capital of its State, arrangements will be made to have the party of tourists meet the governor, presenting to him a complete report of the roads passed over in his jurisdiction, thus furthering the good roads movement at the same time. No date has been set for the starting of the event, but it will be held as early in the year as road conditions will warrant and the schedule will be such as to allow ample time for rest at each of the stopping places mentioned. Designs are being prepared for the trophy, which is promised to be as fine an example of the goldsmith's art as can be produced.

### BALDWIN AIRSHIP'S SUCCESSFUL FLIGHTS.

HAMMONDSPORT, N. Y., July 1.—Capt. Thomas S. Baldwin made two very successful flights in his "Twentieth Century" airship at Hammondsport, N. Y., June 27. The first ascension was made with a single propeller and the second with a double propeller, driven by the G. H. Curtiss four-cylinder motor. The ship has a cigar-shaped gas bag, 57 feet long and 17 feet in diameter, built of balloon silk and covered with netting. The bag has a capacity of 9,000 cubic feet, and is filled with hydrogen gas. The car is 42 feet over all and 3 feet deep. The motor is a four-cylinder, air-cooled, 16-horsepower machine designed especially for this work. The ascensions were made from the factory of the G. H. Curtiss Manufacturing Company.

The Curtiss Company is also making a motor for Capt. William Mattery, of the Chicago Airship Company, to be eight cylinder and of 32 horsepower. Another 8-cylinder 32-horsepower motor is being built for Mr. Williams, inventor of the Williams typewriter, for a "heavier-than-air" airship. The firm also sold the United States Government four airship motors recently.

### INTEREST HIGH IN COMING ATLANTIC CITY MEET.

Sixteen events, two of the championship order, have been arranged for the coming Atlantic City meet which will be held on two days in August, the 5th and 6th, and considerable interest is already being shown in the holding of the meet.

The Atlantic City Automobile Club has already announced the details of the week's program, which is to consist of two days racing on Ventnor Beach, Monday and Tuesday, August 5 and 6, followed by a grand floral parade on Wednesday, the route lying along the seven miles of asphalt on Pacific avenue with the grandstand and judges' box at the City Park. This parade is to be one of the chief features of the carnival, and preparations are being made for it on an elaborate scale, handsome prizes for the winners in each class having been donated by the carnival association and local business houses. The week will end with a three days' automobile show.

The racing will be held under the auspices of the local club, which has invited the following well-known autoists to act as the officials of the meet: Honorary referee, Jefferson De Mont Thompson, chairman of the A. A. A. racing board; referee, A. R. Pardington; judges, Raymond Healey, A. G. Batchelder and Alfred Reeves; starter and clerk of the course, F. J. Wagner; assistant starter, David J. Barrett.

THE PRINCESS OF WALES ALIGHTING FROM LORD BLYTHEWOOD'S WHITE STEAMER IN LONDON.

EXTERIOR VIEW OF THE NORTHERN PLANT AT PORT HURON, MICH.

TO anyone not intimately connected with the automobile industry in this country it is extremely difficult if not altogether impossible to form any adequate idea of its extent, and as for looking into the future, even such a short period as half a decade, with a view to gauging its probable expansion in that time, this is something that is beyond even the most expert. Statistics are impressive, to be sure, and appalling rows and columns of figures with their endless ciphers look just as imposing as the most ardent advocate of home industry could possibly wish, but after all they are a meaningless array of numerals that convey little if any definite idea to the casual reader, who generally passes them by with hardly more than a glance.

Pictures speak a far more telling language than do either figures or description, and in this connection the photographs of one of the Northern Motor Car Company's plants, located at Port Huron, Mich., are interesting. This particular plant represents a recent expansive move on the part of the builders of the Northern, whose main works are located at Detroit. In consequence, the new addition is devoted solely to the production of the Northern light cars—the two-cylinder type which have been specialized by this firm for several years. The plant, which is remarkably complete and furnished with the most modern equipment throughout, is in charge of W. H. Hutton, Jr., and during the manufacturing season just past has averaged a weekly production of fourteen cars, which is still being maintained. The photographs show the exterior of the main building, together with a number of the cars in the process of being tried out, also a view down one of the lines of lathes in the machine shop and a corner of the chassis assembling room.

The devotion of an entire plant to the production of but one model, turned out by a firm of builders, is a typical instance of the extent to which specialization is being carried in this field by the American automobile manufacturer, the Northern Motor Car

Company using its original plant at Detroit entirely for the building of the four-cylinder cars made under this name. Such an arrangement facilitates production by confining the attention of the working force in each plant to the requirements of but one type of car, so that all confusion is avoided and it is easier to closely maintain a prearranged system of manufacture throughout every department.

### COL. SPRAGUE TO CELEBRATE.

NORWALK, O., July 1.—Everyone knows Colonel Sprague, the man who makes automobile tops, and by this time everyone in the trade knows that he is going to celebrate the glorious Fourth next Thursday afternoon, for the invitations to come and make merry have been spread broadcast. No details are given, but a good time is promised to everyone who can come, the program calling for a change of performance every ten minutes, and as the invitation, which is in the shape of a flag ornamented cannon-cracker, reads, "there will not be a minute but that you can be in it," so that it is safe to say that anyone who happens to be in Norwalk on the Fourth will have occasion to remember it.

### A. L. A. M. PRODUCES A TECHNICAL DIGEST.

Running on the familiar lines of certain literary journals, the "Digest of Current Technical Literature," the first number of which has just come forth under the seal of the Association of Licensed Automobile Manufacturers, presents a résumé of the contents of a number of the technical journals of America and England. According to the introduction of the weekly, of which Coker F. Clarkson has undertaken the editorship, "the Digest is primarily for the use of A.L.A.M. engineers, being intended to furnish in brief form a résumé of what is new or worthy in automobile design and construction." Clippings from journals published in foreign languages are promised in future numbers.

### FRENZIED FINANCIER BUYS WHITE STEAMER.

BOSTON, July 2.—Thomas W. Lawson, of frenzied finance fame, who has long been known for his devotion to the horse, has at last succumbed to the charms of the automobile. During his last trip abroad, from which he has just returned, Mr. Lawson did considerable touring in a Mercedes through Italy, and made the run from Nice to Paris in a Mors, whence the order for the White, which is the first car he has owned. In contrast with its name, it is painted a dead black, and is said to be the only car of its color in this city. The car will be used principally for carrying its owner between Dreamworld and his Boston office.

LONG LINES OF LATHES IN THE MACHINE DEPARTMENT.

CHASSIS-ASSEMBLING ROOM AT THE NORTHERN PLANT.

RECORD-BREAKING SHIPMENT OF ELECTRICS SENT FROM THE COLUMBUS BUGGY COMPANY TO A. V. HART, ROCHESTER, NEW YORK.

### "BUGGYMOBILE" SCORES A BIG SUCCESS.

When a concern of the size of the Columbus Buggy Company, Columbus, Ohio, takes up the investigation of a thing some interesting and hitherto unrealized facts are likely to be brought to light. C. D. Firestone, the president of the company, sees a large future for the popular-priced automobile—the horseless carriage of the farmer—and the production of the latter is to be undertaken on the same generous scale that has characterized the making of horse-drawn vehicles by this firm for a number of years past. The designer of the new "Buggymobile," as it has been christened, is C. C. Bramwell, who, with his assistant, gave one of the cars a five-day try-out last week. The home stretch of the run, from Indianapolis to Columbus, a distance of 200 miles, was made in the excellent running time of 14 hours 17 minutes, on a consumption of but eight gallons of gasoline and three pints of lubricating oil, despite the fact that the car was kept travelling through thunderstorms that almost amounted to cloudbursts, and the roads were in very bad condition as the result.

The power plant of the new buggymobile consists of a ten-horsepower two-cylinder horizontal-opposed engine of the air-cooled type, which weighs a trifle less than 220 pounds with all its accessories, while the car in complete running order only tips the scales at 700 pounds, so that the proportion of power to weight is very high and easily accounts for its ability to make thirty miles an hour over poor roads. Final drive is by side ropes, controlled by a hand lever, and the cars are equipped with either phaeton or Stanhope bodies, to sell at \$750. That the builders have every confidence in the ability of their production is shown by the fact that they have entered a Buggymobile in the A. A. A. tour, where it will have to compete with some of the highest-priced cars built, and its performance will be watched with considerable interest.

### POPE-TOLEDO WINS DISPLACEMENT HANDICAP.

CLEVELAND, O., July 1.—On the occasion of the recent Stucky hill climb, held under the auspices of the Cleveland Automobile Club, it was prematurely announced by the daily papers that Campbell, driving the Darracq, was the special event winner, while a later report of the committee's figuring showed the Stoddard-Dayton to have gained the honor. The event was known as a piston displacement handicap, and it evidently took a great deal longer to figure the relative standing of the cars than it did to run the race, as it is now formally announced that there was an error in the former computation, and that the Pope-Toledo, driven by J. P. Grady, was the winner by a safe margin.

### CROSS COUNTRY RUN OF THE BLUE-STREAK.

For the double purpose of proving the reliability and efficiency of the 20-24-horsepower air-cooled motor forming the power plant of the Logan Blue-Streak, as well as to demonstrate the strength and running qualities of the car under high pressure, so to speak, B. A. Gramm, vice-president and general manager of the Logan Construction Company, Chillicothe, O., accompanied by a mechanic, left Toledo on Monday morning, June 24, at 5 A. M., bound for Plymouth, O., the route thus constituting a run across the State of Ohio from Lake Erie on the north to the Ohio River on the south. The car used for the run was taken directly from stock without any special preparation in the way of tuning up and had been sent to Toledo, O., over the roads two days previous, the driver then reporting the latter to be in very poor condition, which was made far worse by continued rains during the day previous to the start.

No attempt was made to spare the car in any way, and despite the extremely bad state of the roads excellent time was made, the first stretch of 32 miles to Bowling Green being covered in 50 minutes, while the total elapsed time for the distance of 252 miles was made in less than 14 hours, stops having been made at eight different towns. A remarkable feature of the run, considering the nature of the going, was the small gasoline consumption, which only totaled eleven gallons. Immediately upon its arrival at Plymouth it was again sent over the road back to Chillicothe, an additional 50 miles, all of which was covered without the necessity for touching a bolt or nut or making the most minor adjustments. The amount of mud encountered throughout the run was so great that the car was literally buried under two or three inches of it and could scarcely be recognized, even by those most familiar with its appearance.

### OLDSMOBILE PERFORMS STRENUOUS TEST.

BOSTON, July 2.—In addition to setting up a new track record for 100 miles at Readville on Memorial Day, the Oldsmobile which then carried off the honors was put through a far more strenuous test last week. Driven by A. E. Morrison, the local agent, and with Arthur Adams and Fred Allen in the car, a start was made from here on Wednesday afternoon. New York was reached Thursday morning, and after a stop of but a few minutes the return trip was undertaken, reaching Boston late the same night. The engine ran constantly for thirty-one hours, covering a distance of 500 miles during the entire running of which both the high gear and the bonnet were sealed.

POPE-TOLEDO TESTING CREWS STARTING FROM THE FACTORY FOR THEIR DAY'S WORK.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

A new factory, 80x400 feet, is being erected by the Simplex Motor Car Company, of Mishawaka, Ind. It is expected to be ready in two months.

A 50-horsepower Matheson touring car has been shipped to Raton, New Mexico, for H. A. Ensign, of New York, by J. M. Quinby & Co., of Newark, N. J.

Particulars from abroad show that the first four cars to finish in the German Emperor's cup race were equipped with Truffault-Hartford shock absorbers. They included the winning Fiat, the Pipe and the two Opels.

Orders for one or more cars have been received by the Brush Runabout Company, Detroit, Mich., from every continent, including Europe, Asia, Africa, Oceania, North and South America. The first shipment was made this week.

An increase in the capital stock of the General Accumulator and Battery Company, of Milwaukee, Wis., is being contemplated, and negotiations are pending with a view to contracting for the sale of the entire output for the balance of year.

Two reasons are advanced by the general selling agents for the Genesee tires (the Thomas D. Buick Company, of Flint, Mich.) for the exceptional favor with which the tires have been received by automobilists. One reason given is the plan of selling the tire direct from the factory to the owner, eliminating the middleman's profits, and the other the 5,000-mile guarantee.

New York State registrations for the month of June show that the past thirty days have constituted another record-breaking month, the figures received by the American Motor Car Manufacturers' Association showing that 2,039 cars were enrolled. Of these the Ford again leads with a total of 243, the Cadillac being next with 147 and the Maxwell third with 132.

Departing from its policy of confining the sales of its cars to the neighboring territory, though as a matter of fact many Gaeth cars have been sold outside of Cleveland, the Gaeth Automobile Company has recently placed an agency with the Chicago Garage Company. R. E. Hawkins, a Gaeth owner, has also been appointed sales agent in Cleveland for the car.

Since the amalgamation of the Ajax Tire Makers with the Grieb Rubber Company, and the announcement of Horace DeLisser, president of the company, that a new location was decided upon, numerous efforts have been made by other cities to secure the plant. The company owns its own plant in Trenton, and has a piece of property 350x450 feet alongside the railroad tracks. Announcement of the new location may be expected within a couple of weeks.

In view of the uncertainty of the 1907 Vanderbilt cup race, the Locomobile Company of America is not building a new racing car. This, however, does not mean that the Locomobile will not be a contender in any big road race held this year, because the two racing cars which Joe Tracy had at the Vanderbilt cup course last fall are available. One was the winner of the Elimination and the other, driven by Tracy, made the fastest lap in the race.

The Mora Motor Company, of Newark, New York, has just awarded the contract for the erection of the main building of their new factory to the Voshall-Perey Construction Company, of Rochester. The structure will measure 60x400 feet, a portion of it being two stories high and the remainder three stories. It will cost about \$60,000, and is the first of a series of buildings which the Mora Company will erect at Newark for turning out its cars.

Under the title of the F. N. Motor Club of America, a unique organization has just come into being in New York City, with headquarters at 2208 Broadway. The officers are: President, David Dessau; vice president, Hiram Powers; treasurer, F. V. Littlefield, and secretary, Erik J. Peil. As its name indicates, the membership of the new club is confined entirely to riders of the F. N. four-cylinder motorcycle, weekly runs being held from the club's headquarters every Sunday.

George C. Tyler, Booth Tarkington, and Henry Leon Wilson, now touring Europe on a 45-horsepower Renault, landed the first automobile ever seen in Christiania. Three thousand dollars duty was at first demanded, but finally the machine was allowed to go free, preceded by three policemen to prevent any faster speed than a walk. Telegraph messages had to be sent ahead to arrange a supply of gasoline on the route, and, there being no trains in Central Norway, most of it had to be sent up by boat. It took a week to cover 500 miles. Frequently Norwegian peasants dropped on their knees on catching sight of the automobile.

"The sale of automobiles by letter or catalogue is productive of no results in the Netherlands," says information received from Holland by the American Motor Car Manufacturers' Association. The dispatch states that American cars are little known in Holland, and importers are overflowed with catalogues sent from America. A prominent Amsterdam physician who was attending a recent automobile exhibition in that city asked if motor cars were made in the United States. The A. M. C. M. A. has strongly urged its members to open agencies in this European territory. Ten years ago this was an excellent territory for the American bicycle.

### RECENT BUSINESS CHANGES.

The Breeze Carbureter Company, of Newark, N. J., has recently been organized to take over the business of the Breeze Motor Manufacturing Company, and will remove from 28 Main street to 276 Halsey street.

Sports, Limited, has just moved from its old quarters, at Fifty-seventh street and Broadway, to a larger establishment at 2049 Broadway, near Seventy-first street, in the heart of automobile row. This concern, of which John Bogan is the manager, handles the new Royal motorcycle, also the R.-S. motorcycle, in addition to a large line of automobile and motorcycle supplies and sporting goods generally.

### NEW AGENCIES ESTABLISHED.

A contract has been made by George K. Wheeler, sales manager of the Columbus Buggy Company, for the exclusive sale of

their Columbus electrics in Porto Rico to Robert Graham, of Ponce.

The Thomas D. Buick Company, of Flint, Mich., general sales agents for the Genesee tires, has opened a branch house in Chicago, at 87-89 Ashland boulevard, near Madison street. L. F. Burges has been appointed branch manager.

An agency for the Mitchell automobile has been opened in Milwaukee, Wis., by Brown & Friend, of Chicago, Ill. The McDuffie garage, on Wisconsin street, has been rented, but will be removed to 148 Eighth street as soon as the new building under construction is ready.

### PERSONAL TRADE MENTION.

E. W. Swanbrough, for several years in the automobile business in Denver, has become general manager of the Pacific Coast Automobile Company, Seattle, succeeding C. Z. Salling, who retires because of ill health.

Gaston Rheims, of the C. G. V. Import Company, sailed for France on Thursday in order to arrange for a complete exhibit of this make to be shown at the Importers' Salon, in Madison Square Garden, at the end of next December.

E. E. Allyn, of the Allyn Brass Foundry Company, of Cleveland, Buffalo and Detroit, has gone to Germany, France and England to investigate foreign foundry practices and a new process of melting aluminum. He expects to return in August.

Chester Clark Boynton resigned as secretary and general manager of the Franco-American Auto Supply Company, 1404-1406 Michigan avenue, Chicago, June 1, to take charge of the entire automobile accessory business of the Excelsior Supply Company, 233-237 Randolph street, Chicago. Mr. Boynton assumed his new duties July 1.

### NEW TRADE PUBLICATIONS.

Blomstrom "30" automobiles are presented to the public in an illustrated catalogue just issued. Illustrations of the runabout and touring car models, as well as of the engine and transmission, are given. The catalogue can be obtained from the Blomstrom Manufacturing Company, Detroit.

"Automobile Comfort" forms the title of a 16-page booklet sent out from the Ventilated Cushion & Spring Company's headquarters, at Chicago, descriptive of their rough-rider springs. Artistically the book is worthy of attention, and the question of springs is of considerable interest.

"Decidedly Useful" is the verdict which must be passed on the vulcanizer instruction booklet issued by the Auto Improvement Company, of 2128 Broadway, New York City. The explicit instructions and wealth of illustrations should enable any intelligent person to carry out tire repairs with the vulcanizer and tools supplied by this firm.

Something about the dust problem is related in a dainty brochure issued by the Barrett Manufacturing Company, of New York, being in large part an extract from an address by J. W. Howard before the American Road-makers' Association. The booklet sets forth the advantages of Tarvia, the dust layer, and gives particulars of tests made in various parts of Europe and America.

INFORMATION FOR AUTO USERS.

**Diamond M Cement and Solution.**—Sending a shoe or an inner tube to the repair shop every time it suffers the slightest puncture is not alone highly inconvenient, but very expensive—more so than the average autoist likes it to be when he comes to figure up the total expenditure on this account alone at the end of a season's running.

DIAMOND M TIRE REPAIR OUTFIT.

To avoid the necessity of this Charles E. Miller, 97-99-101 Reade street, New York—the man who handles everything under the sun for the autoist except the complete automobile—has put a special repair kit on the market. It is known as Diamond M Vulcanizing Substitute, and is a cold process, only requiring a cement and curing acid, the complete kit consisting of 1/4 pint of each, with a cement and an acid brush, in a neat containing case. The repair is simply made and produces the same effect as vulcanizing, the acid curing the cement to the rubber, thus making the patch integral and permanent. The Diamond M cement and acid cure solution is also put up in various sizes, ranging from half a pint to a gallon, and may be had from the Miller headquarters in New York or any of the branch stores, located in Cleveland, Detroit, Buffalo, Boston and Philadelphia.

**New Winchester Speedometer.**—In order to meet the demand for an accurate speed and distance recording instrument at a lower price, the Winchester Speedometer Company, Motor Mart, New York City, have recently introduced a new model of their well-known instrument, to

NEW MODEL WINCHESTER SPEEDOMETER.

sell at \$50 complete. Neither the mechanism, material nor workmanship has been changed, and the new instrument incorporates every feature distinguishing the highest priced ones. The sole change consists in the substitution of a smaller odometer—about a third less in size—with a corre-

sponding reduction in the price. The high-speed record hand, showing the maximum speed attained, has also been incorporated in the new model. This auxiliary hand, which is a bright red to distinguish it, is carried by the regular indicating hand to the point representing the highest speed attained, and remains there until released by the touch of a button, when it flies back to the speed that the car is then making, or to zero if the latter be stopped. The new Winchester registers speeds up to 60 miles an hour, maximum speed attained and trip and season mileages.

**Advance Coil Current Indicators.**—There is nothing that gets so much abuse at the hands of the average autoist as the battery, and next to it comes the coil. In fact, the former is abused on account of the shortcomings of the latter, and the reason lying at the foundation of it all, in the great majority of instances, is the fact that most coils are adjusted by guess-work, or by the sound of the trembler, which is the same thing. To avoid this the Eldredge Electric Manufacturing Company, Spring-

ADVANCE SPARK COIL CURRENT METER.

field, Mass., have brought out the Advance Spark Coil Indicator, for measuring the amount of current consumed by the coil—a service which the ordinary ammeter does not perform satisfactorily. As no coil should ever consume more than two amperes, no matter how poorly it is working, this is the maximum marked on the scale, the calibration being by tenths of an ampere. For convenience in using, the instrument may be connected to the usual switch by means of the double connecting cord furnished, or it may be connected at any point in series with the battery and primary of the coil to be tested. Most coils work best on less than an ampere of current, usually six to nine tenths of an ampere, and a properly adjusted coil means long-lived batteries and troubleless contact points, so that the initial cost of the instrument will be saved several times over in the course of a single season.

**K-B Universal Joints.**—One of the chief essentials of the transmission of the power on a shaft-driven car consists of a good universal joint, and nothing has served to bring about improvement in this relatively small part of the make-up of the automobile so much as the general adoption of the propeller-shaft drive. The Kinsler-Bennett Company, Inc., Hartford, Conn., who are specialists in this field, have recently brought out a new form of ball-

bearing universal joint, which is claimed to have so many points of superiority over most existing forms as to be entirely in a class by itself. As will be plain from the illustrations, this new joint consists of two

SEMI-SECTION VIEW K-B JOINT

plates and two forks, each of the latter having recessed ball seats, with corresponding seats in the plates for receiving the balls between them. All parts are made from drop forgings, and the balls are of the highest grade. Four bolts for holding the parts together and a dust-proof shield, which also serves to retain the necessary lubricant, complete the joint, which may be easily dismantled and reassembled in a few minutes. Each bearing is well provided with oil grooves and vents, so that a single filling of the cover is good for 12,000 miles, or more than the ordinary season's running. Several months were occupied in preparing tools, fixtures and gauges for the manufacture of these universal joints, so that all parts are guaranteed to be interchangeable.

**Cardinal Spring Construction.**—Absolute perfection is hard to attain, and the makers of this patented form of spring construction for automobile upholstery—the Barber Manufacturing Company, Anderson, Ind., do not claim that they have achieved it, but that their springs give absolute satisfaction, which, in the end, is the same thing. As will be apparent from the illustrations, showing the manner in which the

CARDINAL METHOD OF SPRING ASSEMBLY.

spirals are assembled and held is radically different from the usual type, but also permits of assembling the springs of a cushion in a fraction of the time ordinarily necessary, the base of the spiral is so constructed as to render it impossible for the ring to come in contact with the bar, thus making it noiseless and adding to the capacity of the spring, while the fact that the bars are tempered steel arches and all spirals are made from a high-grade of spiral wire, re-tempered, insures long life under the most severe service.

The Safest Way to Store Gasoline

is the NATIONAL way, is the only economical, safe and convenient way, because there is no danger, no evaporation or waste, the gasoline is in the tank or in the car.

The NATIONAL is the only pump that discharges gasoline at every movement of the crank, it saves one half the labor and one half the time to pump gasoline, there is no evaporation or leakage, the tank is buried underground, the pump may be put in the building in a convenient place. It is the safest way because it meets all of the requirements of The National Board of Fire Underwriters.

The NATIONAL is also adapted to private motorist, also for lubricating oil storage.

Ask for catalogue, it will explain all about the National System.

**STEVENS-DURYEA**—Model R, 1906 touring car; new Aug. 1; owner has bought 6-cylinder, same make. Box 1483, Springfield, Mass.

**STEVENS-DURYEA**—Three second-hand, 2-cylinder runabouts, \$650 to \$900; three second-hand 4-cylinder Stevens-Duryea touring cars, \$1,500 to \$2,000; all these cars thoroughly overhauled by factory experts and are in first-class condition; they were taken in trade for new models. R. R. Kimball, 2026 Farnam St., Omaha, Neb.

**TRUCK**—One 6-cylinder for sale; 35-h.p., 2½-ton truck, body to suit, price \$2,000, fine new job; also one 11-passenger pleasure car, 4 individual seats, 7 in tonneau, 25-h.p. opposed engine, everything new and first-class, price \$2,000, top and curtains. Watrous Auto Works, Elmira, N. Y.

**WINTON, MODEL K**—1906 Model, 30-h.p. like new; fully equipped; top; guaranteed perfect; to close quickly, price \$1,100. H. O. Koller, 26 S. Fifth St., Reading, Pa.

**WINTON, MODEL M**—1907, new 40-h.p., with top, lamps, etc., cost \$3,725; will sacrifice for \$3,000 cash; can inspect at Winton Garage, 70th and Broadway, or inquire C. Thorne, 30 Pine St., New York.

**WHITE STEAMER**—Brand new 1907 model, for sale at a bargain. Address E. S. Youse, Reading, Pa.

**WHITE STEAMER**—1905 model, with 1906 burner, 1907 pumps, new thermostat; driven 4,000 miles; now being assembled after a thorough overhauling by the owner; if in the market for a White car, it will pay you to investigate further. H. W. Beach, Montrose, Pa.

**WHITE TOURING CAR** for sale; 1907 Model H; color, maroon; has black pantasote cape top, acetylene lamps, extra shoe, two tubes, tire holders, Warner speedometer and full equipment of tools; car in excellent condition; run about 1,500 miles. Demonstrations by applying to Peerless Motor Car Co. of New England, 178 Columbus Ave., Boston.

**WHY auto prices vary at different places**—The small dealer has to make expenses and profits off a few sales; he is compelled to ask high prices; those who buy to sell again naturally rush up the selling figures; with us selling on 5 per cent. commission, with no charge for storage, necessitates the sale of a car almost as soon as it is consigned to us; to sell quick, prices must be low, and this is why our selling figures are from \$200 to \$800 less than others ask. Tonneaus and touring cars: Panhard, 4-cylinder, semi-limousine, \$1,250; Packard detachable tonneau, \$1,000; Fiat, 4-cylinder, \$2,000; Corbin, 4-cylinder, \$1,000; Aerocar, 4-cylinder, \$1,500; Buick, \$650; Reo, \$575; Yale, \$550; Thomas, 50-h.p., \$1,250; Locomobile, 4-cylinder, \$1,250; Wayne, 50-h.p., \$1,600; Pope-Toledo, 4-cylinder, \$1,800; White steamer, \$700. Most of the above cars have tops, horns and full lamp equipments. Runabouts and electric: Decauville, 4-cylinder, practically new, \$950; Decauville, 2-cylinder, \$350; Duryea, \$300; Knox, \$300; Pierce-Arrow, \$300; Crestmobile, \$275; Buckmobile, \$350; in electric we have very handsome broughams, \$950; stylish Cabriolet, \$750; Baker runabout, \$350; Ajax, \$250. Other tonneaus \$250 up, and runabouts \$150 up. To secure extra low prices make bid on the car you like; if the owner is especially hard pressed for cash, he is likely to accept your offer. Manhattan Storage Co., Largest Auto Dealers in the

World, 334-340 W. 44th St., two blocks from 42d St. station 9th Ave. "L"; three blocks from Broadway, New York City.

**YALE TOURING CAR** for sale; big bargain; in first-class shape, newly painted, good tires, thoroughly overhauled, top, with storm shield of glass, 2 gas lamps and generator, 2 oil side lamps, large tail lamp, clock, mechanical driven roller, all tools; is a very desirable car of 18 to 20-h.p.; have another car, no use for two; \$600 will buy. E. E. Ritter, Milton, Pa.

### Cars Wanted

**RUNABOUT, 4-cylinder**, wanted; of first-class make, with rumble seat. I have a first-class 2-cylinder, 14-h.p. delivery wagon, as good as new, which I wish to make a trade; this delivery wagon cost \$1,400. Address F. J. H., care The Automobile.

**TOURING CAR, 4-cylinder**, wanted, or runabout; also an air-cooled motor and 2-cylinder motorcycle. "Motorcycle," care The Automobile.

**WHITE STEAMER**, Model H wanted; state condition and quote lowest price for spot cash. Metal Stamping Co., Jackson, Mich.

**Pater-Noster**  
THE IDEAL SHOCK ABSORBER  
A Perfect Spring Control

U. S. Patent, Oct. 24, 1905. Patents all over the world.

The Pater-Noster absorbs all jars coming from whatsoever direction. The upward and downward movement are separately controlled — each movement is checked separately and individually. The Pater-Noster will keep its adjustment if once set. No readjustment required. All surfaces are hardened.

The Pater-Noster is self-lubricating. All mechanism under dust-proof cover.

The Pater-Noster is the only adjustable Shock Absorber on the market. It is scientifically and mechanically perfect in its construction.

# FIAT

## Wins Grand Prix

For the third time within the past three months FIAT wins a GREAT INTERNATIONAL VICTORY, — proving beyond all question that for speed, endurance and consistent performance it is PREEMINENTLY THE LEADER.

### Grand Prix Race in France, July 2d

477 mile contest, 38 competitors, FIAT 1st.

### Kaiser Cup Race in Germany, June 15th

300 miles, 91 competitors, FIAT 1st, 5th and 6th.

### Targa Floria Stock Car Race in Italy, April 21st

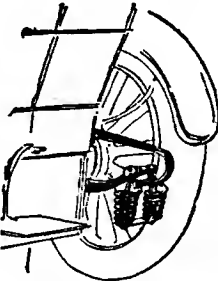

300 miles over mountains and bad roads, FIAT 1st, 2d and 4th out of 48 competitors.

These contests have been more severe than any ordinary hill climbs or endurance contests, and to win three in succession, against the BEST CARS AND DRIVERS OF THE WORLD, is a record that has NEVER BEFORE BEEN EQUALED.

**A Tail Lamp That Will Stay Lit**

It is very humiliating to have to appear in court for driving without your tail lamp lit, and it's really not your fault, as you are sure you lit it just a few minutes before; but it's the old story—the lamp is not built right, and just as soon as you start your machine it dies down and goes out, and one fine would more than pay for the best tail lamp made.

Ham's is the best. It's built on our genuine "Cold Blast" principle and is guaranteed not to blow or jar out. Beside the red light it gives a powerful white light, and the side handle makes it very convenient to use for inspecting engine or car in case of a breakdown. It is fitted with our new safety handle.

**Ham's NEW SAFETY Bracket.**

This will be appreciated by all who see it.

With our new Safety Locking Handle and Bracket you do away with the constant annoyance of losing your lamp or having it stolen.

Our Auto Booklet will interest you—write to-day. Address Dept. "B"

# HOLSMAN

**FIVE YEARS OF SUCCESS.**

The Holsman automobile has now been on the market five years and has long since passed the experimental stage. It is built high enough to travel the country roads like a carriage and can be run twelve months in the year. It clears the centre of the road by eighteen inches, and therefore has **twice the advantage** of the ordinary machine in muddy, rutty, rough or rocky roads. Has large wheels, solid rubber tires and **rides like a carriage**. The Holsman exclusive patent marks an era in automobile building. It does away with all live axles, friction clutches, differential gears, pumps, etc. Reverses without extra gears. **No water to freeze. No puncture troubles. No odor. New hill climbing power.**

**The Holsman Automobile Co.**

Anything less than absolutely sure ignition should have no place on your car. Here is an ignition system that generates its own current, and is wholly independent of outside assistance.

# Apple Ignition System

*"Self-Sustaining"*

With this outfit, you always have abundant current of highest quality. It's there ready to use, either for starting, running, testing, or reserve, and enough additional for electric lights.

The current is drawn directly from the storage battery, which insures evenness of flow and a quality ideal for ignition purposes. The Storage Battery is kept continually charged by the dynamo which is driven by the engine.

The battery acts as a reservoir, and it is never allowed to deteriorate, either in quantity or quality of current.

There are many points about this interesting system which you would doubtless like to learn more about. Write for our Bulletin C-1. It explains every detail of this complete system.

**THE DAYTON ELECTRICAL MFG. CO.,**  
90, ST. CLAIR STREET, DAYTON, OHIO.

*"Built for Ignition Work."*

The Apple Ignition Dynamo, the most important feature of the Apple Ignition System, is built as well as any dynamo made, no matter of what size or use intended. It is a permanent investment, and will outlast your engine.

WHEN WRITING TO ADVERTISERS PLEASE MENTION THE AUTOMOBILE.

**PROTECT YOUR AUTOMOBILE IMPROVEMENTS WITH SOLID PATENTS.**

We can handle your business properly as we are familiar with all types of Autos, are automobile owners and have had twelve years' practice before the Patent Office. Send sketch of your invention for free report as to patentability. Book "How to Obtain a Patent" and "What to Invent" sent Free.

**Ride Easier, Safer and Faster**

with a

**Hotchkín Anti-Jolt Device**

**YOU** can take your car at full speed safely over the hardest bumps and never feel the throw. There isn't any. The **HOTCHKIN ANTI-JOLT DEVICE** eliminates it—cuts it out. This device isn't a "shock absorber" or set of supplementary springs that make your car ride heavy on smooth roads. It's a shock eliminator that does away with all "come-backs." You can use the lightest springs the manufacturer will put on the car without fear of breaking them, and you will ride easier, safer and faster over rough roads as well as on smooth ones.

The **HOTCHKIN ANTI-JOLT DEVICE** eliminates many of the ignition and poor gasoline feed troubles that resulted from hard riding. Every time your car gets a jolt, you rack the engine, jolt the battery contacts and strain your transmission gear.

This **ANTI-JOLT DEVICE** will save wear and tear on every part of your equipment, lessen the cost of maintenance, give better traction, allow greater speed, save tires, and will carry your car as easily over bumps and "thank-you-ma'ams" at full speed as on an asphalt pavement.

Write for descriptive matter or send to-day for the **HOTCHKIN ANTI-JOLT DEVICE** and try it thirty days at our risk.

# LOZIER

## THE SUPREME TEST OF ENDURANCE

- ¶ In the 24 HOUR RACE at the Philadelphia Point Breeze Track June 28-29, THE LOZIER MOTOR CAR (a 40 H. P. Touring Model) FINISHED FIRST PLACE against cars of 50 and 60 H. P., with a Total of 717 Miles over a heavy, muddy, slippery course that 14 hours of rain DURING THE RUN had rendered worse than the famous NEW YORK TO ALBANY 208 MILE ENDURANCE RUN of June 6, and in which severe test THE LOZIER TOURING CAR won FIRST PLACE and was awarded the TROPHY.
- ¶ Two LOZIER MOTOR CARS entered in the FOUR-DAY SEALED BONNET CONTEST of June 19-22, finished with perfect scores and without adjustment of any kind, each earning a Trophy.
- ¶ AN AVERAGE OF 30 MILES PER HOUR FOR 24 CONSECUTIVE HOURS on a heavy, muddy track such as that of June 28-29, is unquestionably a great record, and the above tests spell ENDURANCE such as only a car of the general excellence of THE LOZIER can guarantee.
- ¶ This Car (No. 519), the winner in all of the above, went into commission on May 28, and HAS WON THREE TROPHIES for the month of June. It returned from the Point Breeze Run without adjustment, and is now doing demonstrating duty in New York. That it is a regular stock car and not specially constructed for races such as the above, is assured in that it is offered at \$5,000, the regular price, to any one. Every car that we build is just like it.
- ¶ We have talked MERIT and ENDURANCE always—they are big assets of THE LOZIER MOTOR CAR.

THE ALLOY THAT MAKES ANTI-FATIGUE STEEL

**Ferro-**  
**VANADIUM**

What the automobile manufacturer wants is a steel that will stand up under vibration. There are plenty of steels with great elastic strength—but they won't stand the terrific strains, the unexpected shocks, the constant vibration to which they are subjected in modern, high-speed automobile construction.

We call Vanadium steel the "Anti-Fatigue" steel because it not only excels all other steels in elastic limit, but it has more life or vitality to it than any other steel that was ever produced.

Cold twist of crankshaft steel.  
Elastic limit 116,000 lbs. per sq. in.

The illustration shown on this page demonstrates the marvelous combination of **great strength and extreme toughness or ductility.**

Vanadium steel is practically unbreakable under any of the conditions of ordinary or extraordinary use. It takes a tremendous pressure to bend it, but it will bend before it will break. It will not deteriorate under vibration. It will not break under sudden or unexpected stress.

It is the only steel to use in any place where the safety of human life depends upon the materials used.

Vanadium Book No. 2 is now ready. Every steel user ought to have it. May we send it to you?

The **WILLET CARBURETER** PAR EXCELLENCE

**THE**  
**CARBURETER**  
for Low Grade Gasoline  
for Two or Four Cycle  
Engines

Easiest Starting Carbureter in the world

A Carbureter you can depend upon—that always gives a perfect mixture regardless of conditions imposed

The superiority of the Willet Carbureter is that instead of a single nozzle there are a series of six small tubes which form individual nozzles fed from the inlet at the bottom. Owing to restricted openings, the air must pass close to the points of the individual nozzles and carry a considerable quantity of gasoline even at slow speeds. A conical shaped valve makes the carbureter very sensitive, and the concentration of air over the individual nozzles gives such a good mixture that the engine can be readily started.

**\$1.40 PREPAID TO ANY ADDRESS IN THE U. S.**

**GIVE A CARE** to your gasoline pipe strainer, as nine times out of ten it is the secret of carburetor troubles. A little water or foreign substance in the gasoline will put your carburetor out of commission. Our strainer is a guarantee against such troubles. It is made from sheet brass, highly polished, and furnished with either 1/4 or 5/16 inch connections. The gasoline enters through the low connection, strains through a chamois placed at an angle across the globe, and passes to the carburetor through the upper connection cleansing the gasoline thoroughly. The foreign substance remains beneath the chamois and may be drained through the petcock. Write today for catalog. Special prices to manufacturers and dealers in quantities.

## The Why of the Duplex Coil

Two cores instead of one means short primary and secondary windings—no loss of energy in the coils—the full voltage being delivered to the

vibrator. They mean 4-times-greater magnetic force—the use of a strong spring and light armature, a quick, hot spark at that point of compression which produces *full force and power*.

"A mile's trial will prove it all." Therefore we make the following offer to you to-day. Don't doubt. Just write.

### 30 Days' Free Trial

We will send the Duplex Coil, express prepaid, to any manufacturer or responsible automobile owner on its merits. Put this coil on any car in place of any other coil on the market, and if, after a reasonable trial, the Duplex Coil does not show greater efficiency, does not give a hotter spark, does not increase the power of your car, does not use less current for a given mileage and is not more generally satisfactory than any coil on the market, remove it from the car and return it to us at our expense, and the test will have cost you nothing.

If the coil bears out our claims, after a most rigorous trial, then pay us the small sum which we ask.

Write us to-day on your business stationery and a Duplex Coil will be sent you at once.

# Save 27 Minutes

The usual time required to replace a  
punctured tire is 30 minutes  
With the

## CRESCENT (Formerly Harburg) Removable Rim

a complete tire change is made  
in 3 minutes, by the watch.

The above sectional view shows the permanent beveled band, fitted to the wheel felloe, the adjustable rim holding any regular make of clincher tire, and the hinged clip, six of which are used to hold the rim in place.

Extra tires and rims are always carried—the tire being inflated at home before starting on a trip.

When a puncture is experienced, the damaged tire with its rim is removed and the extra rim and inflated tire is quickly bolted to the wheel, the entire operation consuming but three minutes.

Nothing could be more simple. Irritating delays are absolutely done away with. All parts are galvanized, nicked or bronzed, thereby preventing any possibility of their rusting tight.

Any regular make of clincher tires fits these rims. Can be used on old or new wheels.

Write to-day for particulars, prices and descriptive circular.

NEW YORK

### On Your Machine—Not On Your Mind

After all, the tire question, provided it has been wisely disposed of at the outset, is a mere incidental one. It assumes an undue prominence only when this precaution has been omitted.

Many good things might be truthfully said about

#### **G & J TIRES**

but they are all summed up in this:—that when your machine is equipped with them you can dismiss the tire question for good.

In case of accident quick and permanent repairs insure an immediate return to the *status quo*.

The Midgley Universal Rim can be used interchangeably for the Dunlop or clincher type. It's no trick at all to take the tire off when you want to.

# REX IGNITER

The King of All Storage Batteries

Particularly adapted for ignition work. The grid is of such a form as to absolutely lock the active material in place and prevent it dropping out when in service. The plates are assembled in celluloid jars, each jar having a separate cover. By the use of separate covers, entirely insulated from one another, the charge is retained for an indefinite period. The connection which extends from the inside of the cells to the outside is of such a design as to reduce corrosion to a minimum. As far as possible brass and nickel parts have been eliminated. All parts are manufactured by the company, thus making it possible to assure the quality of the product with much more certainty than if the work was undertaken by a number of independent firms.

**Longer Life**  
**Efficiency Unsurpassed**

Extract from many motorists'

# DECLARATION OF INDEPENDENCE

When, in the course of motoring events it becomes necessary for certain motorists to dissolve the bands which have unwittingly held them to unnecessary and disquieting tire troubles, a decent respect for the interests of other motorists requires them to publicly declare their *ability* to thus dissolve themselves.

We hold these truths to be self-evident: that all motorists are created more or less equal; that they are entitled to certain inalienable rights; that among these are life, touring, and the pursuit of speed; that to secure the full enjoyment of these rights automobiles have been instituted among men, deriving their right to exist from the matchless pleasure which they afford mankind. That whenever any brand of tire-equipment for such automobiles becomes destructive of these ends, it is the indisputable right of motorists to discontinue it and to substitute in its place an equipment of GOOD tires as the surest guarantee of their continued safety and happiness.

\* \* \* \* \*

We, therefore, as a body of pleasure-seeking motorists, appealing to the sound judgment of other motorists for the rectitude of our intentions, do, in the name and for the promotion of automobiling as an unrivalled sport, declare and publish that, after severe and repeated tests on highways of every possible description, we unhesitatingly advise the use of

**MORGAN & WRIGHT TIRES  
ARE GOOD TIRES**

firmly believing that by the general adoption of this tire-equipment motorists everywhere will be enabled to absolve themselves from all allegiance to tire annoyances, be free and unhampered to enjoy themselves as motorists are entitled to, and to give to touring that most essential requisite, namely, an assurance of protection against the petty disaffections which tires of less inherent strength are known to be heir to.

(Signed by 99 3/10 of all Morgan & Wright tire users.)

O: THAT'S A BULLARD. GO AHEAD.  
WE CAN'T DISPUTE THAT RECORD.

He is not the only man who has saved a fine and annoyance by having this instrument on his car. While a reliable Speedometer is a good thing to have, it would not have protected him, and he would have had to go to the station with the officer and the officer's watch would have won.

### EXTRACT FROM A LETTER RECEIVED FROM A WELL-KNOWN CHICAGO AUTOIST

Chicago, Dec. 18, 1906.

I note that you would like to have a description of the police incident I mentioned to you in New York. It was as follows:

One evening, while going home from the office, at a speed which I felt confident did not exceed the fifteen-mile limit here, I was stopped by a policeman who insisted that I was running too fast, and that I must go to the station with him. I asked him about the time, and though he seemed to think I was scheming to distract his attention, I insisted that he compare his watch with mine. After he had done this, I started to take the recording paper out of the instrument and put the time on the back of it, so I could show at what speed I was running after we got to the police headquarters. He had already gotten into the car to ride over there with me, but after looking at the record-sheet, he stepped down out of the car, telling me "to get out of there with that damn thing."

This was the last time I was stopped; however, I try to keep from exceeding the speed limit.

W. J.

### INCONTROVERTIBLE EVIDENCE!

Equip your car with the "BULLARD" and "LET IT ALONE." Space will permit of facts only. Write for new catalogue giving full information and prices on both the Bullard Speed Recorder (3 in 1) and the Bullard Speedometer.

A STRONG POINT

## In Tire Equipment

☞ A point that stands out boldly in "FISK" tire construction—is the absolute impossibility of accident from tire causes.

☞ It is a "FISK" perfection—and one that cannot be dodged when selecting tire equipment—for safety from tire disaster is an important motoring comfort.

☞ No other tire product has proved 'just as good' as "The Fisk Mechanically Fastened Tires." They are locked to the rim and cannot come off from mishap, whether inflated or deflated. They cannot 'creep' or blow off, but may be removed easily and repaired with dispatch. The inner tube cannot be pinched, nor the tires torn from the rim by 'side roll.'

☞ "FISK" tires will endure every mileage service and show the least wear. They ride delightfully over smooth roads, and with gentle comfort over crude ones. At any speed—you travel safe and secure from tire calamity.

**CENTRAL PENNSYLVANIA AUTOMOBILE COMPANY**  
 GENERAL AGENTS FOR CENTRAL PENNSYLVANIA  
 HIGH GRADE CARS, ELECTRIC, GASOLINE AND STEAM

HARRISBURG, PA., MAY 17, 1907.

Gentlemen:—In our recent Endurance Run, pulled off under the most trying circumstances, the roads being notoriously bad, and the weather worse if possible, we had on the White Steamer, Car No. 6, a valuable demonstration of the advantages of the Q. R. Rims. The time required in repairing our first puncture was not measured accurately, but we repaired the second one, and were again in the race, after four minutes. We next found a ten-penny wire nail driven in clear to the head. In this case, we took the tire off, put in a new tube, inflated it with the air pump of the car, in three minutes by the observer's watch, which we believe was "going some" in this line of work. *Our less fortunate competitors were, in many cases, three times that long in doing the same work.* Some cars in this run suffered as many as eight punctures and blow-outs, which accounts for the many bad scores shown on the Official record, and we considered ourselves fortunate in having Goodrich Q. D. tires.

Yours respectfully,

CENTRAL PA. AUTOMOBILING CO.  
 I. W. DILL.

## Finishing Motor Crank Shafts

By the TINDEL SYSTEM of LATHE and GRINDING MACHINE

THE TINDEL-MORRIS COMPANY  
EDDYSTONE, PENN., U. S. A.

BEYOND all comparison the cheapest way to finish motor crank shafts in quantity from the rough forgings is by the use of the Tindel-Albrecht Lathe for rapidly cutting down the rough forgings to grinding size and finishing in the Tindel-Albrecht Special Crank Shaft Grinding Machine.

Cost of installation of plant is less than any other.

No accessory fixtures are required.

The output is much the largest.

The wear of grinding wheels is trifling.

The accuracy of the work is unequalled.

Write us for particulars.

## Vulcanizing Substitute Cement and Acid Cure Solution

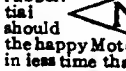

MOTORISTS, as a class, are apt to fall into expensive habits. One of the habits is having his tire or inner tube sent to a repair shop every time he has a blow out or a puncture, which means quite an expense account at the end of the season.

If every motorist would use  Cement and Acid Cure Solution he could reduce his repair bills 75%. For instance an ordinary puncture repaired at the garage or repair shop would cost from \$2 to \$2.50 while with  Cement and Acid Cure Solution the cost of these repairs would not be one-tenth this amount which is a big saving.

 repairs instantly; no waiting; no patch coming off after running 5 or 10 miles, for the repair will be permanent as it produces the same effect as vulcanizing.

 will splice your inner tubes, repair curb cuts on solid tires, attach leather to rubber, retread your tires or unite any grade of rubber.

 Cement and acid is the most essential part of your repair tools, and should always be carried in your Auto. for the happy Motorist is the man that can repair his puncture in less time than it takes to change the tire or inner tube.

 Cement and Acid Cure Solution, 1 pint, \$1.50; 1 quart, \$2.75; 1 gallon, \$8.00.

## A CORK INSERT CLUTCH

FOR COMMERCIAL CARS

The constant starting and stopping of heavily loaded commercial cars on their way through crowded city streets call for high efficiency in both clutch and brakes. This need is fully met by the use of Cork Inserts. They lessen the liability of collision, and eliminate the cutting or wearing of opposite surfaces, thus doing away with the necessity for repairs. Cork Inserts are used in clutches and brakes by 31 leading manufacturers.

Write for full particulars.

## THE RUSHMORE IS WELCOMED

with acclaim in every country where the automobile is known.

A year ago we thought our export business was worth talking about (and it was), but it has increased fourfold since then. In France, where, if anywhere, an American article must sell purely on its merits, we have outgrown our late quarters at 95 Ave. des Champs Elysees, and have taken the entire ground floor of the new fireproof building at 116 Boulevard Péreire, in the new automobile "row" of Paris.

And this in spite of the fact that cheap copies of the Rushmore are almost as numerous in France as at home.

## The Royal "Multiplex" Lamp and Attachment

### SOME FACTS

Nine times out of ten an owner has a storage battery, a Dynamo or a Magneto.

Now, then, why should he carry around with him a cumbersome gas tank, or an explosive generator if he can light his lamps with our

### "Multiplex" Lamp

on his Battery, Dynamo or Magneto.

The "Multiplex" Lamp gives 30 to 32 candle-powers with reflector on 6 volts.

It will burn from 300 to 400 hours and will give a blinding, dazzling light.

No storm can blow it out.

No matches needed.

No leaky hoses to cause trouble.

Light your lamp from the seat.

Tools needed to install: a screw-driver—that's all.

We have now 4, 6, 8, 10 and 12 volt lamps in stock for immediate shipment.

Renewed bulbs, any voltage up to 12, \$1.25.

Complete outfit—1 Bulb, Attachment, 10 foot cable, Snap Switch and directions, \$2.50 (by mail \$2.60).

Double outfits for 2 searchlights or 2 headlights, \$5.00 (by mail, \$5.20).

Ask any Automobile Supply Store or Garage to get it for you, or we will send it by mail.

## The Glory of Automobiling is Tenfold More Delightful if the Car is Equipped with Woodworth Treads

No other device has ever been invented that will give such convenient, reliable and positive protection to the pneumatic tire and the automobile as the Woodworth Tread. Punctures and other tire troubles that cause wayside delays are not only costly, but unnecessary. They can be avoided. The pneumatic tire is made of rubber, a substance too tender to withstand the hard usage to which it is subjected. It cannot last long, however careful the running. *The Woodworth Tread Protects the Pneumatic Tire Precisely as a Shoe Protects the Foot.* It bears all the hard knocks, roughs and scuffs, wear and tear of rocky roads, rutty roads, slippery roads, muddy roads, sandy roads and all kinds of roads. It does more to make the running of an automobile safe and economical than all other devices ever invented for the purpose. It has saved thousands of tires from punctures, prevented thousands of accidents, saved many a car from demolition, saved many a life and may save yours. Write to-day for booklet, "Safe and Sane Automobiling." Sizes and prices are as follows:

26x2	Each	\$ 8.00	28x3½	Each	\$14.00	32x2½	Each	\$14.00	34x3	Each	\$16.00	36x2½	Each	\$16.00

ADDRESS REPLY TO  
MANUFACTURING DEPARTMENT

June 24, 1907.

Holley Bros.,

Detroit, Mich.

Gentlemen:

Our Ford, six-cylinder car, which won the 24 hour race Saturday, breaking all world's records, was equipped with the Holley Magneto. During the entire race it gave no trouble of any nature and we obtained uniformly satisfactory results.

Yours truly,

FORD MOTOR COMPANY.

*Henry Ford*  
President.

The above letter is self-explanatory. The Ford Car which won the 24-hour race in Detroit, Saturday, June 22d, was equipped with a Holley Magneto. During the entire race the magneto was in constant use. The battery was never used, and the magneto was not repaired or adjusted in any manner whatever. A severe test like this in public proves conclusively that the Holley Magneto is not equalled by any ignition device in the world. Several of the contesting cars were equipped with foreign-made magnetos.

# Aerocar

## Did you hear about it? —the Model "F" ?

Our big forty-horsepower, water-cooled car—The car that will start on the high gear from almost anywhere—The machine that will run uphill the same as on the level—The car that is selling where foreign-built cars have sold heretofore? Did you?

For four days it ran without touching a part. 600 miles were covered and everything sealed. The gasoline and oil were replenished—the crank given a turn—and day after day it covered the course, making every control on exact time.

The official starter had placed his seal upon everything that would open. Not only the bonnet—but the coil box—the transmission—the springs—the wheels—yes, and even the tool box itself.

But it made no difference with Model "F." It is not accustomed to stopping along the road. Adjustments are seldom necessary. It is "Built for Service," and it gives it.

If you want a handsome—reliable—powerful—easy riding Touring Car—and want to save about \$1,200, ask about Model "F" at \$2,750.

### POINTS TO THINK TWICE ABOUT

- Four-cylinder vertical motor.
- 5-inch bore, 5-inch stroke.
- 40 horsepower.
- Water cooled.
- Jump spark ignition with storage battery, and auxiliary dry cells.
- Float feed carburetor.
- Automatic mechanical oiler.
- Spark and throttle levers on steering wheel.
- Multiple disc clutch.
- Sliding-gear transmission, with 3 speeds forward and reverse.
- Horizontal shaft drive.
- 11 1/2-inch wheel base.
- 4 x 34 inch tires.
- Seats five persons.
- Royal Blue finish with "Cream" gear.
- Black leather upholstery.
- \$2,750 f.o.b. Detroit.

**As Standard  
as a Gold Coin**

The makers of the **DRAGON**—Touring Car and Roadster—have no hankering after novelty for novelty's sake alone. They started out to make a standard car. The present demand for their product shows how the public appreciates the **standard** idea.

The **DRAGON** is a unit car. Each part of it is designed and constructed in relation to every other part. [And every part is a tried and tested feature of standard automobile practice and construction.

This is why the **DRAGON**—Touring Car and Roadster—finishes in the high-powered, high-priced class in every contest it goes into.

This is why the **DRAGON** moves smoothly and silently along, mile after mile, day in and day out, and makes a **DRAGON** enthusiast of every man who buys one.

This is why the **DRAGON** sells so easily. The man can see it's what he wants—a simple, strong, full-powered, reliable car.

## OIL-GREASE GUNS

PUTS THE LUBRICANT WHERE YOU WANT IT AND IN THE EXACT QUANTITY WANTED

**EFFECTIVE - ECONOMICAL - PRACTICAL**

Absolutely Non Leakable  
Never Wears Out—ALL METAL  
No Washers of Any Kind

They are of the finest workmanship, perfectly adapted to handle lubricants of every description, and are constructed on lines heretofore considered impossible. The fitting of the pistons without leather, cork or other packing, the easy one-hand manipulation, and the absence of leakage, never fail to surprise the examiner and give pleasure to the operator.

### The Boston Combination

Will handle the most solid lubricants in use as readily as it will the lighter ones.

Lock nut moves freely with piston unless engaged by thread. In this position the piston is driven forward by screw motion and exerts a pressure that will handle the heaviest greases.

The Handy Gun FOR Unhandy Places

OIL CUPS, GEAR BOXES and TRANSMISSIONS REACHED WITHOUT THE WASTE OF A SINGLE DROP.

**MECHANICALLY PERFECT!**

"We want to say right here that we never saw anything so well made before. We showed them to our mechanics, they consider the fit of the piston as something wonderful"

# The Victorious, Great Chadwick SIX

FOR months we have been advertising this fact in the leading automobile publications, and in the greatest hill-climb America has ever known—up Giant's Despair Mountain, Wilkes Barre, Decoration Day, all our claims were conclusively proved to be correct, for the Great Chadwick Six met and defeated all comers, and so complete was the victory that the other cars (foreign and American) in the race could justly be termed "also rans."

WE entered but one car, which was our regular demonstrating automobile and which is for sale to anyone. We made no special preparations and we won the two most important touring car events and made the fastest time on this hill that has ever been made by a gasoline touring car. We took this same touring car and entered it in the free-for-all, against Vanderbilt Cup Racers, and finished only three seconds behind two specially built machines, which are not stock cars nor sold to the public.

IT was universally conceded by everyone that the CHADWICK made by far the most wonderful performance at the hill-climb, because notwithstanding its terrific power and speed, it ran quietly and easily. Remember, this very car that won this record is for sale, at the regular list price, or if you prefer, its duplicate, because it is not a specially built machine, but one of our regular stock, 1908 modeled.

The above is from a photograph of identical victorious Great Chadwick Six.

	TIME	H.P.	COST
<b>Ninth Event</b>			
Great Chadwick Six . . . . .	2.02 2-5	50	\$5500
Thomas Special . . . . .	2.05 2-5	60	?
Stearns . . . . .	Did not finish		
<b>Tenth Event</b>			
Great Chadwick Six . . . . .	2.07	50	\$5500
Matheson . . . . .	2.19	60	\$7500
Matheson . . . . .	2.24 4-5	50	\$5000
Fiat . . . . .	2.35 4-5	35	\$9000

**FREE FOR ALL**

Matheson Vanderbilt Cup racer specially geared, only three seconds under time made by the Chadwick Stock Touring Car with standard gear.

A ride in the Great Chadwick Six will demonstrate that a new field of motoring pleasure awaits you.

# The Springfield Motometer

“The Speedometer that has proved it”

Unless a speedometer is *accurate* and *stays accurate*, it is *worthless*.  
 To *be* and *remain accurate* is its *whole duty*.  
 Every buyer has a right to demand *proof*. Anyone can *claim it*.

If you *see* with your own eyes an *indisputable* demonstration of accuracy—holding the watch and counting the revolutions *yourself*, not on *one* but on *three* Motometers *simultaneously*—that is *proof*.

If, back of this, there is *reputation*, gained by *seasons of sale* and *use* under all conditions—that is also *proof*. We offer *both kinds*. The first at *all the big shows*—the second *every day* and at *all the time*.

Do you want a speedometer that you can *know* is right? Then specify the “*Springfield Motometer*.”

## THE PRICE IS RIGHT

Costs *less* than any other speedometer *with a reputation*.

Costs *no more* than the experiments.  
 For any car made, complete with fittings

# The Veeder TACHODOMETER

Is the Scientist's Speed Indicator, applied to automobiles. Used in the greatest laboratories and shops, time-tried, reliable, and now fitted for automobile use.

One shaft with paddle-wheel permanently attached forms the SINGLE moving part. Gravity and centrifugal force are the only other elements of control. Until these natural laws change the Veeder Tachodometer must remain *permanently and absolutely accurate*.

Of the many principles on which speed indicators may be designed we have chosen the liquid centrifugal, and the results are so satisfactory and so positively accurate that this system rises

**SUPERIOR TO ALL OTHERS**  
Because there are NO SPRINGS NOR VARIABLE ELEMENTS

NO DELICATE MECHANISM.

ONLY ONE MOVING PART.

CAN BE ACCURATELY SET TO ZERO by the operator at any time. No other can.

IT IS PRACTICALLY IMPOSSIBLE TO WEAR IT OUT.

NEITHER TIME, USE, FRICTION NOR TEMPERATURE CAN CHANGE ITS ABSOLUTELY ACCURATE READINGS.

IT DOES NOT SWING NOR WOBBLE, but follows exactly and instantly every slightest variation of speed.

SHOWS SPEED FROM ZERO TO 62 MILES PER HOUR.

CAN BE READ FROM A DISTANCE AT A GLANCE.

CAN BE PLACED ON DASH, IN TONNEAU, or in LIMOUSINE.

REGISTERS TOTAL DISTANCE, AND FOR EACH TRIP.

No instrument in which springs are employed (and practically all other speed indicators contain springs) vary with age, temperature, and especially with the friction of moving parts; and only by special lubrication, not found in the ones you buy, can correct readings be obtained even for a short time.

Supplied with attaching fixtures for all makes of automobiles. In ordering state make and model of car; also year of manufacture.

PRICE, COMPLETE, READY TO GO ON ANY CAR. \$75

WHAT IS BEING DONE BY THE

# Wayne

In the 24-hour endurance contest held at the State Fair Grounds, Detroit, Michigan, on June 21st and 22nd, under the sanction of the A. A. A., the Model N Wayne beat the World's Record by 132 miles, the Wayne's total mileage for the 24 hours being 958 miles against the old World's Record of 826.

On the same date, June 22d, in the 100 mile endurance contest held by the Detroit Automobile Club, the Model N Wayne Roadster, driven by Mr. Geo. Lane, FINISHED WITH THE ONLY PERFECT SCORE IN ITS CLASS. Only two other cars, both of them in a different class and considerably higher priced, finished with a perfect score.

JEWEL argument is not a matter of superlatives nor extravagant, boastful claims. It is based upon these definite points:

There is no other gasoline car that is so easily controlled.

There is no other gasoline motor so simple.

There is no other gasoline car that costs so little for repairs and maintenance expense.

Let us give you the whole story of JEWEL construction and equipment in our free booklet. It fully describes the JEWEL Valveless, Two-cycle engine, and shows why experience, rather than advertising, has made the JEWEL famous.

# DIAMOND Automobile CHAINS

operate smoothly even when hard driven under bad conditions. The hardened nickel steel rivets won't crack or break under the heaviest load, and their bearings are so uniformly tempered that no serious wear results when dirt and grit finds its way in. The elasticity of the special steel side bars prevents permanent stretch from sudden jerks, and when **Diamond Chains** are used as we advise, the pitch will not elongate enough to impair their action.

Diamond Chains were first put before the public seventeen years ago, when we originated the machined chain industry. They have since been proved, tested, improved and re-tested by actual service, until their superiority is generally conceded. They may be found on representative cars everywhere, and are made in every size. When your old chain is worn out replace it with a Diamond. Kept in stock by all jobbers.

Write for instructive book on Chain Power Transmission. Free if you mention this paper.

**THE DIAMOND CHAIN & MFG. CO.**

# KNOX

## 2 KNOX WATERLESS 2 PERFECT SCORES

In the four-day reliability test held June 12-15 by the Automobile Club of America, the best and fairest contest ever conducted in the automobile industry. The bonnets and all mechanism were sealed, no adjustments were permitted, and on the Knox cars, none were necessary. The minimum run was 150 miles in one day. Both of the participating Knox cars were stock models, one has been in daily use as a demonstrator for six months, the other for three months. Both were run to New York the day prior to the contest, and back to Springfield the day after.

### IS ANY BETTER TEST OF KNOX RELIABILITY POSSIBLE OR NECESSARY?

Every Model "H" Knox will do as good work, and do it not only for six consecutive days, but for 365 consecutive days, and then some more. We do not build special cars, and every Model "H" is the same as every other Model "H," except in the color of the paint. Knox construction is right, and what is more important, stays right.

Illustrated catalogue is yours for the asking. Better get acquainted with the best car for the price of the year.

## GET READY FOR

# 1908

The sale for Cadillac cars has always been so great that our factory has never been able to fully meet the demand and we have, therefore, not been in a position to take on many new dealers.

We have, however, recently enlarged our manufacturing facilities and shall be in a position to make arrangements with a limited number of new dealers in unoccupied territory.

It is not necessary here to go into details about Cadillac cars. They are the most popular and easiest cars in the world to sell. Their unequalled dependability and economy of operation and maintenance is so universally known that the Cadillac usually receives the first consideration of a prospective purchaser, the question being whether he could get one.

If you are an automobile dealer or expect to take up the business, your success depends upon handling cars that give satisfaction and that you can sell in increased quantities year after year.

Cadillac dealers as a rule are the most successful dealers because they can sell more of them than any other and because it takes less effort and less expense to sell a Cadillac.

The line is in part as follows:

10 H. P. Runabout . . . . .	\$ 800.00
10 H. P. Four-Passenger Car . . . . .	950.00
10 H. P. Enclosed Coupé . . . . .	1,350.00
20 H. P. Four-Cylinder Runabout or Touring Car . . . . .	2,000.00
30 H. P. Four-Cylinder Touring Car . . . . .	2,500.00

Now is the time to get ready for 1908 by selling some Cadillacs this fall and getting trade started which no other car can take away from you.

# Cadillac

# The American Tourist

"NO NOISE BUT THE WIND"

Price, \$3250 F. O. B.  
Indianapolis.

## Satisfies the Idealist

Define your own ideal of touring car perfection and note how ably the American Tourist meets it.

For a car of its size, elegance and comfortable capacity it is comparatively light (2,600 pounds). Large wheels, drop frame and special spring arrangement insure ease of motion and a welcome relief from tire troubles.

Its powerful engine (four cylinder, 5x5, rated very conservatively at 40) insures reserve energy for all occasions.

## A Car of Thorough Design

Special features provide for perfect control at all speeds, and freedom from engine or other mechanical troubles. And yet its construction is extremely simple.

Combine all this with its excellence of materials, careful hand workmanship, and beauty of appearance, and you will find the American Tourist much to your liking.

**Have You Seen the American Roadster?  
The Sportiest Thing on the Road!**

# Matheson

**T**WO Matheson cars add perfect scores in the 4-day Sealed Bonnet Contest to the long list of Matheson performances.

Mr. R. G. Kelsey, an Amateur, drove his 1906 Matheson throughout this contest with no more need for an adjustment than on the famous trips to Chicago and Boston which he made with this same car and on which he made the best time of the year under the frightful road conditions. This in spite of the fact that the rules obliged Mr. Kelsey to make 25 miles a day more than any other car except one of a famous European make.

This performance means but little in itself, but coming as it does—so close on the other Matheson victories—the new record for gasoline cars made in the hill-climb up "Giant's Despair" and the perfect scores in other endurance runs on Decoration Day—it tells a story eloquent of Matheson reliability in any event—under all conditions.

No car in the world—not the greatest of the foreign cars—can equal the Matheson in service over American roads. The Matheson will carry seven people seventy miles an hour. You cannot purchase a more beautiful and luxurious car.

# Smith Tourists' Companion

The "Tourists' Companion" (type No. 9), one of the finest products of the great English instrument and watch makers, S. Smith & Son, Ltd., combines in one handsome fixture:

1. **The Smith Perfect Speed Indicator:** The only speedometer on the market which is exactly accurate for every speed. The unique three-spring construction and the individual hand-marked dial make it possible.

2. **Barometer:** It will foretell rain before the sky does.

3. **Trip Odometer:** 100-mile limit. Turning a button returns it to 00 whenever desired.

4. **Season Odometer:** For registering totals up to 10,000 miles.

5. **Compass:** Balanced on universal joint. Makes the road maps intelligible and saves errors.

6. **Eight-Day Clock:** Our well-known workmanship. Accurate and absolutely vibration-proof. Extra at small additional expense: A "maximum hand" on the Speedometer. It saves arrest and prevents unauthorized use of car.

In ordering, always specify in full "S. Smith & Son Tourists' Companion."

Full instructions for applying sent with every instrument.

Ask your accessories dealer for particulars, or write directly to us for large catalogue of speedometers, odometers, combination attachments, clocks, compasses, head and side lights, horns, and other interesting and convenient automobile fixtures. Mailed free to any automobilist.

**S. SMITH & SON, Ltd., 116 Broad Street, New York**

To Dealers: Write for our terms to the trade. We want good representatives at once in every city and town in the United States. Our line is of the very best grade and can be handled with perfect confidence. Send for particulars.

## John Boyle & Co.'s TRUNKS

Need small comment as far as reputation for QUALITY, SERVICE, DURABILITY and STYLE goes.—Select any one of the shapes for the various makes of cars and you are assured of the highest quality. Like everything else that's good, however, there are imitations. Be careful in your choice. Buying a trunk without a reputation is like spinning a coin, a "hit or miss" proposition.

**No Trunks will give such satisfaction as those made by JOHN BOYLE & CO.**

A letter asking for particulars and prices will bring proof aplenty.

## The VICTORIOUS

# Darracq

"The Fastest Car in the World"

### DARRACQS DE LUXE

¶ Any maker can add two cylinders to his engine and announce that he has produced a six-cylinder car, but a true six-cylinder car means more than that. A six-cylinder engine has problems that are all its own, not to be solved by a simple extension of four-cylinder principles.

¶ But the Darracq for 1907 is a real six-cylinder car—one of the very few on the market. Unique devices have been developed to answer properly the unique needs of this form of engine. Novelties in design have fulfilled the necessities of novel principles.

¶ Almost alone of Automobile builders, Darracq et Cie are ready to declare that their six-cylinder model is as perfect and complete to the uttermost detail as their standard four-cylinder cars.

¶ Equipped with the finest bodies of every style, the 1907 six-cylinder Darracqs de Luxe are recognized by every expert who sees them in our salesrooms as the summit of achievement in the automobile industry.

¶ We have several of these cars for immediate delivery; also the well-known standard four-cylinder cars with open or closed bodies.

Delivery guaranteed within three days of receipt of order.

**Elmore**  
Valveless 2-Cycle

Where's the Power Gone That I Bought  
With This Expensive Car?

Three-Cylinder, \$1,750. Four-Cylinder, \$2,500.

That's the question the owner of a costly four-cycle car asks himself after the first year of his purchase.

Perhaps the car was as well built as it could be—but the principle was wrong.

There's a difference between the intermittent, spasmodic power of the four-cycle car and the rhythmic, steady, continuous power of the two-cycle Elmore.

Yes—and there's a difference between the cost of upkeep of the four-cycle car with valves and the two-cycle Elmore which has no valves.

Yes—and there are a dozen other differences—all of which you should learn about before you buy any car.

Our booklet, "Our Daily Mail," tells most of them—get it.

# Stoddard-Dayton

**SIX CYLINDERS  
ALL IN ACTION**

Model 8G, the Six-Cylinder Stoddard-Dayton, has proved the most delightful surprise of the year. If YOU want a powerful touring machine not as heavy as a freight car and built on modern lines with just enough hood to give it graceful proportions, Model 8G will fill the bill of particulars.

It embodies all the points of excellence which have proved factors in the success of every Stoddard-Dayton—the cars that have ALL made good. Perfection in construction has been attained in Model G, for

## Every One of the Six Cylinders Work Regularly

instead of several getting in an occasional spasmodic explosion. Bosch High-Tension Magneto and jump spark with sextuple coil and storage battery give two complete systems of ignition.

Stoddard-Dayton Six Cylinder is a roomy car, big enough to comfortably seat seven large people. The extra seats are of the disappearing type—out of the way when not in use.

A powerful car, riding like a baby carriage, as easily controlled as a runabout and combining strength, silence, simplicity, beauty, elegance, comfort and luxury.

Model 8G—a seven-passenger, Six-Cylinder Touring Car. Cylinders cast in pairs, 4 5-8 x 5 inches. 50-60 H. P. Transmission—selective, sliding gear type—three speeds forward and reverse. Price, fully equipped, \$4,500.00.

Let us send you full description of this Modern Car—the BEST in its class.

# HAYNES

## The New Semi-Racer Proves Itself

After it had been on the market less than a month the new Haynes Semi-Racer won its first competitive test in the 200 Mile Endurance Run of the New York Motor Club, June 6th. Over roads which recent rains had put in horrible condition, under conditions that required an average of 20 miles an hour, a very high average for touring, this Haynes Runabout won in its class. It reached its destination at Albany ahead of time, and in fact through a mistake of the timing was permitted to cross the line too early and was penalized. Experienced drivers said that the run was the hardest endurance test which had ever been held in this country for stock cars.

The Haynes led all the cars during most of the race, beating the high powered touring cars at most of the controls.

The chassis of this car is the same as our Model "S" touring car with all the improved and advanced features which have made our 1907 models famous. It has the patented roller pinion and sprocket direct drive, solving satisfactorily the old problems of rear-axle strains.

It is impossible for the driver to injure the car by careless or rough handling, because the master clutch cannot be made to take hold otherwise than softly, and the exclusive transmission control allows change of gear without releasing the clutch by a single movement of the hand with no possibility of burring or stripping the cogs. The Haynes positive cooling system makes overheating unknown.

Unlimited speed, perfect comfort, a silent engine and transmission, a snappy style, and a name that is thirteen years old—these are what can be had in this new semi-racer.

No one can doubt the supremacy in its class of "the latest model from the oldest maker." Price \$2,500.

### OTHER MODELS:

Model "T," the Vanderbilt Cup Racer Chassis, 50 H.P. Touring Car, seating 7, \$3,500.

Model "S," 30 H.P. Touring Car, seating 5, \$2,500.

Both of *The* "Maxwell" Cars

entered in the "Sealed Bonnet" Contest made Perfect scores

One was the 12-14 H. P. Tourabout shown above, and the other a 5-Passenger 16-20 H. P. Touring Car—both of them ordinary stock cars.

Although the "Maxwell" was by no means the only car to finish this peculiarly exacting test with a perfect score, I want to call your especial attention to the fact that this "Maxwell" Tourabout, costing only \$825.00, and the touring car, costing only \$1,450.00, performed every bit as well as the successful cars which cost three and four times as much.

The "Maxwell" also swept the entire field of light cars at the great Wilkes-Barre and Bridgeport hill climbs.

The "Maxwell" holds the 3,000 mile non-stop record of the world, won the Deming Trophy in the Glidden Tour of 1906, and has won endurance contest after contest.

Be sure to address Dept. 3 for complete "Maxwell" literature, and write me for a demonstration of the "Maxwell."

# The Incomparable WHITE THE CAR FOR SERVICE

## WHITE RELIABILITY DEMONSTRATED ON THREE CONTINENTS

In **AMERICA**, perfect scores were made by the two 30 H. P. White Steamers entered in the 600-mile Sealed Bonnet Contest of the Automobile Club of America. Both cars finished in perfect condition and were ready for several more contests of the kind.

In **EUROPE**, a 30 H. P. White Steamer recently completed an 1871-mile non-stop run from London to Glasgow, then over the route of the Scottish Reliability Contest, and back to London. This trip was made under the surveillance of an official observer appointed by the Royal Automobile Club.

In **ASIA**, White Steamers were selected by the Punjab Motor Transport Company, after severe competitive tests in which the leading makes of the world took part. Low cost of up-keep, supreme reliability, and suitability for continuous 'bus service in a mountainous country, where there are practically no repair facilities, were the factors which determined the choice. Ten White cars have just been placed in service by this company.

## READ THIS LETTER — IT'S INTERESTING

MR. E. P. CHALFANT, Sales Manager,  
Waltham Mfg. Co., Waltham, Mass.

CHICAGO, ILL., June 8, 1907.

*Dear Sir:*—Since receiving the two-cylinder Model BR I have not had an opportunity to take it over the country roads until last Sunday. This was due to the fearful weather, which has been continuous with us for quite a long time; however, last Sunday showed up pretty nice and I drove the car to Sandwich, Illinois, visiting several towns between here and there, and gave a good many exhibitions as to hill climbing, etc. From the time that I left Chicago until I returned, the tool box was never opened, not a single adjustment of any description was made on the engine, and for the first time in the history of my automobile experience my hands were perfectly clean, and I stepped out of the car in Sandwich, Illinois, just as clean as I stepped into it in Chicago. For speed, great power on the hills and quiet running, I believe that Model BR excels all other cars, regardless of price.

Between this city and Aurora we met many cars. We met no car that passed us nor was there any car close to us when we reached Aurora. At no time during the trip did I use the full power of the engine, nor anywhere near its full power, and it is certainly a very satisfying feeling to know that you have so much power in reserve. The absolute quietness of the engine is not only a revelation to everyone who rides in the car, but it was a revelation to myself. Between Bristol and Sandwich is quite a country for game, and there were a great many rabbits on the road. The quietness of the car can be imagined when on two or three occasions we got mixed up with the rabbits. They simply did not hear us coming.

On the road to Aurora between Downers Grove and Naperville is the old Snake Hill, the terror of bicycle riders in past days. This hill staggers a great number of good cars. This was where I wanted to fully test the power of Model BR. I went up that hill three times faster than I ever before went in a car. I only pulled back one notch on the transmission, and the car simply rushed ahead. Our odometer showed 173 miles, and when I stepped out of the car I felt as if I had not ridden 20 miles. There is absolutely no engine vibration of any description and the springs are very flexible, giving that easy motion over the country roads which is never tiresome. You will hear from me again on this subject after the Reliability Contest, which takes place here the latter part of this month. This car cannot help being widely known before the season is half over, as it can more than hold its own against any car on any road.

Very truly yours,  
(Signed) J. H. TOOLE.

PARK DRIVE, WILMINGTON, DEL., MADE DUSTLESS WITH TARVIA

## THE DUST PROBLEM SOLVED

The problem of suppressing road dust is now receiving the attention of the best engineers and road makers in all civilized countries. The suppression of this nuisance has become a necessity, for not only does it damage crops and decrease real estate values, but it is a menace to health itself.

Various methods have been tried for suppressing dust, including sprinkling roads with fresh water, treating them with calcium chloride, impregnating the road surfaces with crude oils of various kinds, etc., but all of these methods have fallen short of their purpose.

Within the past two years, following some experiments by French engineers, this company introduced Tarvia, a special tar preparation. The results from this treatment have been unusually successful. Some 800,000 yards of macadam roads were treated in about thirty different cities. This included work at Jackson, Tenn., under the supervision of the United States Department of Agriculture and work on New York roads under the supervision of the State Boards. It was absolutely demonstrated that Tarvia not only suppresses dust but adds materially to the durability of the road. It has been estimated that its use reduces the wear on the road itself about one-half, and in this way the treatment practically pays for itself.

To anyone interested we will gladly send booklet showing numerous roads which have been treated, with full data covering the subject.

## These Are The Facts

### About the Long Island Automobile Club's Endurance Test:

Five cars, costing \$3,500 or more, made perfect scores in the original run of 200 miles in two days. These five participated in a second 200-mile run in one day. The course was over the worst possible roads and highest hills, part of it being like a ploughed field and part of deep sand. Two cars—a 40 H.P. and a 50 H.P.—fell by the wayside. The Winton Model M and two other cars costing more money made perfect scores.

Chas. A. Carlson, who drove the Winton, says:

"This record justifies my faith that there isn't a car in America at any price that can do better work than the Model M Winton. This particular car ran 6,000 miles before starting in the test, and was not especially prepared for the contest. Indeed, I have hardly looked into the motor since I bought the car last November. It went through both contests without a skip."

40 H.P., Model M, - \$3,500.  
30 H.P., Type X-I-V, \$2,500.  
In Runabout bodies at the same prices. Limousines \$1000 higher.

# THE AUTOMOBILE

the session concluded. In the evening the rooms of the Cleveland Automobile Club in the Hollenden Hotel were crowded to suffocation and not a few failed to woo Morpheus until an early hour this morning. Statistics of the tour give 47 touring cars as competing for the Glidden Trophy, with these clubs represented: New York Motor Club, 11; Cleveland Automobile Club, 9; Chicago Automobile Club, 9; Automobile Club of Buffalo, 5; Pittsburg Automobile Club, 4; Automobile Club of America, 4; Detroit Automobile Club, 4; Westchester Motor Club, 3. There are 14 more touring cars which figure as non-contestants. For the Hower Trophy 13 runabouts are competing, with two runabouts not engaged. Five press and officials' cars bring the total to 81 registered cars, but a score of free lances will be more or less in evidence nearly all the way.

CLEVELAND, O., July 10.—They're on their way—first to Toledo, next to South Bend and then to Chicago—where a two-day rest intervenes before the auto cavalcade will turn about face and start homeward, for the Big Town is home to the whole country at some time during the year, and everyone wants to take a walk along Broadway. It is mighty kind of the Chicagoans to insist upon entertaining in their enthusiastic way, but since many of us have a "show week" near Lake Michigan and—it seems ungenerous to say it—in the pall of smoke which seldom lifts its smutty face we might yearn to continue on our way, Saturday at least and arrive one day sooner at the Jersey City ferry.

Headquarters for the tour have been in the Hollenden Hotel for several days and Chairman F. B. Hower, nervously conscientious, and Secretary Dai Lewis, complacently industrious, accomplished wonders in the final hours of preparation. Numbers and pennants were distributed, rules supplied, hotel applications filed, questions innumerable asked and answered, and finally even the late and noisy ones sought a few hours' rest before the coming of the dawn and its early bestirring in order that "No. 1," an Apperson, driven by the determined yet kindly countenanced Van Sicklen, at 7 o'clock sharp should take to the confetti trail that had been begun as soon as Old Sol showed his ruddy features above the eastern horizon.

Chairman Hower called all the contestants together Tuesday afternoon for final instructions and little was left undone when

About a hundred cars and 500 people will create some excitement along the route. Trophy donor Glidden is riding in the same car with Chairman Hower, who did not leave until after all the contestants had been sent away. Several of the cars are adding to their quest for honors by endeavoring to complete the run with sealed bonnets. No. 51 Elmore and No. 39 Berliet are in this class. Extra parts carried are scanty and seldom aggregate over \$10 in value. The committee did not give out this information in detail, but will do so later in the tour. In two cars, No. 3 Pierce and No. 19 Premier, surgeons are passengers, but it is hoped that their services will not be required.

#### Schedule of the Long Tour.

The first day's run to Toledo consists of a stretch of 121 miles, at the end of which the tourists will have an opportunity to compare their experience of past years with the working of the present arrangements for hotel accommodations, the entire charge of which has been turned over to professionals well equipped to give every satisfaction—Thomas Cook & Sons. An experienced advance man in the employ of that firm will precede the tourists and will make all assignments for the occupants of every car, of which he constantly carries a list, the finishing touches to each day's arrangements being made by getting into communication with the executive committee by long-distance 'phone.

As the test is one for touring cars and runabouts under actual

FORTY MILES OUT FROM SOUTH BEND, INDIANA.

touring conditions, the committee deemed it only proper that each tourist should carry his own impedimenta of this kind and so that no provision for an official baggage wagon was made.

The second day's run is to be to South Bend, Ind., a little over 166 miles, and the third day will be slightly more than a century into Chicago, where the Windy City autoists have been making great preparations for the entertainment of the tourists.

The complete route of the tour is as follows:

Date	Route	Miles	Hotel
July 10	Cleveland to Toledo, O.....	121.0	Boody House
" 11	Toledo to South Bend, Ind.....	166.3	Oliver Hotel
" 12	South Bend to Chicago.....	101.1	Auditorium Annex

		1,570	

**How the Trophy Contestants Will Be Scored.**

Some idea of the severity of the conditions under which the cars are to compete may be gleaned from the following excerpts from the rules. For instance, Rule 3 of "Touring Conditions" reads:

"No replacements, replenishments, adjustments, repairs or inspection shall be made upon the car after the same shall have been registered at any night stop of the tour and before it shall

be registered out the next succeeding morning. No replacements (except tires) shall be made with parts not inventoried and carried at the start, and if replacements except as above specified are made, the entrant may continue the tour, but not as a contestant. Each entrant may carry as many tires as desired."

This provision was chiefly aimed at the charge made in previous tours that some of the cars were rebuilt between daylight and dawn at many of the stops to enable them to continue the next day. In other words, it means that cars must do the entire distance with no other adjustments than can be made without difficulty, or risk of being penalized, on the running schedule, and also without making other than the most ordinary replacements, all of which must be carried on the car and not added to, as provided by Rule 9, which calls for an inventory of all parts carried previous to the start. It reads as follows:

"Each entrant must furnish an inventory, previous to the start, of all the extra parts carried in his car, and the same shall be put in the records."

Rule II also deals with this point in the following manner:

"A statement must be made by the operator and attested by each occupant of the car at the conclusion of each day's run, naming new parts put on the car and repairs or adjustments, if any, made; and failure to do so, fully and correctly, shall disqualify."

But owing to the impossibility of framing any code of regulations that would satisfactorily eliminate all but one or two cars from the running for first place by the time the end of the tour was reached, it was decided in framing the rules to award the Glidden Trophy to a club, instead of an individual, as previously, though the performance of each car is to be carefully recorded and each successful competitor will receive an award in the shape of a certificate, this being provided for by Rule 6, as follows:

"The Glidden Trophy will be awarded to a club, but the score of each car will be recorded daily during the tour, and at the finish of the contest, each entrant, unless previously disqualified, will receive a certificate in accordance therewith."

An objection was raised, however, to permitting high-powered runabouts to compete on the same basis as touring cars, and, to overcome this, the Hower Trophy of a bronze statue was offered, the rule of the touring conditions covering this point merely stating that "The Hower Trophy will be awarded to the entrant whose car shall have the most points to its credit at the finish."

Each team entered for the Glidden Trophy will start with 1,000 points to its credit, regardless of the number of cars composing it, as formerly provided, instead of 1,000 for a three-car team and 1,280 for a ten-car team, a sliding schedule having been devised to maintain the contestants on the same equal footing in the matter of penalization.

Club of	Initial Credit	Penalization per minute or fraction thereof in excess of two minutes at controls.	Penalization per dollar or fraction thereof of value of parts as per manufacturers' price list.
3 cars	1,000	1-3 point	1-3 point
4 "	"	1-4 "	1-4 "
5 "	"	1-5 "	1-5 "
6 "	"	1-6 "	1-6 "
7 "	"	1-7 "	1-7 "
8 "	"	1-8 "	1-8 "
9 "	"	1-9 "	1-9 "
10 "	"	1-10 "	1-10 "

**Previous Tours of the A. A. A.**

The first annual tour of the American Automobile Association, starting July 25, 1904, had as its objective point St. Louis, where the Louisiana Purchase Exposition was being held. Sixteen machines started from New York and joined themselves to eleven others from various New England towns. The ranks of the travelers were swelled by additions from all points, continuing by way of Albany, Utica, Syracuse, Rochester, Buffalo, Erie, Cleveland, Toledo, South Bend, Chicago, Pontiac (Ill.), Springfield (Ill.) to St. Louis. At the same time another portion of the tour was being run over the National Highway and through Columbus, Indianapolis and Terre Haute to the Exhibition City, bringing the total number of participants to 108. 119	J. W. Moore	Moore	40	Automobile Club of America

ON THE A. A. A. TOUR—AN INCIDENT OF WHAT WILL.

the machines reached St. Louis, the tour being more of the nature of a combined run than a competition.

Thirty-two automobiles competed in the 870-mile A. A. A. tour in 1905, the first contest for the Charles J. Glidden touring trophy. Starting from New York, the itinerary was through Hartford, Boston and Plymouth, N. H., to Bretton Woods, and returning by way of Concord, Worcester and Lenox, Mass., to New York. Percy P. Pierce was awarded the trophy. Others finishing with clean scores were Ezra H. Fitch (White), Ralph Coburn (Maxwell), S. B. Stevens (Darracq) and J. C. Kerrison (Cadillac).

No official observers were carried, the contestants as a whole observing the performance of the competing cars, and at the end of the tour voting for the three entrants whose cars, in their opinion, had made the best records. In addition, the Glidden commission employed a formula which took price, equipment and general touring conditions into consideration in awarding the trophy. First class certificates were given to twenty-two contestants who completed the tour and arrived at all night controls before the official closing time. Four second class certificates were awarded to others who completed the tour but failed to make one or more of the controls on time.

Last year's event, the third annual A. A. A. tour and the second competition for the Glidden trophy, was a 1,200-mile run from Buffalo to Bretton Woods, N. H., by way of Utica, Saratoga, Elizabethtown, Lake Champlain, Montreal, Quebec, Jackman and Rangeley, Me. Forty-eight machines started, 13 secured perfect scores, 19 completed the journey with a greater or less number of penalizations, and 20 retired at various points on the journey. Of the six cars competing for the Deming

ABANDONED CHARCOAL OVENS NEAR PITTSBURG, PA.

trophy two obtained perfect scores and four were penalized. The trophy was awarded to C. W. Kelsey, driving a Maxwell.

The 13 with perfect scores for the Glidden Trophy were: Percy P. Pierce (Pierce), A. E. Hughes (Pierce), P. S. Flinn (Pierce), W. E. Wright (Knox), George Soules (Pope-Toledo), Frank E. Wing (Marmon), G. M. Davis (Thomas), C. F. Barrett (Columbia), L. J. Petrie (Stearns), Charles Burnham (Peerless), W. C. Walker (Pope-Hartford), Ernest Keeler (Oldsmobile), G. G. Buse (Packard). Since no winner had evolved and Percy Pierce was one of the perfect score performers, the trophy, according to the deed of gift, remained in the possession of the club which he represented.

But the Automobile Club of Buffalo, at the suggestion of the one who twice had won the trophy for the organization, advised the framing of a new rule, which would prevent the club from retaining possession in case of another tie. Mr. Glidden accepted the changes proposed and now the trophy will go to the club which produces the best team.

#### Where the Rule of the Road Is Not Always Observed.

When it comes to crossing the mountains of Pennsylvania there will be occasions when the tourist will find it advisable to disregard the rules of passing to the right whenever there is a steep declivity or bad ditch on one side. While horses are becoming more and more accustomed to automobiles, there still will be met with equines which have yet to become placidly acquainted with the automobile. Invariably drivers of such horses will take the inside of a mountain road, whether it be on the right or the left, and those on the run will do well to keep this in mind. The same plan is followed in mountainous countries of Europe, especially in Switzerland. It will be well to have an understanding with the driver of the horse-drawn vehicle before passing, motioning as to which side of the road you will take. There will be miles of mountain highways in Pennsylvania where this situation is apt to arise at any time.

#### AIRSHIP "PATRIE" SAILS OVER PARIS.

PARIS, July 8.—For the second time in its brief career the military airship *Patrie*, built by the Lebaudy Brothers for the French Government, has sailed over the capital. With a crew of two officers and two men, the dirigible left the army aeronautical station at Meudon, fifteen miles to the west of Paris, at 7:30 A.M. to-day and headed for the city against a fairly strong northwest breeze. After passing the Eiffel Tower the machine veered toward the northwest, passing over Montmartre, then traveled completely over the city, stopping a few minutes above the Place de l'Opéra. Thousands of spectators watched the evolutions of the balloon, which appeared to be under perfect control. A return was made to Meudon about 9 o'clock. The highest speed attained was 31 miles an hour with the wind, and 18 miles an hour to windward. The *Patrie's* previous appearance over Paris was during the automobile salon last year.

#### AUTO TRAPS ON WAY TO PHILADELPHIA.

PHILADELPHIA, July 8.—Tourists traveling over the main route between Trenton and Philadelphia, via Middletown Township, Bucks County, are warned that the local authorities are operating auto traps as follows:

1. Between Langhorne Borough and Neshaminy Creek, on what is known as Byberry Road.
2. Between Holmesburg Pike and Hulmeville, known as Hulmeville Road.
3. Between Langhorne and Fallsington, leading through Oxford Valley (hamlet).

The tourist is not arrested at the time, but subsequently receives a notice from a Philadelphia law firm, representing the township authorities, requesting him to call and settle, or warrant and appearance will be required.

ONE OF THE THIRTEEN BRIDGES ERECTED TEMPORARILY ACROSS THE GRAND PRIX COURSE NEAR DIEPPE.

## FINAL TRIAL SPINS ON DIEPPE COURSE

**D**IEPPE, June 30.—Tuesday, Wednesday and Thursday last a large proportion of the thousands of visitors gathered here from all parts of the world had an opportunity of watching the cars engaged in the Grand Prix at work on the triangular circuit which will be the scene of the great international contest on July 2. For a month the course has been rigorously closed to racing machines, and those drivers who had not become acquainted with all the sharp turns and grades had to be content with a leisurely jaunt on a touring car under the vigilant eye of Norman gendarmes. The Automobile Club of France enforced this measure to keep the road in perfect condition, and local authorities supported it for the safety of the rural inhabitants, who fear for their lives.

From 3 to 5 o'clock on Tuesday morning thirteen machines were allowed on the course, comprising complete teams of Erasier, Bayard-Clement, Porthos, Motobloc and La Buire. No attempt was made to guard the course, and despite the early hour huge crowds gathered to witness the speeding. Christie and Strang, who were among the spectators, expressed themselves as delighted with the arrangements for the race, but regretted that they had not been able to test their machines on the road as thoroughly as had been done by all the European contestants. Most of the competitors were satisfied with a leisurely run around the course to test their gasoline consumption, Alezy, the late Albert Clement's mechanic, being the only one to travel at top speed over the course.

Darracq, Renault, Panhard, Lorraine-Dietrich and Gobron were given the exclusive use of the course Wednesday morning, also from 3 to 5 o'clock. Rain and wind continuing, some anxiety was displayed by certain drivers as to their ability to finish on the allowance of gasoline. Duray and Rougier had an interesting duel, the former covering the circuit in 44 minutes, or at the rate of 65 miles an hour, and his companion being only one minute slower. Christie was out early on the highway between Dieppe and Rouen, where he covered 100 kilometers, including three complete turns, in 57 minutes, which gives an average of 65 miles an hour.

Thursday morning, the course being thrown open to all the foreign machines, comprising Christie, Fiat, Mercedes, Germain, Hisa, Weigel and Baras' Brasier, the crowd was so dense that it is miraculous no accidents took place. Victor Breyer, general manager for the racing board, as well as the members of the club who were present, did not hesitate to condemn the Dieppe authorities for refusing to allow the road to be guarded by gendarmes. Nazzaro, on his Fiat, made an excellent impression by traveling round the course in 42 minutes, thus confirming the good opinion already held of him here. Christie made a couple of rounds in good time, the manner in which his machines took the curves calling forth much admiration. The two Weigel machines only arrived from England at three o'clock and one hour later were on the course, but failed to show anything more than a moderate speed. By six o'clock the two

VICTOR BREYER, SECRETARY OF THE COMMISSION SPORTIVE.

CHRISTIE AND HIS GRAND PRIX RACER WITH A DIEPPE SETTING.

**GILLET-FOREST, CANDIDATE FOR SPORTING COMMISSION CUP.**

Britishers were back in Dieppe, where they took possession of the only two empty rooms to be found in the town, and refused to move out despite the cries and gesticulations of the landlord. Contrary to last year's muddle of figures on the Sarthe course, the score board on the Dieppe circuit will be the embodiment of simplicity, declare officials. Total elapsed time only for each machine will be recorded on the score board, and not clock time as on previous occasions. On the completion of each round the general classification, again with elapsed time, will be published on a separate board. The machines of each nation having been given a distinctive color, the same colors will form the ground work on which the names of the cars will be painted on the score board. To enable spectators to calculate the rate of travel for each round, a printed table will be distributed showing the time necessary to cover the 77 kilometers of the course at all speeds from 80 to 125 kilometers an hour. Sporting Commission machines will have their own score board, their times being kept quite distinct from that of the Grand Prix racers.

#### DUPUY AND STEARNS VISIT FRENCH CLUB.

PARIS, July 1.—Tanned by sixty days' exposure to the fiery rays of the southern sun, the blinding mistral and mountain winds, Georges Dupuy piloted his dusty, travel-stained Yankee Stearns through the octroi gates at Vincennes Saturday last, passed down the crowded Grands Boulevards and drew up in front of the majestic home of the Automobile Club of France on the Place de la Concorde with a toot of the horn containing a world of significance. As the manager of the Gold Cup tour descended triumphantly from behind the steering wheel and advanced both hands to greet the twenty-five pairs outstretched to meet him, there was a touch of pardonable pride in his rejoinder, "nothing could have been easier" to the slightly sarcastic *Tiens*, got back?"

Although the American caravan, as the French have unanimously dubbed it, will not be seen in France this year, Dupuy's preliminary trip has made its realization possible next summer under most favorable conditions. A start was made from New York at too late a date, and although no time was wasted en route, so much detail work had to be attended to and so much information gathered for the guide book to be published on touring in Europe that the original schedule could not be adhered to. This preliminary journey of 4,000 miles through France, Spain, Italy, Austria, Germany and Belgium proved that the tour is one of the most interesting and agreeable to be found in the whole world. Compared with America, road conditions throughout are ideal, and there is a wealth of old world customs, historic scenes and varied scenery such as can be found nowhere else. Starting from Antwerp, Dupuy relates that he ran directly to Paris, where the actual work of organizing for

the final tour commenced. From the French capital the run was into Normandy and Brittany, doubling back to Le Mans in order to make a complete circuit of the Chateaux of Touraine, then down to Bordeaux, followed by an all-night journey, time being precious, as far as Bayonne on the Spanish frontier. Here the original plan had to be departed from, the Stearns only proceeding over the Pyrenees as far as San Sebastian, doubling back and heading for the French shores of the Mediterranean. Points touched on the southern run through Italy were Genoa, Florence, Rome and Naples, the machine then heading northward along the shores of the Adriatic into Austria and Germany. Vienna, Dresden, Berlin, Hanover and Cologne each had an opportunity of inspecting the American machine, and the entry into France was made through Belgium, and after which a straight run was made to Paris. England was not visited on the preliminary trip, touring conditions there being so well known and the British clubs having offered to give generous help in the organization of the journey.

Not only in Paris, but throughout all the town en route where European touring machines are familiar sights, the liveliest interest was shown in the American machine. The safe return to Paris has brought before the public the fact that other than French machines are capable of undertaking a journey which calls for the highest qualifications. American machines have often been round Europe individually, but it needed the publicity attached to the performance of the Stearns to bring their value prominently before the French public. Georges Dupuy intends to run to Havre in a few days and will ship his machine for New York, arriving there about the middle of the present month, and will immediately begin work on next year's plans.

#### MANAGEMENT PERFECT, SAYS MR. THOMPSON.

PARIS, July 6.—Chairman Jefferson DeMont Thompson, of the A. A. A. Racing Board, has arrived here on his automobile from Dieppe, where he was the guest of the Automobile Club of France at the Grand Prix. He is enthusiastic over the excellent management of the race, and declares the patrolling of the course by troops and gendarmes was perfect, while the arrangements controlling the cars themselves could not have been better.

**GEORGES DUPUY FINISHING TOUR BEFORE THE A. C. F.**

IN view of the action of the New Jersey Assembly in passing the special bill permitting the use of the Jersey roads for the Vanderbilt Cup Race this fall with but five dissenting votes, it would appear as if its ratification by the Senate were merely a formality, and that the holding of the race is assured. The Senate is to convene this week and, it is believed, will act favorably upon the measure without delay, and as Governor Stokes has already given his approval to the Racing Committee of the American Automobile Association, he will doubtless sign the bill at once. Jefferson DeMont Thompson, chairman of the Board, who is now abroad, has been kept advised of the developments and will be notified by cable of their successful culmination, in which event he will make arrangements to obtain foreign entries before returning to New York.

A. R. Pardington, acting chairman of the A. A. A. Racing Board; F. H. Elliott, secretary of the American Automobile Association, and Charles T. Terry, chairman of the Association's Legislative Board, visited Trenton on Monday and held a long conference with Governor Stokes regarding the prospects for holding the race in New Jersey in October. The Governor is heartily in favor of it, and believes the Senate will unanimously concur in the action of the House, which has already given its sanction, the bill having been introduced by Assemblyman Randolph Perkins, of Union County, himself an enthusiastic automobilist. At least thirteen Senators are counted upon as being favorable to the measure, while only eleven are required to pass it.

Once in effect, there is little doubt that at least half a dozen

counties will bid for the event. There is already a good sized boom in Monmouth County to obtain it for that section, the most favored course being that from Lakewood past the Rockefeller estate to Burnside, 5 miles; straight to West Point Pleasant, 9 miles; to Manasquan, Sea Girt, Spring Lake and Como, 15 miles; to Five Point Corners to Alairs, 22 miles, and back to Lakewood, 28 miles. This is, however, but one of the many thirty-mile circuits which can easily be found in the State once the proper sanction is obtained. Naturally, no course will be decided upon until the officials of the A. A. A. have closely inspected all the most desirable locations. The route will naturally be kept as far away from large towns as possible, and will also be one that is not too accessible from New York.

In anticipation of favorable action without delay, the Racing Board of the A. A. A. has held several conferences within the past few weeks, at most of which W. K. Vanderbilt, Jr., was present, though no public announcement will be made until it is possible to issue entry blanks. The date for the elimination race, however, has been set for October 5, with October 19 as the date of the race itself, though it is hoped to be able to dispense with the running of an elimination race altogether, and even though it should be necessary to hold such trials, it is by no means certain that they will be run off on the regular cup course. The Association has made all preparations for the holding of the race, and is only awaiting the favorable action of the New Jersey Senate, on which point there appears to be little or no doubt of success, so that a Vanderbilt Cup Race over a Jersey course seems assured.

ON THE SPRINGFIELD ROAD, NOT FAR FROM PLAINFIELD, ONE OF NEW JERSEY'S HIGHLY IMPROVED THOROUGHFARES.

BOULEVARD AT WILDWOOD WHICH WAS USED FOR RACING.

## WILDWOOD'S TWO-DAY CARNIVAL.

WILDWOOD, N. J., July 5.—The two-day automobile carnival which has made the habitués of this resort forget their wonted amusements for the time, and has brought the virtues of the billiard table as a couch to the fore, came to a close yesterday afternoon in a speedfest which even the blasé racegoers admitted was first class. The direct rays of the limelight were concentrated, of course, on the 120-horsepower Thomas Flyer, driven by Montague Roberts, which demonstrated its ability to the satisfaction of the expert and tyro alike. Twice it officially burned up the mile course in the fast time of 46 and 44 seconds. Although nearly 100 feet wide, Central avenue is but a trifle over a mile and a half long, and, with but a quarter mile at either end to attain speed and halt, Roberts was badly handicapped, as he had to shut off long before the finish.

In the free-for-all the Stanley 30, driven by Walter Harper, was but 50 yards behind the big Thomas at the finish, with the Stearns 30-60, Hoffman driving, but 20 yards behind the steamer. The Stanley's time was figured out at .52 flat and the Stearns at 53 4-5. In the time trials Roberts did the mile in 0:44 flat—a most excellent performance under the circumstances.

Another fast race was that for the Hand Cup, which went to the Packard 30, which, with Samuel Cullom driving, negotiated the course in 1:05. The Oldsmobile 35, George Parker up, captured the \$2,750-and-under gasoline class race for the Wildwood-by-the-Sea Cup in 1:05 from a big field. Harper drove his 20 Stanley to a win in the Quaker City Motor Club runabout race for the Martindale Cup in 1:06, and in the touring car class open only to Quaker City members "Ollie" Hoffman beat out the Chadwick and the Stanley in the fast time of 1:03 4-5.

In the \$3,500-and-under class for the Founder's Cup Roberts evidently had the other drivers scared, for he was allowed to pull down the cup in the comparatively slow time of 1:09 1-5 from such fast cars as the Stearns 30-60 and the Chadwick 60,

which had negotiated the course under the minute several times in practice. Following is a summary of the races:

### GASOLINE CARS, \$1,500 AND UNDER.

- |  |          |
|--|----------|
|  | Time     |
| 1. Reo, 16-h.p.; driver, George Vennell..... | 1:14 1-2 |
| 2. Buick, 22-h.p.; driver, C. A. Godshalk.   |          |

### GASOLINE CARS, \$2,750 AND UNDER (WILDWOOD CUP).

1. Oldsmobile, 35-h.p.; driver, George P. Parker..... 1:05
2. Wayne, 35-h.p.; driver, N. C. Mullen.
3. Maxwell, 40-h.p.; driver, W. C. Longstreth.

### FOUR-CYLINDER CARS, \$2,000 AND UNDER (ELSA CUP).

1. Buick, 24-h.p.; driver, C. A. Godshalk..... 1:40
2. Moline, 24-h.p.; driver, J. A. Bunn.
3. Mora, 24-h.p.; driver, Wm. M. David.

### OPEN, \$5,500 AND UNDER (FOUNDER'S CUP).

1. Thomas, 60-h.p.; driver, Montague Roberts..... 1:09 1-5
2. Stearns, 30 to 60-h.p.; driver, Oliver W. Hoffman.
3. Chadwick, 60-h.p.; driver, William Haupt.

### UNATTACHED OWNER'S RACE (HAND CUP).

1. Packard, 30-h.p.; driver, Samuel Cullom..... :60 1-5
2. Stanley, 20-h.p.; driver, M. F. Dobbins.
3. Stoddard-Dayton, 30 to 35-h.p.; L. W. Dykeman.

### FREE-FOR-ALL (GREAT CUP).

1. Thomas Flyer, 120-h.p.; driver, Montague Roberts..... :46
2. Stanley, 30-h.p.; driver, D. W. Harper.
3. Stearns, 30 to 60-h.p.; driver, O. W. Hoffman.
4. Packard, 30-h.p.; driver, Samuel Cullom.

### QUAKER CITY MOTOR CLUB RUNABOUT (MARTINDALE CUP).

1. Stanley, 20-h.p.; driver, D. W. Harper..... 1:06
2. Packard, 30-h.p.; driver, Samuel Cullom.
3. Oldsmobile, 35-h.p.; driver, George P. Parker.

### QUAKER CITY MOTOR CLUB TOURING CARS (OTTEN'S CUP).

1. Stearns, 30 to 60-h.p.; driver, O. W. Hoffman..... 1:03 4-5
2. Chadwick, 30-h.p.; driver, Edward Wilkie.
3. Stanley, 20-h.p.; driver, M. W. Dobbins.

### GASOLINE CARS, \$2,500 AND UNDER.

1. Stoddard-Dayton, 30 to 35-h.p.; driver, L. Dykeman.... 1:18 1-5
2. Wayne, 30 to 35-h.p.; driver, W. C. Mullen.
3. Buick, 24-h.p.; driver, C. A. Godshalk.

### TIME TRIALS (CITIZENS' CUP).

1. Thomas Flyer, 120-h.p.; driver, Montague Roberts..... :44  
(All other contestants withdrew.)

### TIME TRIALS, FULLY EQUIPPED TOURING CARS.

1. Autocar, 30-h.p.; driver, W. G. Brooks..... 1:18 1-5

The tournament began on Wednesday afternoon with a reliability run of the Quaker City Motor Club and unattached automobilists from Gloucester to this place, in which forty-five cars took part. The run was a nearest-to-a-mile-in-three-minutes affair, and checkers were located at unknown points along the 82-mile course to keep tabs on the contestants as they passed. In this manner those who exceeded or fell behind the 20-miles-an-hour schedule were easily apprehended. The roads were in such condition and the country so flat that the majority of the cars would have had little difficulty in making the run in two and a half hours. The committee, after a three-hours' wrestle with the checkers' lists and starters' and judges' cards, announced Evans Church, driving a White steamer, as the winner of the Quaker City Motor Club class cup, and J. F. Buchanan, in a Royal Tourist, as the victor in the unattached class. To Church went the real honors, for Buchanan had a five-point penalty chalked up against him by the first checker. After the run all the competing cars were placed on exhibition on the Board Walk, and this phase of the carnival was a huge success. On the morning of the Fourth over a hundred cars turned up for the big parade along the five-mile Board Walk. First prize in the touring car class was awarded by the judges to the West-Stillman Company's Pennsylvania, with a handsomely decorated Thomas Flyer a close second. In the runabout class A. L. Kull's Golden Dragon was the unanimous choice of the judges, and Herman Buckborn's Oldsmobile was awarded second honors.

## DENMARK'S INTERNATIONAL AUTO SHOW.

In connection with the Copenhagen International Automobile show, from September 28 to October 7, a brief descriptive handbook has been issued in English by the organizing committee. Denmark being the largest user of motor boats in the world, considerable attention will be paid to power craft; commercial vehicles, motors for agricultural purposes, lifeboats and automobile fire equipments are to form important sections of the show. Chairman Herr L. Bendixen, of Copenhagen, has charge of entries.

MONTAGUE ROBERTS AND THE THOMAS "VANDERBILT CAR."

# MATERIALS FOR AUTOMOBILE CONSTRUCTION\*

By THOMAS J. FAY, E.E.

THE right thing for the place demands as a condition that the place be located, and so it is with the automobile—the service for which an automobile is designed must have a lot to do with the class of materials to be selected and used. In the main, it will be possible to say, high-speed cars must be light and hence the materials must have great initial strength, whereas on the other hand low-speed automobiles do not have to be so light and so it is feasible to employ comparatively more of the weaker material.

Skill and judgment can be displayed in the selection of the several grades of materials for the respective parts, in view of the service to be rendered, and the cost, as well as the degree of satisfaction, must depend almost entirely upon that skill. In any establishment devoted to the manufacture of automobiles there are several matters to be viewed with more or less alarm, and they must receive mention here because the question of the materials of construction depends to some extent, if not in a large measure, upon them.

One extremely serious question is the relation of the purchasing forces to the designing department. It is not at all uncommon to find that between the departments that fix upon the sizes of parts and the forces that select and purchase the materials there is no binding relation, and in some cases not even the outward semblance of accord. It is useless to depict a part, such as a crankshaft, axle or radius rod of any size, demanding specification steel, unless the desired grade of steel is purchased. This is so self-evident that it would seem wholly unnecessary to even mention the fact; but it so often happens that the materials purchased are not in conformity with the specifications that it is not only desirable but necessary to emphasize the fact and deplore the circumstances.

There are times of industrial exhilaration during which it is difficult to procure materials of some extra quality, and this circumstance is frequently accepted as an excuse in the purchase of inferior products. Sometimes vendors who prefer to dispose of wares in stock claim equally high ability for what is obviously inferior product and sustain their claim with incompetent purchasing representatives whose position and authority enable them to disregard the specifications. In any case, it is quite plain to be seen how essential it is to fix upon the materials to be employed in any given situation, and having done so, to allow a vendor or representative to disregard the requirements is equal to not having fixed upon that quality at all. This is not to say everything should be as fine as possible from an abstract point of view, for in many situations positively low grades of materials can be made to serve perfectly well, and it should be considered no impropriety to utilize such products when the situation warrants.

Of the parts in an automobile, some of them cannot be altered in quality with the weight or speed of the car, and should be considered on a basis representing the responsibility of position, as, for instance, crankshafts must be looked upon as quite independent of car weight or speed and should be designed in view of:

- (a) The diameter of one cylinder.
- (b) The diameter and weight of the flywheel.

It not infrequently happens that even a one-cylinder motor holds all the conditions that would demand the use of an alloy steel crankshaft of the most excellent quality. Where a car, by striking an obstruction, as when the wheels depress into a mud hole, arrests the motion of a flywheel of good diameter and some weight, the dimensions and quality of the crankshaft will there be fixed quite independent of all other considerations.

What must be claimed, then, is that crankshafts are governed, in so far as their materials are concerned, by special and more or less independent considerations, some of which are too obvious to require mention here. Moreover, crankshafts must be of extra good quality of material to be worthy.

The selection can be made over a wide range merely because a wide range of superior steel is afforded, but there is very little carbon steel that can properly apply to an automobile crankshaft; indeed, the author does not recommend the use of carbon steel for the purpose, although much carbon steel is employed under product No. XXXXIL., and would serve very well for certain classes of motors—that is, four or six-cylinder motors with a bore and stroke of four inches or less and a flywheel sixteen inches in diameter or less. But this material would not be nearly so secure for the purpose as No. LI. or numerous other products available, and at equal cost for finished crankshafts it would be absurd to select the carbon steel product instead of chrome-nickel or chrome-vanadium steel.

The reasoning that applies to crankshafts applies equally to the several other parts, provided only an allowance be made for the respective duties, and the selection be made accordingly. The most direct way to settle this matter would be to name the parts and state the quality of materials for each under the varying conditions. True, this method of procedure would leave out the reasons, but they are more or less obvious and the purpose here is to compact as much actual data as possible in such form as to render it readily available. With this idea uppermost the data will be set down in the Table A, and besides giving the names of parts the qualities of materials will be referred to by test record numbers, thus enabling selections over the broadest ranges and in view of the service to be rendered.

TABLE A.

## MATERIAL CLASSIFICATION.

**Dynamic Work.**—Including crankshafts, distance rods, clash gears, piston pins, jackshafts and parts generally which are required to sustain prime shock loads should be composed of materials as follows:

- |  |   |                                  |
|--|---|----------------------------------|
| From the finest raw materials low in sulphur and phosphorus. | } | (a) chrome-nickel steel          |
|  |   | (b) chrome-vanadium steel        |
|  |   | (c) chrome-nickel-vanadium steel |
|  |   | (d) chrome-wolfram steel         |
|  |   | (e) silico-manganese steel       |
|  |   | (f) chrome steel                 |
|  |   | (g) vanadium steel.              |

**Static Work.**—Including parts subject to high static loads; no shock.

- |  |   |                                   |
|--|---|-----------------------------------|
| From fine raw materials, fairly low in sulphur and phosphorus. | } | (a) chrome-nickel steel           |
|  |   | (b) chrome-vanadium steel         |
|  |   | (c) vanadium steel                |
|  |   | (d) silico-manganese steel        |
|  |   | (e) finer grades of carbon steel. |

**Static Work.**—For minor drop forgings and other parts of small responsibility.

- |  |   |                                  |
|--|---|----------------------------------|
| From excellent grades of raw material. | } | (a) chrome-nickel steel (mild)   |
|  |   | (b) chrome-vanadium steel (mild) |
|  |   | (c) mild carbon steel            |
|  |   | (d) wrought iron.                |

There are many cars in which the materials employed are not nearly so good as the products listed for parts in Table A, and for that matter the tests given in this work, such as are recommended for use, are of much finer steel than that to be had by ordering "machine steel" or "cold rolled steel" or even some "brands" of steel. The test No. CV. is of an average machine steel product and as an inspection of it will show, this product has no rightful place even in a low-priced runabout, although there are uses for just such steel, but not in automobiles. Table A does not provide for absolutely everything for an automobile, but space would not allow of any such amount of detail; moreover, so many parts are so obviously like other parts in so far as duty is concerned that they will readily suggest themselves.

\* Extract from Chapter I, Materials for Automobile Construction. By Thomas J. Fay, E.E. Published by the Class Journal Publishing Company, New York.

Table D is a large data table with columns for Bolt Diameter (D), Bolt Length (L), Bolt Head Diameter (H), Bolt Head Thickness (S), Bolt Head Width (E), and Bolt Head Height (E). The table lists various bolt sizes and their corresponding dimensions. To the right of the table is a section titled 'INFORMATION' containing 'U.S. STANDARD THREADS' data and a note: 'THE COLUMN ON THE RIGHT GIVES THE NUMBER TO BE SUBTRACTED FROM THE DIAMETER TO OBTAIN THE CHAMFER READING. ALL BOLTS TO BE 1.00 TO O.D.S. ABOVE DIAMETER GIVEN.'

design was faulty, as the shoulders were sharp, whereas they should have been rounded. The question also enters into this matter, for if chrome-nickel steel or some other good alloy steel were used there would have been no need to increase the size and the weight after numerous customers were made sad by their purchase. True, the shoulders should be rounded in any event, but alloy steel, even with sharp shoulders of the diameter given in Figure 2, would transmit the power of the motor used and have a large margin to spare.

In general, weight is deplored because of the effect of weight on pneumatic tires, but it is equally a disadvantage from every other point of view. The effect of weight is rendered potent when power enough is provided to create speed; in general, it will be possible to compare weights and speeds as follows:

- (1)  $88^2 \times 4,000$   
 $\text{—————} = 480,923 = E.$   
 $2 \times 32.2$
- (2)  $44^2 \times 2,000$   
 $\text{—————} = 60,124 = E.$   
 $2 \times 32.2$
- (3)  $22^2 \times 1,000$   
 $\text{—————} = 7,515 = E.$   
 $2 \times 32.2$
- (4)  $11^2 \times 12,000$   
 $\text{—————} = 22,546 = E.$   
 $2 \times 32.2$

E=Energy of impact, neglecting some minor friction considerations.

- (1)=Standard touring car at one mile per minute.
- (2)=Light touring car at half a mile per minute.
- (3)=Small electric runabout at one-quarter mile per minute.
- (4)=Large truck at one-eighth mile per minute.

The energy of impact is a certain measure of the stresses speed will engender in the parts, but to render such a comparison of value the static moments must be adjusted to suit the respective cars. In other words, a 12,000-pound (gross) truck requires axles of a greater section than a 4,000-pound touring car because the static load is 12,000 pounds instead of 4,000 pounds, but the

materials would not have to be so fine because the impact moment of 12,000 pounds at  $7\frac{1}{2}$  miles per hour is only 22,546 foot pounds, whereas the energy of impact of 4,000 pounds at 60 miles per hour would be 480,923 and  $\text{—————} = 21.33$  ratio in favor of the truck.  
 $22,546$

This is not to say that trucks may be built of materials over twenty-one times inferior to those now used in touring cars, but it does mean, that material that is as good as possible being used in trucks, it should be twenty-one times better for touring cars.

In deciding upon the quality of material to use it is necessary to fix the speed, because the speed factor of the moment of impact is a square value. If this matter were to receive its due measure of serious consideration, builders of cars would not be

Bolts, for instance, are not provided for, but the Table D takes care of this matter in a very simple and on the whole effective manner. This standard of bolts and nuts was devised by the author for the S. & M. Simplex cars, July 15, 1904, and was revised and issued for the Ellsworth cars in the manner shown in Table D. The quality of material to use in bolts and nuts is not easy to fix upon, because much of the alloy steel tried for this purpose proved to be of no great value. The chrome-nickel steel, test No. LIII., would be thoroughly good and is used by the author for important bolts and nuts. The nickel-steel, test No. LXXXXV., would be a good second, but ordinary nickel-steel answering the United States Government specification is not recommended.

This product, No. LXXXXV., was tried out for bolts, nuts and small parts in the B. L. & M. 1906 racing car and proved to be most unworthy indeed; where the author found this product so uncertain for even moderate service it was decided to substitute chrome-nickel steel No. LII., and the trouble at once ceased. Instead of the product No. LII., the material No. LIII. is, of course, a good advance, but it would be ridiculous to double the cost of material if the lower-priced product is good for the purpose under consideration.

This question of cost is certainly a most complicated and on the whole serious matter, because the cost of a car seems to be an easy thing to increase, and good practise ceases when dividends "balk." The good resolves of the designer may far exceed the ideas of the managing director, and after all purchasers are only entitled to what they pay for. This does not imply a license to use material that will not serve a given purpose at all, but it does mean that exceeding the actual necessities will hardly do.

The question of allowable weight should receive some attention just at this time, because weight and speed are the factors that must settle all questions of material, as regards both quantity and quality, assuming, of course, that designs are in accord with correct principles. It is not always the case that the latter are satisfactory, but such mistaken notions will be narrowed down by the law of evolution. Figure 2 is an illustration of just such a case and represents the end of a crankshaft on which a planetary change-speed gear was stuck. A large number of cars were put out with this feature and a considerable percentage of them must have given trouble, for every one that came to the author's attention broke at the same place.

The law of evolution took care of this matter because subsequently the maker changed the design, but the law has not settled this case yet, for the material must be changed as well. The

so anxious to increase horsepower, as some of them are wont, although the purpose here is to state effect and not to advocate the illumination of causes. In a general way the effect of increasing the power is most disconcerting because it increases the impact without increasing the quality of the material. Before dropping this phase of the subject it may not be amiss to make a comparison on the basis of the change required in the quality of material if power be increased.

For the sake of comparison, assume a car of carbon steel with a gross weight of 3,000 pounds and an attainable speed of 40 miles an hour, which would be a reasonable expectation with a 25-horsepower motor. Such a car would, in all probability, be generally satisfactory in carbon steel, excepting the crankshaft and maybe the gears, which parts could be of alloy steel without materially increasing the cost of the car. Now put in a 50-horsepower motor, which, of course, would weigh 50 per cent. more than a 25-horsepower motor, and as a reasonable expectation the speed would go up 50 per cent. To keep the weight at 3,000 pounds alloy steel would have to be resorted to.

The result of such a change would be an increase in speed from 40 to 60 miles an hour and the stresses in the materials would go up enormously, as can be gleaned in a moment, because:

$$(1) \frac{58.66^2 \times 3,000}{2 \times 32.2} = 160,295 = E.$$

and

$$(2) \frac{88^2 \times 3,000}{2 \times 32.2} = 360,745 = E.$$

Taking into account the reduced sections of strain members to keep the weight constant at 3,000 pounds as before fixed, and the ratio of the impact (1) to the same moment (2), it would indicate a decided demand for alloy steel, because:

$$\frac{360,745}{160,295} = 2.25 \text{ ratio against carbon steel.}$$

Taking into account the necessary decrease in the alloy steel section to make allowance for the desired decrease in weight, it is reasonable to expect that the elastic limit of the alloy steel should be at least three times that of the carbon steel, taking into account an elongation common to the two grades of steel.

If carbon steel possesses an elastic limit of say 30,000 pounds per square inch, which is a fair average for the usual product, then an alloy steel with an elastic limit of 90,000 pounds would

satisfy the conditions of the example of the moment. But the alloy steel with the elastic limit so fixed should have an elongation substantially equal to that of the carbon steel displaced; moreover, the contraction should be from two to three times the elongation, preferably the latter.

It will be observed that the alloy steel, under the conditions set down, will have all it is capable of doing to hold out for a reasonable period of time, and this fact should prove very disconcerting to the users of inferior carbon steel products who are wont to claim that chrome-nickel steel is a wholly uncalled-for refinement.

It might be said, if car-

bon steel will do for a 3,000-pound car, powered to run at 40 miles an hour, why not be satisfied with carbon steel and 40 miles an hour? But the author does not hold that carbon steel, 3,000 pounds and 40 miles an hour will make as good a proposition as alloy steel; 3,000 pounds and 40 miles an hour. Moreover, it is plain to be seen that the carbon steel car would be comparatively an inferior product at any weight and speed. Thus far all attempts to fix upon the materials best for the purpose were based entirely upon the relation of stress to strain, but there is one reason alone that absolutely dictates not only low weight, but moderate speed, and that is tires.

There is no grade of material too good to use in automobiles, if it will reduce weight, provided power is reduced so as to maintain a constant speed and thereby reduce the cost of tire maintenance. It is impossible to say just what are the laws that hold for tires, but it is reasonable to assume that low speed and light weight are important factors in the life of the tire, although good roads must be taken into account as an equally important factor. Assuming a given size of tires, a good road and fair conditions of operation, and it will be possible to fix upon tire relations with a fair degree of accuracy about as follows:

AT A CONSTANT SPEED.

Weight of Car.	Life of Tires.	Speed of Car.
4,000	12.5	40
2,000	25	40
1,000	100	40

If the car be run until the tires wear out—in other words, tire “rot”—is a separate matter not taken into account here. The above relation is a strong argument for fine materials, provided the weight of the car is cut down by their use. If, on the other hand, the reduction in weight is attended by an increase in speed, the advantage is of the *minus order*, for the increase in speed is attended by an increase in tire depreciation, which is to be guarded against. In all probability speed affects tires in excess of a ratio represented by the velocity squared, and the life of the tire will be affected at least in proportion to the square of the velocity. Taking this as a basis, it will be possible to view the speed phase of the question in another light, assuming that a constant power, equal roads and a decrease in weight would result in an increase in speed.

AT A CONSTANT POWER.

Weight of Car.	Speed of Car.	Life of Tires.
4,000	40	12.5
3,000	53	9.25

SUBJECT: NICKEL STEEL  
 NUMBER: LXXXIV MARK: USCAR  
REGULAR PRODUCTION.  
 NEW YORK 4-17-07

MUCH USED FOR CRANKSHAFTS AND OTHER PARTS OF RESPONSIBILITY.

THIS PRODUCT WHEN FREE FROM "PIES" AND "SEAMS" WHICH IS BY NO MEANS A MAJORITY CONDITION, SERVES EXTREMELY WELL IN MEDIUM POWERED MODERATE SPEED CARS FOR PARTS OF RESPONSIBILITY.

UNDER SKILLED TREATMENT NICKEL STEEL RESPONDS TO GOOD ADVANTAGE, BUT IT IS A MOST UNCERTAIN PRODUCT IN UNSKILLED HANDS.

IT IS NOT IN ANY SENSE EQUAL IN QUALITY TO CHROME NICKEL STEEL SEE LXXXIII FOR THE RESULTS OF SKILLED TREATMENT.

SUBJECT: CHROME NICKEL STEEL  
 NUMBER: LIII MARK: USCAR  
FROM: FELIX BISCHOFF DUIS-  
BERG-RHINE NEW YORK 4-17-07

USED FOR EXTREMELY IMPORTANT PARTS, REQUIRING MUCH FORGING. WILL NOT HARDEN ON QUENCHING EVEN FROM A HIGH TEMPERATURE BUT CEMENTS WELL.

THIS SOFT GRADE OF CHROME NICKEL STEEL CAN BE EXPANDED INTO REAR SPROCKET WHEELS, UP TO SIXTEEN OR MORE INCHES IN DIAMETER, AND MAY BE FORGED AT 1050°C. WHICH IS A FAIRLY HIGH HEAT AT WHICH TO FORGE ANY ALLOY STEEL THE TOTAL OF THE METALLOIDS - 0.409% FOR SILICON, SULPHUR, PHOSPHOROUS AND MANGANESE IS VERY LOW.

Since the materials entering into the construction of automobiles are so dependent upon speed, to conclude this portion of the material question without fixing upon the attainable speeds would be an oversight. Table C will serve the purpose extremely well and gives other valuable data besides. This table was published in the *Horseless Age* last year to illustrate the fact that the extravagant claims of speed on the part of motorists are rarely borne out in fact. In concluding this part of the subject there is one thing that cannot be overlooked, and that is a speedy car on a level, hard road does very little damage to itself, but

the same car on a bad road, in the hands of a careless driver, can scarcely survive unless the materials are suitable. Speed, then, and good materials must go together, and if inferior materials must be used they belong in low-powered cars, in which event a little extra weight is a matter of no serious moment if the tires are big enough to carry it.

EDITOR'S NOTE.—Owing to space limitations much of the data referred to by numbered tests, to which a special chapter is entirely devoted in Mr. Fay's work on materials, has necessarily been omitted.

TABLE C.

SPEED TABLE—35 HORSEPOWER MERCEDES, 1906  
 REVOLUTIONS OF THE MOTOR—1,100 PER MINUTE

No. of Teeth of Sprocket Wheel.	17	18	19	20	21	22
Speed	M. P. H.	% Grade	M. P. H.	% Grade	M. P. H.	% Grade
One.....	11.14	22.5	12.7	19.6	13.4	18.6
Two.....	24.6	8.3	26.1	7.5	27.4	6.9
Three.....	32	5.2	34	4.5	35.8	3.8
Four.....	41.6	2.6	44.1	1.76	46.6	1.4
REVOLUTIONS OF THE MOTOR—1,200 PER MINUTE						
One.....	12.4	22.5	13.2	21	13.9	19.6
Two.....	26.8	8.3	28.3	21	29.9	6.9
Three.....	34.9	5	37	7.5	39.9	3.6
Four.....	45.4	2	48.1	4.3	51	1

In the calculations of this table the air resistance for the complete car, with touring coach work and four passengers, is taken into account, the total weight being 3,760 pounds. For cars with a heavy body or a canopy top the speeds are smaller, corresponding with the greater weight. The cars are usually furnished with sprocket wheels of 18, 20 and 22 teeth. Sprocket wheels of 17, 19 and 21 teeth are furnished instead of the standard wheels, if so desired.

SIMPLEX 30 HORSE POWER TOURING CAR  
 Mileage Table

No. of Teeth in Driving Sprocket	23	25	27	29
Speed	M. P. H.	% Grade	M. P. H.	% Grade

Two.....	13	10.5	18.5	12.65
Three.....	21	10.5	26	7.4
Four.....	37	3.65	41	2.62
Reverse.....	8	29.6	8.7	29.1

This table of speeds and gradient is based upon the conditions of a maximum weight of the car and its burden of 3,760 pounds, a level, hard roadbed, no wind, and the car in good working order.

## THE SELECTION OF A PROPER LUBRICANT

By ROGER B. WHITMAN.

In the early days of the automobile industry a manufacturer was satisfied if his car could be depended on to cover fifty miles without a halt, and points that are now considered to be of paramount importance were entirely overlooked in comparison with the necessity for producing an engine that would run. With the advance in automobile construction has come a constant improvement of detail; until at the present time the designers are giving prominence to points hitherto passed over as too trivial to consider. Improvements in lubricating systems have been marked, for the proper oiling of the various bearing surfaces was early recognized as being essential to the life of the mechanism, but too little attention has been accorded to the selection of the lubricants to be used in them. The owner of a car is usually under the necessity of accepting the statements of the supply man, buying the oil that is most strongly recommended, and, knowing little of the subject himself, he takes for granted that what he gets is the best that the market offers.

As a matter of fact far more depends on the choice of an oil than is generally supposed, as a lubricant for use in the cylinder of an internal combustion engine must possess certain characteristics in order that the engine may deliver its full power with the least possible wear. To appreciate this it is necessary to understand something of the service that a lubricant is required to give and the way that it does its work. Primarily, the function of a lubricant is to interpose a film between the two surfaces of a bearing, separating them, and acting in a manner similar to a ball bearing. This similitude to a ball bearing is not so extreme as it may seem to be at first sight, for the particles of oil may be considered as balls rolling between the two surfaces. Without this film of oil the friction between the surfaces would generate heat, and as heat causes expansion the binding of the bearing would be the result. The first requisite of an oil is its ability to keep the two surfaces of a bearing separated; in other words, it must be of such a character that its particles will be capable of resisting the tendency to squeeze out, caused by the pressure on the bearing. This characteristic, which enables the oil to resist an attempt to separate its particles, is cohesiveness, or, technically, viscosity. The greater the viscosity of an oil the more its particles will cling together and resist the pressure of the bearing that tends to separate them and squeeze them out. The viscosity of gasoline and kerosene is almost nil as compared with that of heavy oil, and they would run out of a bearing as fast as they were poured in. It is this characteristic that determines the difference between the grades of light, medium and thick oils, and the selection of one of these depends on the service demanded, a bearing that supports a great weight requiring a heavy oil of high viscosity, in distinction to a bearing carrying a light load, that may be fed with a thin oil.

An oil that forms a film between the surfaces of a bearing operating at the ordinary temperature of the atmosphere is doing all that can be expected of it, but if the bearing is normally at a high temperature another element must be reckoned with. When any oil is heated it becomes thinner, and the first effect of this is the reduction of the viscosity; its particles will be rendered less cohesive. This need not be considered in the selection of a lubricant for the change speed gear, wheels and axles or similar parts of an automobile, for if these are properly designed their temperatures should not vary from that of the atmosphere to any great extent. A much more complex problem is presented in the proper lubrication of the pistons and cylinder walls of the engine.

The intense heat in the cylinder at the moment of combustion imposes a severer duty on the lubricant than can be duplicated elsewhere, and no oil can be made that will not eventually

be consumed, passing off with the exhaust. To lubricate the piston and cylinder is similar to supporting on ball bearings a load so heavy that the best balls will ultimately be crushed, and the necessity of constantly supplying new balls to take the place of those destroyed. The better the material of which the balls are made the longer they will resist the crushing action of the bearing, and, similarly, the higher the burning point of an oil the longer it will continue to perform its duties as a lubricant before the heat decomposes it. The processes of giving an oil a high burning point are well understood, and there are many brands on the market that in this respect offer all that can be desired.

A further and more important distinction, however, must be made regarding the oils that will burn and pass away, leaving the least possible residue. The carbon that enters largely into the composition of oils will, on the destruction of the oil in the cylinder by the heat, enter into combination with any oxygen that is present and pass off as  $\text{CO}_2$ , but with a properly proportioned mixture the amount of free oxygen present in the cylinder is very small, and the carbon is therefore deposited on the walls of the combustion space. The automobilist knows the result of this only too well, and has had his experience with fouled spark plugs, gummed piston rings, stuck valves and the other effects of this heavy carbon deposit. The parallel of the ball bearing supporting the excessively heavy load may be again referred to. If the balls are such a material that when crushed they will be reduced to powder, there will be little interference with the operation of the bearing, but if they break into fragments these will remain in the races and bring the remaining balls to quick destruction. Obviously the lubricant that resists disintegration by the heat for as long a time as possible, and in decomposing leaves the least carbon deposit, will give the best result in thorough and efficient lubrication of the piston and cylinder walls of an internal combustion engine.

The ability to reduce the quantity of carbon contained in a lubricant is the result of a long series of tests and experiments that have been made to prove a theory, but before going into the effects it will be well to understand something of the processes of refining.

The crude oil, petroleum, is placed in a retort and heated gently to drive off the more volatile elements, and these when condensed are known as rhigolene and chimogene. A higher temperature volatilizes the various grades of gasoline and kerosene, an increased heat driving off the lightest grade of lubricating oil. A further increase of temperature will volatilize the heavier oils, but as the process continues more time is required to free them, and the expense of production becomes greater. For this reason the oil manufacturers prefer to treat the residue left in the retort by other methods that separate the various grades of heavy oils and greases. While the oils that are distilled contain carbon, it is in less proportion than is found in the oils procured from the residue, and therefore the distilled oil, if the process is continued sufficiently to obtain the necessary viscosity, will be preferable to the other.

Numerous tests and experiments have been conducted on samples of the distilled oils as well as those obtained from the residue, and consisted of extended processes of filtration, each filtration resulting in the production of an oil that was considerably lighter in color than it was previously. The viscosity and burning point, as well as the other characteristics, remained unchanged. These samples of oil, in which the process of filtering had been continued until nearly all of the color was removed, were burned in comparison with samples of the same oils unfiltered. The results were of great interest, for in each case the residue of carbon was decreased, the decrease being in proportion

to the loss of color. The samples filtered to such an extent that they were nearly colorless left a residue of carbon so slight as to be negligible.

A knowledge of the fact that carbon and color in an oil are practically synonymous is of advantage in the selection of an oil, but it should not be forgotten that a thin oil will be of lighter color than a thick. The first essential is the selection of an oil that has sufficient viscosity, and of the several brands that comply with this requirement, and have a sufficiently high burning point, that of the lightest color should be chosen. On test it will be found to contain a smaller proportion of carbon, and the results from its use will therefore be better than would be obtained with an oil of darker color.

The proper viscosity for the oil is determined by the grade of iron used in making the cylinders, and in the number, fit and location of the piston rings. A very close grain iron, which takes a smooth finish, requires a thinner oil than a rougher iron, for which an oil of higher viscosity is required to maintain a tight fit. The manufacturers' hand books furnish information as to the viscosity and this should be used until experience proves that a change will be beneficial.

**RAPID INCREASE OF AMERICAN AUTO EXPORTS.**

Not only are the exports of American automobiles increasing apace, the average gain being close to fifty per cent. annually, but the average price of the cars exported is also increasing. During the month of May, 1907, 281 cars of an aggregate value of \$618,018, together with \$47,432 worth of automobile parts, were sent abroad as compared with but \$484,541 in all in the same month a year ago. While the average increase does not reach fifty per cent., many of the individual items show a gain of almost 100 per cent., such as the figures in the case of the United Kingdom, which rose from \$138,109 a year ago to \$235,751, very favorable increases also being manifest in the case of France, Italy, Mexico and British North America. The extent of the gain may be better appreciated by a comparison of the totals for the period of eleven months ending with May in the past three years, which are \$2,167,744 for 1905, \$2,957,748 for 1906 and \$4,770,187 for 1907. The detailed report follows:

**A NEW COMBINATION BALLOON-AEROPLANE.**

A flying machine which combines the principles of the dirigible balloon and the aeroplane is being experimented in New York City by Frutz H. Grawert, a German inventor. Only a small working model has made its appearance up to the present, but the inventor is convinced of the soundness of the principles of his aeronautomobile—as he has named it—and promises wonderful performances in the near future. In the model there are four cylindrical gas bags with pointed ends, the two center bags being placed side by side and the remaining pair in front and in the rear in the same plane. A light chassis is suspended under the gas bags and on the center of it is placed the motor, in the present case of clockwork, driving a propeller in the rear. The forward and rear gas bags being attached to pivoting frames, they may be moved to control the course of the machine.

**FRENCH MACHINE FOR TESTING TIRE FABRICS.**

Notwithstanding the enormous quantities of rubber, tissues and fibers of various kinds in daily use, mechanical appliances for testing them are singularly rare, a state of affairs in striking contrast to what pertains in other branches of the technical world. Chemical experiments have done good work in providing data for the pneumatic tire manufacturer, but good as they are in their own domain they are altogether insufficient in that they have no relationship with the mechanical oscillations which a tire fabric has to undergo in actual use. The only method of scientifically testing tire fabrics so as to reveal the actual working strains they are able to support is by means of a dynamometer.

A machine for this purpose has been constructed by a French engineer, consisting, as will be seen from the illustration, of a solid castiron table (*p*) with its upper surface planed smooth and standing on two stout legs. On the table are to be found the two principal organs of the dynamometer, the apparatus for producing the efforts and the apparatus for measuring them.

For the recording instruments the inventor has abandoned cumbersome balance levers in favor of a special steel spring, which is equally accurate. In the P. B. dynamometer the spring *a* is mounted on a shaft bearing at one end the jaws *e* for holding the material to be tested, and, secured between a couple of nuts, the finger *b* operating a rack *j* and meshing with a vertical

PLAN OF P. B. DYNAMOMETER FOR TESTING TIRE FABRICS.

pinion *k*. In the axis of this pinion is fixed a needle *l* moving in front of a graduated scale *m*. On the breakage of the material under test the spring recoils, but leaves the needle motionless, thus the charge at which rupture took place can always be read. The value of an instrument of this nature depending entirely on its accuracy, the inventor has incorporated a special apparatus by which its veracity can be tested, and which is the subject of a separate patent.

The oscillating portion of the apparatus consists of two pieces, *g* and *o*, which may be attached to or released from the table at pleasure. To the lower portion of *o* is attached a connecting rod *q*, operated by an eccentric. The two slides being free, and the machine put in motion, a series of tractional efforts can be brought to bear on the material under test. Power is applied by means of a motor connected to one of the three pulleys on the driving shaft operating the eccentric through a worm gear.

The material to be tested is secured by the two jaws *e* and *f*, as shown in Fig. 1. The jaw *f* is united to a slide *g*, which in turn is connected to *o* by means of the screw *n*. By means of a horizontal flywheel and bevel gears, a simple tractional effort is applied to the fabric. Tractional tests at various temperatures, plasticity tests, cutting tests and testing of fabrics under rapidly repeated pulling strains can be carried out on the P. B. dynamometer, data being recorded by the needle in each case. Though particular mention has been made of the use of the machine for rubber and tire fabrics, it is applicable to the whole range of tissues, cordage, paper, celluloid and other similar materials. A. D. Cillard Fils, 49 Rue des Vinaigriers, Paris, France, is the constructor of the P. B. dynamometer.

## LETTERS INTERESTING AND INSTRUCTIVE

### Why Are Two-cycle Crankcases So Small?

Editor THE AUTOMOBILE:

[812.]—I am an interested follower of developments in the automobile, and have often wondered why the two-cycle engine has not come in for more attention at the hands of automobile builders, if it is all that some of its ardent advocates claim for it. However, this is neither here nor there; I am more or less familiar with the principles on which both the four and two-cycle types of motor operate, though I have never had much opportunity to inspect models of the latter very closely. But I have noticed that the two-cycle motor is made with a very queer looking form of crankcase, as compared with the four-cycle, and would like to know the reason for this. I saw a four-cylinder, two-cycle recently, and it seemed as if each cylinder were provided with a separate crankcase of its own. I would like to ask if this is the case, and why?

Chillicothe, O.

Two-cycle motors as at present used are designed to use crankcase compression—that is, the charge is drawn directly into the crankcase on the upstroke of the piston, through a port in the case of what is known as the three-port type, and through a check valve in a two-port engine, now not very much used. On the downstroke of the piston the charge then in the crankcase is compressed to four or five pounds to the square inch, and just at the moment it reaches its maximum compression the inlet port in the side of the cylinder is uncovered by the descending piston and the charge rushes through a by-pass into the combustion chamber, being there again compressed by the next upward stroke, which forms the regular compression portion of the cycle in this type of motor.

It will be plain from this that in a multi-cylinder two-cycle engine, each cylinder is really an independent unit, except, of course, that the same carbureter supplies the mixture for all. And it will also be evident that in order to obtain the necessary compression the size of the crankcase must be restricted in order that its volume may not greatly exceed that of the combustion chamber of its cylinder. The necessity for making the crankcase small as well as for maintaining the section of it corresponding to each cylinder, air tight, accounts for the peculiar shape of this essential you have noticed on two-cycle motors, as compared with four-cycle motors in which no such special conditions exist.

### Has an Original Idea for a Change Speed Gear.

Editor THE AUTOMOBILE:

[813.]—I am a reader of "The Automobile" and would like a little information on transmission. I have an idea of a transmission where the gears always stay in mesh and do not need to be shifted, as it works automatically. I am a mechanic and have followed automobiles for the past five years, and have never seen or heard of anything like mine. Can you give me any information about this? If my idea is original, I would like to have it patented.

Pittsburg, Pa.

G. C. P. M.

Without having further particulars as to the details of your invention we can naturally not give you a very definite reply regarding its originality or its value for use on automobiles. Under the circumstances, the only information that we can give you is that quite a number of change speed mechanisms, usually termed "transmissions," though somewhat erroneously, as the transmission includes a number of other essentials, in which the gears are constantly in mesh, have been invented and patented and some of them are in successful use on American automobiles today. With a few exceptions they have not proved entirely successful and the type most generally used not only calls for the sliding of the pinions, but also their shifting by hand. However, an automatically operating device of this kind was recently brought out in England, where it created quite a stir. For full particulars write the *Autocar*, London, requesting that one of the back numbers containing this description be forwarded to you. This is the only automatic type we know of.

### Who Was Right—Motorman or Motorcyclist?

Editor THE AUTOMOBILE:

[814.]—I have noticed in a recent issue of "The Automobile" a discussion of trolley car and automobile accidents illustrated with a number of diagrams. Enclosed you will find a sketch depicting the circumstances connected with an accident that happened to me on the 22d st. in Rye, New York. As will be plain from this the situation was that of an intersecting cross street on which there was a trolley road running at right angle to the street that I was on, but making a curve into it at the corner I had to pass. I was riding along at an ordinary rate of speed and when I reached the spot indicated by the cross in the lower left-hand corner, I saw the trolley car, which was then in the position marked by the cross in the upper right-hand corner, and traveling in the direction shown by the arrow, or directly across my path. I blew my horn several times and attracted the attention of the motorman, and seeing that he was looking at me I continued on, thinking that he would stop at the corner before taking the curve in order to let me pass, or else swing completely round the curve so that I could pass on the right-hand side of the car, but instead of doing either he came to a dead stop right on the curve, as

DIAGRAM SHOWING RELATIVE POSITIONS.

shown by the drawing, thus completely blocking my path. I was then going too fast to be able to take the turn at the right into the cross street, and was compelled to run straight into the curb on the opposite side, barely managing to go between the telegraph pole and tree marked by the two small circles—a space scarcely three feet in width, completely wrecking my machine, but fortunately escaping with a few bruises. I owe my escape to the good material in my machine, which is an Indian, for had the front wheel or the forks buckled when I struck the curb I would have been crushed against either the pole or the tree. I hope this may interest some of the readers of your valuable paper, and would like to ask you, was the motorman or myself to blame under the circumstances? An answer published through your "Letters Interesting and Instructive" department will be appreciated.

Rye, New York.

E. H. GALLAWAY.

There can be no doubt in the mind of anyone who reads your account of the accident from which you were so fortunate as to escape with nothing more serious than a few bruises that you were clearly to blame. While you state that you were riding at an ordinary rate of speed when you first discerned the trolley car, this hardly corresponds with your later statement that you were going too fast to make the turn into the side street when you found the road ahead blocked by the unexpected stopping of the car on the curve. In other words, your machine was certainly not within control, considering the circumstances, as otherwise you would doubtless have been able to choose a somewhat less risky spot than the one you managed to squeeze between on striking the curb. If it was impossible for you to turn the machine at any greater angle than that indicated by the dotted

line which describes your course from the time you steered to the right slightly to avoid the car until you landed up in the field, your rate of travel must clearly have been such as to be characterized as highly dangerous under such conditions. Of course, it is far easier to analyze such situations when they are presented in black and white and time is not pressing; in reality quick action is absolutely necessary and what proves to have been poor judgment on mature thought did not appear so when an immediate decision was necessary. Under the circumstances we should think it natural to cross the tracks at the left to avoid the car before it reached the curve unless other traffic interfered, or if the speed were not highly excessive it would seem as if the easiest road to safety would have been a turn to the left after passing the tail end of the car, as shown by your sketch. There is always a great element of uncertainty about every situation of this kind, in that you can never depend upon what the other fellow is going to do, so that prudence and common sense would naturally dictate a rate of speed at which the machine could instantly be brought to a halt without damage either to it or its rider. The verdict must be against you and the lesson should prove one not easily forgotten.

### An Expedient to Save Lubricating Oil.

Editor THE AUTOMOBILE:

[815.]—I have noticed in an article which recently appeared in "The Automobile" a reference to the waste of lubricating oil by the average automobilist, and particularly by the professional chauffeur. As stated therein, most of this waste takes the form of leakage from the crankcase as well as the gear-set housing, and the extent to which it takes place may readily be learned by looking at the pavement or road wherever automobiles have been standing for any length of time.

It seems strange that this practise, or rather neglect, should be so general and still be noticed by so few people, for I must admit that though I have been an autolst for four years past, I never observed it particularly. Recently, however, I found that the motor of my old car seemed to be taking an excessive amount of lubricating oil, and I asked a local machinist the reason, but the only satisfaction I got was that the "motor was old," and consequently needed more oil. It has always been my impression that a motor once well worn in reality needs less oil than one that is comparatively new. I continued to throw lubricating oil away in rather generous quantities until the article referred to came to my attention, and I found that, as mentioned therein, most of the oil was being thrown out through the crankcase joints. I presume I would have noticed this sooner had I made a habit of cleaning the motor myself. I want to remedy this as well as a similar defect in the transmission case, and would like to know if any special material is necessary as a packing, and what the method of procedure is.

LUBRICANT.

Springfield, O.

There is a wide range of materials from which to cut suitable gaskets for this purpose, such as asbestos, sheet rubber, felt and the like, even manila or heavy wrapping paper having been employed for the purpose. It is easiest to make a tight joint in an old crankcase with a special rubber gasket, but the life of the rubber is cut short by its being constantly wet with lubricating oil, at the same time being subjected to the heat of the motor, which is very destructive of this material. However, a good rubber gasket would last a season out with little trouble unless the motor runs very warm. Sheet asbestos or mineral wool felted together are better materials so far as durability is concerned. Whatever the material employed, a gasket the width of the faces of the joint should be cut, making careful allowance for any bolt holes or other obstructions so that the gasket fits perfectly and lies flat in place without stretching or puckering. The only point on which care is necessary in its application is to have the remains of the old gasket entirely removed and to put the new one in place without tearing, especially if it be of asbestos.

### Some Queries Concerning Dry Cells.

Editor THE AUTOMOBILE:

[814.]—I would like to ask a few questions in regard to the use of dry cell batteries. I have a Ford runabout, on which I use dry cells exclusively. I use six cells to the set, battery box holding two sets. After running on these until they are a little over half

exhausted, or say 6 to 8 amperes remaining to each cell, I find that my engine will not run up to satisfactory speed, and also mis-fires very often. Is it in any way detrimental to change my wiring so as to throw all the 12 batteries on one set?

I have been doing this, and find that I get very good ignition service from the 12 cells.

On a new set of six dry cells I find that there is a total of about 12 amperes on an average. To wire up enough partly used cells to bring the total amperage up to the same amount, would I get as good service from these as I would from the new ones? If wiring these partly used cells should be discontinued, at what amperage should the cells be discarded for new ones? Any information on this subject will be appreciated.

W. A. GRAY.

Coleman, Tex.

It will do no harm to connect the two sets of six cells each in series-multiple—that is, so that the voltage of the twelve-cell battery still remains the same but the amperage or current is doubled. With your present arrangement the coil receives the amperage of one cell and the voltage of six, regardless of which set is being used; by altering the connections as mentioned after the cells have become partly exhausted, the amperage would be that of two cells, but as their output has already been practically halved by usage the result would be practically the same as using one fresh set. In fact, it is quite customary to wire up two sets of dry cells so that either may be used separately or both in series-multiple, the necessary connections being explained and illustrated in an article entitled "The Essential Elements of Electric Ignition," which appeared in THE AUTOMOBILE of the issue of February 21 last.

The service obtained from two sets of partly used cells wired up as mentioned will probably be found to be superior to that from a single set of new cells, in that the former will continue to give a uniform current output for a longer period, as they will not deteriorate quite so rapidly, due to the fact that the demand upon them for current is distributed over a larger number. Dry cells should be discarded when they no longer give satisfactory service, i. e., the motor cannot be run steadily for any length of time without missing and cannot be speeded up, though it is always well to investigate other causes of ignition trouble before deciding that the battery is at fault. It is poor practise to frequently use an ammeter on dry cells, as it simply wastes their energy to no purpose; if more attention were given to testing the amount of current being consumed by the coils and the efficiency of the contacts of the timer, there would be less so-called battery trouble and dry cells would be found to last a great deal longer.

### ANOTHER TIP FOR THE BENEFIT OF No. 779.

Editor THE AUTOMOBILE:

[817.]—If you will kindly allow me the space, would like to give my experience with the same trouble as No. 779. In all the engines, both automobile and marine, that have given this trouble, that have come under my notice, it has been from the same cause, i. e. too weak inlet valve springs; which allow the valve to chatter on its seat upon closing, instead of going shut and staying shut—a condition that obtains a great deal more frequently than is likely to be believed unless one starts to investigate.

In my own little machine with automatic inlet valve, the back-firing through the carbureter got so bad on one occasion that the engine stopped. I removed the spring and simply stretched it a little, put it back, and the engine started off O. K., and has been running ever since without any sign of back-firing.

Horizontal valves are much more prone to this trouble, whether automatic or mechanical, than vertical ones, especially after the stems have become worn a little through use.

Hoping that this will give Mr. J. C. Moore a "tip" as to a remedy for his trouble,

H. W. CYRUS.

Astoria, Ore.

### HOW CAN THESE LAMPS BE KEPT LIGHTED?

Editor THE AUTOMOBILE:

[818.]—I have been running a 1907 Oldsmobile for some time, equipped with No. 626 Solar lamps. These lamps I find impossible to keep lighted, as the slightest jar puts them out, and I have found nobody as yet who can tell me a remedy. I keep them thoroughly cleaned, but still they go out. I never have trouble with the tall lamp, nor the gas lamps. Will you be so kind as to suggest a remedy, through your query department, and oblige one in the dark?

W. G. WOOD.

Berkeley, Cal.

# WREAKING REVENGE ON THE AUTOMOBILE

By W. F. BRADLEY.

ONE may be as devoid of horsemanship as John Gilpin or as innocent on matters of equine anatomy as the average deep-sea sailor and yet be fully aware that the ways of the horse dealer are wonderful and fearful. With a few centuries of experience behind him, the art of transforming in a few seconds a noble beast into a wretched hack, or of temporarily rejuvenating him so skilfully that only the expert can find traces of the operation has had time to reach its highest development.

But the horse world is not the only one in which tricks play an important part. Specialists in every branch of sport can relate similar stories of cunning and knavery. The automobile, young as it is, has not escaped the evil. Visit the headquarters of any racing team on the eve of an important contest and note with what care the machines are guarded. Watched by keen eyes all day and guarded through the darkness as tenderly as a sick child, it is evident that some terror by night or pestilence that goeth forth at noonday is feared. The terrors are not imaginary, but have a strong personality in the unscrupulous rival who would stay at nothing to enhance his own chance of victory.

## Knavery in the Cross-country Race Days.

In the early days in Europe, when races were held across country from town to town, attempts to cripple a rival's machine were comparatively easy of execution and consequently of frequent occurrence. Five minutes alone with the machine in the shed where it was stored for the night and a trained hand could so weaken a powerful speed monster that it would collapse a few hours later. One of the most skilled European drivers discovered on taking over his machine on the morning of the third day that his brakes had been tampered with and that the clutch was no longer performing its accustomed duties. An hour's vigorous work and all was put in order again and the race finally won. Had the evildoer had more time or the driver been less skilled another tale might have been told. Under present conditions with races on guarded courses, begun and finished the same day, such practices are almost impossible. Before the race only picked men in whom every confidence can be placed are allowed to handle the machines, and during the event attempts at fraud are utterly out of the question. The manner in which the racers engaged in the French Grand Prix last year were guarded between the first and second day's event shows that unscrupulousness was believed to still exist. Locked in the center of a large field, with guardians watching over them and troops patrolling the entire enclosure, the precautions resembled those observed in connection with a royal palace.

## When the Private Automobilist Is the Victim.

Racing is not the only domain in which the upscrupulous automobilist will display his mischievous qualities. Your private chauffeur may have angry feelings because of a sudden dismissal, and before leaving administers a dose of medicine to your valuable machine, the effects of which will only be felt when the man is out of your reach. Only a few months ago a prominent British constructor was loud in his accusations of French workmen, who, he declared, had tampered with the gear box of a machine sent across the Channel to receive a French body. How much truth and how much international jealousy existed in the matter has never been determined.

Pouring water in the gasoline is but a crude method of wreaking vengeance on a rival and one that is now abandoned to the greenhorn. A little sulphuric acid put into the cylinders through the pet cock is one of the simplest and at the same time most certain methods of placing a car out of service. In a few minutes the acid has done its deadly work and the owner may spend hours in vain conjectures as to the cause of a sudden loss of

compression. Motorcycles with exhaust at the end of the strokes are an easy prey of the unscrupulous rival with a syringe loaded with sulphuric acid. A handful of emery powder dropped in the lubricating oil has apparently no ill effects on the health of the machine, but in an hour or two there will be play in every part and damage done which can only be remedied by a thorough overhauling of the machine.

## Not Dangerous, but Exceedingly Annoying Fakes.

There are a score of methods by which a revengeful chauffeur can immobilize an automobile with little fear of detection and with still less danger of criminal prosecution; without doing any material injury to the machine he can give to his rival hours of weary searching. A small wooden plug pushed into the gasoline supply pipe will cause a breakdown which will disgust a driver with Job-like patience. Even more annoying is a short circuit caused by carefully cutting the insulation, severing the wire and closing all up again so as to avoid detection. An experienced driver, victim of such a scheme, knows immediately that he has a short circuit, but long experience will not remove the necessity of examining every inch of the wiring and searching with minute patience for hours before the fatal spot is discovered. Another easy one is to slacken the clutch; at first no ill effects are experienced, but immediately a grade of any difficulty is attempted trouble begins. A dozen balls or a couple of bolts dropped into the gear box reduce the most magnificent set of gears to a ragged condition before the operator of the car has time to realize that he is the victim of an evildoer.

## Procedures of the Deep-Dyed Villain.

More to be feared is the revengeful fiend who, not content with disabling a machine, will place the lives of the occupants in danger. With a chisel and a hammer the cables operating the brakes will be partly severed. The first time it is necessary to use them, perhaps at a critical moment, they snap like a violin cord. More dangerous still are attacks on the steering gear; the withdrawal of a cotter pin, the slackening of a nut and the villainous deed is done. One case at least is on record of the steering gear having been filed. After the accident, which, fortunately, had no serious results, the traces of the criminal tool were readily discovered. In the same category may be classed attentions to the road wheels which transform these organs into veritable death traps.

Fortunately there is a large amount of amour propre among the corporation of chauffeurs, and for one unkind action a thousand helpful deeds could be recorded. The average man hates to injure a machine as much as he dislikes to inflict injury on an animal. Where, however, it is feared that the knave has been at work an acquaintance with the methods he is most likely to adopt is exceedingly useful and may be the cause of preventing much annoyance, costly repairs, or even of preserving human life.

## A. A. A. NATIONAL LAW WOULD PREVENT THIS.

ATLANTA, GA., July 8.—The Chattanooga autoists who have been made defendants in the suits for alleged violations of the automobile laws of Catoosa County, Ga., will probably require requisition papers before they will go to Ringgold and make bond for their appearance in the superior court of Catoosa County next August. It is understood that Sheriff Pendleton's mission to Chattanooga was futile. He tried to persuade the defendants to go to Ringgold and make bond, but they are said to have told him they would do nothing of the kind. They insisted that they have violated no law and that the Georgia officers have been doing a land-office business in a fee-grabbing crusade. It is understood that the autoists will employ counsel and test the validity of the action of the officers.

CANADA has taken up the automobile in earnest and shortly is to make a determined bid for her share of the world's trade in cars, the recent show held in Montreal having demonstrated that makers over the border are waking up to the possibilities of automobile manufacture. One of the exhibits that attracted a great deal of favorable attention was that of the Comet Company, Ltd., which has been incorporated to make automobiles with a capital of \$250,000. A factory has already been erected in Montreal and actual production commenced, so that for 1908 the Comet cars will be a strong factor in the Canadian market. The plant consists of a two-story building affording 75,000 square feet of floor space, and it is the intention of the company to expand considerably in the near future.

The Comet car, of which there will be two models—a 24-horsepower four-cylinder car and a 40-horsepower six-cylinder car for 1908—is the work of Berne Nadall, who has been identified with automobiling for the past decade, having been one of the charter

members of the now Royal Automobile Club, and who is also known as the inventor of the Nadall detachable tire. For the present most of the material is being imported from the Continent and is of the grade used in some of the best known European makes of cars, but it is the intention to eventually make practically everything that goes into the car, even including such parts as frames, springs, wheels and the like, generally considered the work of the specialist by even the largest builders here.

The leading model for 1908 will naturally be the 40-horsepower six-cylinder car, the cylinders of which are to have a bore of 100 mm. and a stroke of 120 mm. The cylinders are independent and the castings are imported from France in the rough. The valves are oppositely disposed and mechanically operated and the motor is designed to give its normal output at a speed of 1,000 r. p. m. Chrome-nickel steel is employed for the crankshaft, which is cut from a solid billet and is supported on large French phosphor bronze bearings. The continuous circulating system of lubrication, using the crankshaft as a well and with a single sight feed on the dash, is employed, due to its simplicity and great efficiency, while the ignition is of the high tension type, employing a Bassé-Michel magneto on one side and a synchronous system, using a single non-vibrating coil on the other, fed by a set of accumulators. A gear-driven pump feeding a tubular fin type of radiator, with honeycomb front and supplemented by a belt-driven fan running on ball bearings, constitutes the cooling system, fan-shaped spokes also being cast in the flywheel. The carbureter is patterned after French standards and is water-jacketed.

The Hele-Shaw multiple disc clutch, formed of alternate bronze and steel members, is the first step in the transmission of the power, while the change-speed gear is of the sliding type and selective operation, providing four speeds forward and the usual *marche arrière*, the direct being on the third speed, while the fourth is geared about 15 per cent. higher. All the pinions are of chrome-nickel steel, as are the gear shafts, which are supported on Hoffman annular type ball bearings. Final drive is by propeller shaft. The foundation of the chassis consists of a pressed steel frame of the standard channel section and of the latest French type; chrome-nickel steel is the material used and the frame as a whole is thoroughly reinforced. It is supported on the standard type of semi-elliptic springs, measuring 40 inches front and about 50 inches rear, supplied by Prunelle et Cie., while the rear axle is from Malicet et Blin, all bearings in the latter being of the M. & B. annular ball type. Thirty-six-inch wheels are fitted and are equipped with 920 by 120 mm. tires rear and 105 mm. front, corresponding to 4 3-4 by 4 1-4 inches. An innovation is to be found in the fuel tank, which in addition to being divided into two compartments, one of which carries 15 gallons of gasoline and the other a two-gallon reserve supply, also has compartments for a gallon of lubricating oil and a gallon of kerosene.

From the foregoing it is evident that the makers in planning their car have sought to come as near to the production of a high-class standard design of car as it is possible to make.

INLET SIDE OF COMET FOUR-CYLINDER CAR SHOWING MAGNETO.

VIEW FROM EXHAUST SIDE OF MOTOR SHOWING OIL RESERVOIR.

known makers. They are all mechanically operated from two separate camshafts. The pistons are cast from the same material as the cylinders; they are fitted with three compression rings and an oil ring placed at the bottom, and in finishing are ground parallel with the bottom ring, with a slight taper at the head to compensate for the greater expansion at this point due to the fact that it comes in direct contact with the heat of the explosion. The heads of the pistons are made dome-shaped. Connecting rods are of drop-forged nickel steel and at the big ends are fitted with split bushings and babbitt bearings made adjustable and firmly held by studs and castellated nuts. The crankshaft is turned from a solid billet of chrome-nickel steel and its journals are ground to .003 inch in finishing; it is supported on five babbitt bearings of generous size. An automatic self-compensating carbureter of ample size and modern design constitutes the gas-producing device. In order to provide against the results of carelessness in winter, the sides of the water jackets of each cylinder are enclosed by thin aluminum plates, thus forming an effective provision against damage through freezing. Starting is usually accomplished from the seat on the Atwater-Kent system, but to facilitate the operation of cranking a compression release is provided, the lever of which is placed on the dash in an accessible position.

The same painstaking attention that has been paid to motor design and construction detail has likewise been devoted to making the equipment of the power plant as fine as can be procured, which means a great deal in the service rendered by a car, as more than 90 per cent. of the trouble experienced with an automobile arises from petty defections that could be avoided at the outset by the maker. This is particularly noticeable in the case of the ignition; a duplicate set has been provided throughout, one side consisting of an Atwater-Kent single coil and distributor system to be used in connection with a set of accumulators, while the other is an entirely self-contained and independent set in the shape of a Simms-Bosch high-tension magneto. There are two sets of plugs, so that both systems are independent, those for the former being mounted in the center of the cylinder head, while those used with the magneto are mounted directly over the inlet valves, as this system generally comes in for the greatest amount of use.

A noticeable feature of merit about the power plant of the Meteor is the manner of its suspension; the motor itself and the change-speed gear and clutch really form an integral unit, which is held in the frame as such by what is termed a diamond suspension, giving six points of support—in other words, a double three-point suspension, which on account of the perfect division and distribution of the weight gives great flexibility, and this in connection with the integral feature of the combined power plant and transmission makes disalignment of any of the components of these parts a practical impossibility.

One of the special features of the Meteor is to be found in the change-speed gear of the car. It is a matter of common knowledge that the practise of sliding moving gears into mesh

"WISDOM seldom comes except by experience, and it is the possession of that experience that leads us to thus preface our catalogue," say the makers of the Meteor, the Meteor Automobile Works, Bettendorf, Ia., so that while the Meteor is a new bidder for favor in the American market, it is not an experiment in any sense of the word, but an example of good standard design that is the result of ripe experience in building automobiles as well as knowing how not to build them, gleaned by close observation of the trend of construction in the past half decade or more in this country and abroad.

For the present but one chassis is being built, though three models are listed, a regulation touring car, a runabout with rumble seat and a runabout with turtle deck. The motor cylinders are cast from a special grade of close-grained iron imported from England for the purpose and each is an independent unit. The valves are oppositely disposed and are located in outboard valve chambers in accordance with the practise of several well-

SIMPLE TYPE OF INLET MANIFOLD EMPLOYED ON THE METEOR.

VIEW OF THE METEOR CAR FROM THE OPERATOR'S SIDE.

goes counter to all principles of mechanics, both practical and theoretical, but, like many another thing, usage has demonstrated that theory was not more than half right and the gear set of this type has survived and been greatly improved. The makers of the Meteor, however, claim that their change-speed gear is built on absolutely correct mechanical principles and is, moreover, the only one of its kind. It provides four speeds forward, with two reverse, and is of the positive clutch, selective type, all pinions of the entire set being constantly in mesh and when on the direct drive all are idle. Both the main and jackshaft are supported on imported Hess-Bright ball bearings of generous dimensions to transmit the power. Though not intended to be shifted into and out of mesh, the same materials and the same care have been employed in the making of the pinions of the gear-set, as if they were to be used for this strenuous service, so that the makers absolutely guarantee the life of the pinions for a year and will replace them should they break under any conditions of driving, short of a wreck. The clutch is also a special design consisting of a single aluminum friction disc, which when fully engaged is designed to be locked positively at four points to the flywheel itself.

The foundation of the chassis consists of the usual pressed steel frame, carried, in this instance, on Timken roller-bearing front and rear axles, drive being by propeller shaft. Thirty-six-inch wheels are fitted and are equipped with four-inch tires on the front and four and a half on the rear, Continentals forming the regular equipment of the car. Two sets of brakes are fitted, centered in special drums on the rear wheels, in accordance with the highest standard practise where this essential is concerned, but a *départure* has been made by constituting the external contracting set as the running brake and also by interconnecting it with the clutch. The internal expanding set forms the emergency brake and is operated by the usual hand lever at the side. The bodies fitted are of an attractive straight-line type and are built under the supervision of a bodymaker formerly connected with one of the large Continental works.

HAYNES GLIDDEN CAR, AND APPERSON "JACKRABBIT" ENJOYING A FRIENDLY BRUSH ON THE ROAD.

## THE AUTOMOBILE CALENDAR.

## AMERICAN.

## Shows and Meetings.

- Oct. 31-Nov. 7.—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.  
 Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.  
 Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon, C. R. Mabley, secretary and manager.

## Races, Hill-Climbs, etc.

- July 13.....—Rochester, N. Y., Gymkhana Sports, Genesee Valley Park, Rochester Automobile Club.  
 July 13.....—Chicago, Race Meet for the Entertainment of the Glidden Tourists, Chicago Automobile Club.  
 July 25-28.....—Providence, R. I., Annual Meet of the Federation of American Motorcyclists.  
 July 27.....—Schooley Mountain Hill Climb, near German Valley, N. J. W. J. Morgan, manager, Bretton Hall, New York City.  
 Aug. 1.....—Algonquin, Ill., Hill Climb, Chicago Motor Club and Chicago Automobile Trade Association.  
 Aug. 5-10.....—Atlantic City, N. J., Automobile Carnival, Atlantic City Automobile Club.  
 Aug. 9-10.....—New York City, Brighton Beach Track, 24-hour Automobile Race, United States Motor Racing Association.  
 Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.  
 Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.  
 Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.  
 Oct. 19.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aeroclub of America.

## Motor Boat Races.

- July 20.....—New York to Marblehead, Mass., 270-mile Motor Boat Race, New Rochelle Yacht Club.  
 Aug. 13-15.....—Chippewa Bay, St. Lawrence River, Gold Challenge Cup Race, American Power Boat Ass'n.  
 Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.  
 Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

## Shows.

- Sept. 28-Oct. 7.—Denmark, Copenhagen International Automobile Show.  
 Nov. 11-23.....—London, Olympia Motor Show.  
 Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.

## Races, Hill-Climbs, etc.

- July 15-18.....—Ostend Week, Record Trials, Automobile Club of Belgium.  
 July 25.....—Ardennes Circuit, Belgium (German rules).  
 July 26.....—Ardennes Circuit, Belgium (Tourists).  
 July 27.....—Ardennes Circuit, Belgium (Grand Prix rules).  
 July 31-Aug. 8...—Belgium Regularity Contest for Touring Cars, A. C. of Belgium.  
 Aug. 1-7.....—Criterium of France, 1,750 Miles Touring Competition and 250-mile Race for the Press Cup, A. C. of France.  
 Aug. 3.....—Isle of Wight, British International Cup, Motor Boat Race.  
 Aug. 11-29.....—France, Coupe de Auvergne.  
 Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup, A. C. of Italy.  
 Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.  
 Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.  
 Oct. 13.....—France, near Paris, Dourdan Kilometer Speed Tests.  
 Oct. 20.....—France, Gailion Hill Climb.  
 Nov. 1-15.....—France, Volturette Contest near Paris.  
 July 14, 1908....—Paris to London, Aerial Race.

## CALIFORNIA'S WIDESPREAD INTEREST IN THE AUTO

By FREDERICK PABST.

LOS ANGELES, CAL., July 6.—Eleven thousand automobiles are now whirling over the roads of California, and each day the Secretary of State at Sacramento receives a bunch of new applications for numbers. Before the summer is over there will be over 15,000 machines in this State. Several months ago San Francisco and Los Angeles had about 3,000 cars each, but during the last couple of months the "City of the Angels" has fallen behind to a slight extent and now has about 4,000 cars to 4,500 in the northern city. This is due to the terrific condition of the streets in the earthquake town, which has caused the cars to be hammered to pieces. These conditions are such that a person must see and experience to fully realize them. But as the situation there makes it almost a necessity for a business man to have an automobile the business should continue good.

Business has been unusually healthy in Los Angeles, and, despite the fact that already seventy-six different makes are repre-

autos will be found to greatly outnumber any other transportation vehicle. Not only are there more machines owned here than in any other city in proportion to its population, but there are more cars in rental and all are making good money.

### Los Angeles Has a Strong Trade Organization.

The dealers of Los Angeles have one of the best organized and most successful dealers' associations in the country. It is in its third year and has accomplished many things of benefit to the autoists of the entire State. Nothing but the efforts of this organization prevented the passage of two very foolish bills by the State Legislature. One was to force the owners to equip machines with straps in the tonneau. Another closed certain mountain roads to autos. A red-hot protest from the local dealers was followed by the killing of both of these bills.

The organization has also pulled off many successful hill

MRS. J. C. BROADIE, OF OAKLAND, COMPETING IN THE MITCHELL MOTOR CAR COMPANY'S CONTEST AT SAN JOSE, JUNE 7

sented in this city, others are entering the field constantly, and this season should see practically every car of any standing in the Southern California field.

### Importance of California Field Now Recognized.

It has not been until lately that the manufacturers have come to recognize the importance of the California field. Anything seemed to have first call over California in the matter of deliveries, and as a result the companies which saw the opening and shot cars into this field disposed of many times as many as those on which shipments were slow. The automobile business in every branch is not only in a healthy condition now, but it should continue so. The city is growing to a remarkable extent, and a majority of the people who come to Los Angeles to live come with some money. And once here the spirit is in the air and the person who never dreamed of owning an automobile will soon be reading the automobile papers and haunting auto row.

California is blessed with autoing the year round, and when one person in about every sixty owns an automobile unpopular indeed is the man or woman who doesn't number an owner among his or her friends. Los Angeles can truly be said to be automobile mad. At any hour of the day or night on the streets

climbs, race meets and endurance runs. Its first was a couple of years ago to Santa Barbara. Over fifty cars competed, and, considering the hardships of the road and the fact that this was the first event of the kind, the run was highly successful. Two years ago the Pasadena-Altadena hill climb was inaugurated for February 22 and was one of the best events of the kind held in the country.

One year ago the endurance run "Round the Kite" was held and took rank at that time as the largest event in this country. One hundred and six cars entered and 101 started. The first day's trip was through the beautiful valley east of Los Angeles, passing through the towns of Pasadena, Monrovia, Pomona, Claremont, Ontario, San Bernardino and Redlands to Riverside, where the night was spent. The next day's run was through the Santa Ana canyon to Los Angeles. This was followed by a second Altadena hill climb, and a few weeks ago a successful race meet was pulled off at Agricultural Park. Last January this Association gave an automobile show which was voted one of the most artistic in the country.

W. K. Cowan was the first president. He is the local Rambler agent. A. J. Smith, representing the Elmore, was the next president, and at a recent meeting J. W. Willcox, of the Maxwell-

Briscoe-Willcox Company, was elected. Leon T. Shettler, the Reo representative, has been secretary for two terms. He is a hustler and has been a leader in all the Association's successful undertakings.

#### An Air of Prosperity Exists on the Row.

There is an air of prosperity through automobile row. The old dealers are doing well and the new firms are selling an unusually large number of machines. Among the tire and supply, men business is phenomenal.

The electricians have had a boom here during the last year. The Electrical Construction Company is doing most of this business, having the agency for the Waverly, Baker and Columbus. B. L. Brown, formerly of Pittsburg and St. Louis, is responsible for the big electric business. He took hold when this branch of the business was not being pushed and has done wonders.

L. T. Shettler has had a big year with the Reo. He has the best organized selling force in the State, having made the boast that practically every live sub-agent in the State was selling Reos as fast as he could get them.

The Western Motor Car Company, with a big line, Packard, Thomas, Stevens-Duryea, and Buicks, has done an enormous business. The Packards were sold almost before the first cars reached here, and the number of Buicks sold is past the hundred mark. The two Thomas models have also been in demand.

The H. O. Harrison Company, with the Peerless and Oldsmobile, has placed fifty cars on the market. The allotments for both makes are almost exhausted.

The Auto Vehicle Company, makers of the Tourist, are many orders behind now, with the factory working day and night to catch up. This company is building a 22 and a 40-horsepower touring car of modern construction.

W. K. Cowan, who handles nothing but Ramblers, is the veteran of all dealers. He has been building up a business which sticks to the Rambler and can see nothing else.

D. M. Lee, with the Cadillac, has been handicapped by late arrival of cars, but he has placed many of the sturdy little single cylinder machines and has orders booked three months ahead for the G and H models. The single cylinder car won a host of friends by making a non-stop run from Los Angeles to San Francisco and return. The 30-horsepower car also won a fifty-mile race in good time recently.

A. J. Smith has sold his entire allotment of four-cylinder Elmore's and has but few of the three-cylinder variety remaining. His car recently won a fifty-mile track race here.

The Greer-Robbins Company, agents for the Mitchell, has recently moved into a large new garage and salesroom. The company has twenty-one orders unfilled.

Captain H. D. Ryus had orders taken for fifteen White steamers before a single car reached Los Angeles. The week of the arrival of the first steamer of the new type six additional cars were sold. The White Garage Company has also done well with the Pope-Hartford and Pope-Toledo.

The Success Automobile Company has the Locomobile and Winton, and has suffered by late shipments. This company is now offering the Panhard, Simplex, Mercedes, Renault and the Italian Isotta Fraschini car.

E. J. Bennett has made the Wayne popular in Southern California.

The Maxwell Company has been unable to keep up with the demand, and all other makes report flourishing business.

#### Supply Business Has Been Phenomenal.

With all these automobiles being sold, the supply business has naturally been phenomenal. W. D. Newerf, who has the Good-year tire for the Coast, has just placed an order for \$60,000 worth of tires and will establish agencies in Portland, Seattle, Fresno, San Diego, San Francisco, Honolulu and other towns large enough to support the business.

The Western Rubber Company, with Guy West at the head of the management, is doing more with the popular G and J tire than any Western company has ever done before.

The Chanslor-Lyon Company is probably doing the largest accessory business in the city. This firm has the sole agency for a large line and also handles the Diamond tires.

The E. A. Featherstone Company has the largest supply house in the city and has a large following. E. A. Featherstone is the head of a company which recently purchased the interests of Heineman and Pearson.

John T. Bill has the motorcycle business all but cornered. He has sold over 100 machines during the last three months and to care for his retail and wholesale business it has been necessary to double the store room.

Eddie Helm, the manager for the Gorham Rubber Company, has had the best year the company has known. Mr. Helm has placed the Goodrich tires in an enviable position in Southern California.

The general opinion among the local dealers is that business will continue to improve from month to month. The summer may be a bit quiet, but by September things will be humming.

## WITHOUT FOOD AND GASOLINE ON GOBI DESERT

PARIS, July 2.—Adventures are coming thick and fast to contestants in the Pekin-Paris automobile race—which is no race at all, but a go-as-you-please help-one-another tour. Cormier, who cables when he can find a telegraph station, states that they are on the Gobi Desert, with Prince Borghese, on an Itala, ahead and the remainder, consisting of two De Dion Boutons, a Spyker and a Contal tricar, following on as best they can. The Tartans are the finest fellows in the world. They supply all kinds of food and furnish camels' milk—the most detestable stuff imaginable—with the agility of a bartender. When the Spyker was stranded with an empty gasoline tank they came to the rescue. Twice on the Gobi Desert the Itala sank in the morasses, and was only rescued after terrible exertions by wild Mongolians, with oxen.

On another occasion, when the Spyker had taken over a large portion of the baggage of the Contal tricar, the gasoline supply became exhausted. Cormier lent four liters, all he could spare, and when this was exhausted the party pitched their tent with one chicken, an army biscuit and a quart of water as total rations.

After twenty-four hours a Mongolian woman appeared on a camel and supplied a few drops of muddy water. By signs and by showing a rope she was made to understand that a tow was needed. Her camel, however, was insufficient to the task, dragging the car forty yards, then leaving it still deeper in the sand. The second night the party had not courage to erect the tent, and were further disheartened by a party of Mongols refusing to give help. Godard, the Spyker driver, went out alone to search for help, and after an absence of two hours came back with a troop of horsemen, who, after being paid in advance, carried a message to the nearest telegraph station and caused help to be brought. The record travel for one day across the Gobi Desert was 160 miles.

Later despatches from Cormier announce that they have crossed the Gobi and are now waiting at Ourga for the Spyker and the Contal tricar, left behind on the desert, to join them, when the complete party will commence the passage across Siberia. The last day on the desert they were able to travel 150 miles, which, over rough country without a semblance of a road, is excellent.

MACHINE USED BY THE EMULSIFIX TAR SPREADING SYSTEM.

**TAR-SPREADING EXPERIMENTS IN ENGLAND.**

LONDON, July 1.—Some experiments of great interest and importance have been carried out by the Roads Improvement Association in conjunction with the Motor Union and the R. A. C. After investigation with various deliquescent chemicals, the general opinion of road surveyors and other responsible judges inclines towards tar coating as the most satisfactory and economical preventative of dust raising. Resulting from this feeling the present competition was set on foot to test the respective merits of various machines designed to supersede the old method of tar painting the road surface by manual labor.

Seven machines were assembled on the Hownslow-Staines road near London, and before an interested crowd of officials and spectators each apparatus was set to work on separate quarter-mile sections, half the road being covered in the morning and the other portion later in the day, so as to cause no interference with the road traffic. Crude coal tar was supplied by the association to the competitors at cost price, and the general use of this material rendered subsequent observation of the results far more easy and facilitated comparison.

The first machine, Aitken's pneumatic tar sprayer, consisted of an attachment capable of being fitted to any steam wagon. The tar is heated in its tank by steam pipes and an air pump compresses air into a receiver up to a pressure of 150 pounds per square inch. When normal pressure has been reached a separate tar pump forces the heated material into the receiver until the pressure reaches 250 lbs. per square inch; the machine is then ready for use. The distributing pipes are fitted with four discharge nozzles which spray the tar in a finely diffused condition into the top layers of the road surface.

The Emulsifix machine consists mainly of a large mixing chamber into which water and tar are fed. Revolving paddles spray the mixture into an emulsified compound which is sprayed

by gravity on to the road surface. When the water has evaporated it is claimed that the finely divided tar oil will bind the surface materials together. The Laissaily system requires two separate machines, one to heat up the tar and a second or more machines to spread the heated compound. Steam generated on the heating machine warms the tar by coiled pipes to a temperature of about 212 degrees F. At this stage the delivery carts are supplied by steam pressure and the tar is afterwards sprayed by gravity onto the road in front of heavily weighted brushes which spread the tar in a thin and uniform coating. In similar manner the Tarmaciser machine brushes the heated tar into the road surface and with an additional set of brushes in front, the loose dust is removed from the track. Unfortunately this vehicle met with an accident on its way to the scene of the competition and so its performance could not be witnessed. Three Tarspra machines were tried, differing only in size. A mechanically driven pump forces the tar at 200 pounds pressure through spraying nozzles by two opposing jets which impinge to-

SECTION OF NEWTON BOULEVARD TREATED WITH TARVIA.

gether and spray the tar in finely divided state. Thwaite's machine, which completed the list, sprayed the tar in conjunction with superheated steam, the temperature of the issuing material being over 300 degrees F.

ANOTHER SECTION OF SAME ROAD NOT TREATED WITH TARVIA.

All these machines were tried later on a gravel-surfaced road and, as before, careful observation was made of the amount of tar consumed and the time taken. When a sufficient period has elapsed to indicate the relative wearing qualities of the various sections of the road, the awards of the judges will be made, first prize consisting of \$550 and a gold medal, with \$250 and silver medal for next place.

On two following days tests were made of some nine tar preparations which had been entered. The majority of these consisted of an emulsion of tar, oil and water, with the addition of caustic soda in some cases to retain moisture.

**HOW TARVIATED ROADS ARE STANDING UP.**

In the fall of 1906 numerous stretches of the famous Newton boulevard near Boston were covered with Tarvia to see the comparative effect of the winter and spring months on the surfaces treated and those not treated. The two illustrations above shown, from photographs made this spring, tell their own story of the advantages of tar treatment.

TARSPRA MACHINE, WHICH SPREADS THE TAR UNDER PRESSURE.

**Greatest Prosperity of the American Auto Industry.**

Scarcely a week passes without the recording of the fact that some builder, well known through his standing in the American industry, has found expansion imperative in order to keep pace with the demand made upon his manufacturing departments. Not that this condition is either temporary or unusual; last year saw the erection of a very large number of new buildings to already extensive plants, and the first half of the present year has been productive of a far greater number. But the most significant fact to be observed in this general process of expansion is that the firms that found it necessary to greatly increase their facilities but a twelvemonth ago are, in very many instances, the same builders who are again reporting the erection of new buildings that mean a tremendous increase in next year's total output of American cars.

It is, moreover, a matter for congratulation that this is the case rather than that new capital seeking wholly unwarranted and totally disproportionate returns for the outlay, should be attracted to this field, thus giving it an artificial as well as dangerous air of prosperity. In short, there is not the faintest suspicion of boom conditions in the American industry to-day despite the fact that it has more than doubled in the past two years. Practically 90 per cent. of this phenomenal growth does not represent an influx of small capitalists into a promised El Dorado such as that which threatened to retard the prospects of the industry in 1903, but consists of the addition of new facilities to plants already the largest of their kind, and the names of whose sponsors are associated with cars that form the backbone of American automobile production.

Considered statistically, the increase in the capital invested—that is, money actually spent for the erection of buildings and the purchase of machinery, will doubtless run up into many millions, while the greater facilities at hand mean an increase in the annual production—already the greatest of the world's automobile producing countries—of many thousands of cars.

Is there an outlet for such a huge number? And can they be produced and placed on the market without precipitating the very condition of affairs that every conservative maker is most anxious to avoid. Trade conditions in the past two seasons supply an answer that could hardly be more satisfactory to all concerned; though it is the lustiest infant that the world has ever seen, the automobile industry is yet in its infancy, and it would be idle to attempt to prophesy its future. Its growth has been characterized by legitimate expansion in accordance with the demand for its products in a manner that has seldom, if ever, been witnessed before, and a continuance of the same policy means long-continued prosperity.

**Vogue of the Twenty-four Hour Automobile Race.**

In the present great popularity of what has come to be familiarly known as "chasing round the clock" is to be seen but one manifestation of the demand for a more strenuous form of contest than has hitherto been commonly looked upon as sufficient to try the merits of the up-to-date automobile. Record after record has gone down—literally annihilated, so great has the margin been by which it has been beaten, finally culminating in the truly phenomenal performance of S. F. Edge on the new Brooklands autodrome in England, whose feat of having averaged considerably better than a mile a minute for twenty-four hours, including all stops for refreshment, tires, fuel, and the like, must go down into history as the first of a line of startling feats of the same character that will doubtless follow, now that their achievement has been made possible by the provision of a proper course upon which to attempt them.

Henceforward long distance races of this character cannot possibly be other than a question of human endurance. It has been amply demonstrated time and again that the limit of the machine is still far from being a known quantity, while that of the driver is well recognized and must always be taken into consideration. But to revert to that phase of the subject dwelt upon first, it is evident that the form of testing for endurance and other qualities, familiarly known to the vernacular as "joy riding," is no more the measure of a car's capacity in any particular than the same distance covered over well-paved streets would be. There is still a large part of the non-autoing public that is waiting to be shown, and the ease with which the up-to-date car can make clockwork records on most of the tests hitherto in vogue has been responsible for the general demand for something a bit more strenuous. At present the answer to the call appears to have taken the shape of the twenty-four hour race, and, judging from some of the performances, this must soon lose its keen edge of interest, and then there will be a demand for something harder. Following in the footsteps of the bicycle, this would doubtless be the six-day "go-as-you-please."

**Fourth Annual A. A. A. Tour Promises Good Results.**

Of undoubted good to the automobile industry will be the Fourth Annual Tour of the A. A. A., which started from Cleveland yesterday morning and will conclude in New York City on July 24. Nearly a hundred motor-driven vehicles, the greater part of them engaged in competing for the Glidden and Hower trophies, will travel some 1,500 miles, over all kinds of roads, and it is safe to prophesy that there will be few to fall by the wayside, and that the tour as a whole will reflect unmistakably the stanchness and reliability of the American automobile, which is now the equal of any built.

### INDEPENDENTS TO SUPPORT CHICAGO SHOW.

After considerable deliberation on the part of the executive committee of the American Motor Car Manufacturers' Association, the conservative element dominated the situation and the Association as a whole has decided to bow to superior force and support the show of the National Association of Automobile Manufacturers at Chicago this fall. It was realized that the latter is so strongly entrenched where the Chicago show is concerned that it would be useless to attempt to make an independent effort this year. But it is said that there will be a different story to be told in 1908. The following announcement issued by the publicity bureau of the A. M. C. M. A. on Monday last explains the situation fully:

"Although the American Motor Car Manufacturers' Association did not receive the recognition which it considered fair to its members in exhibiting at the Chicago show, the committee having the matter in charge felt that rather than disturb the trade conditions at the present time by making a move which might not be beneficial to the industry the present conditions should be supported. Besides, there was a decided lack of interest on the part of manufacturers in connection with the Chicago show, only twenty-three out of forty-five members of the American Association taking space. Big manufacturers like Ford, Buick, Pennsylvania and American Mors did not apply.

"Moreover, the goddess of chance seemed to favor American Association members in the drawing, for, with few exceptions, they all secured excellent space. This, combined with the feeling that an independent show at Chicago this year might not be best for the automobile trade as a whole, has resulted in the announcement that the A. M. C. M. A. would work in harmony with the N. A. A. M. in the promotion of the affair in Chicago this December.

"Working with the Chicago Automobile Club, arrangements for an independent show in Chicago for 1908 are now under way."

### N. A. A. M. TEST CASE GOES HIGHER UP.

As was anticipated would be the case, the New Jersey Court of Errors and Appeals, which is the court of last resort in that State, has decided adversely to the defendant in the case of the State of New Jersey vs. Harry Unwin, under which title the action brought by the National Association of Automobile Manufacturers to test the validity of State laws has been parading. The opinion is to come later. It will be recalled that the action was begun by the prearranged arrest of Harry Unwin, then of the Harrolds Motor Car Company and since with the White Company in New York, for driving a car in Jersey without a license issued by the authorities of that State. The defendant was taken before Justice Higgins in the First District Criminal Court in Jersey City and sentenced to pay a fine of \$10—all of which had been prearranged by counsel to the Association, Charles T. Terry. An appeal was taken and the action has since been slowly making its way up through the Court of Common Pleas and other steps intervening. This adverse decision means that it will be carried to the United States Supreme Court, in accordance with the intention of the sponsors of the action. The latter was originally brought before the obnoxious Freylinghuyesen law, now in force, came into existence, but this does not alter matters, as the principle remains the same—that of a State compelling residents of another State to pay for the privilege of traveling within her borders, as well as test the constitutionality of State registration laws generally.

### GERMANY REFUSES THE WRIGHTS' INVENTION.

BERLIN, July 1.—It is commonly reported in well-informed circles here that the German Government has refused to buy the Wright brothers' aeroplane, giving as a reason that the machine is not suited for military purposes. It can only carry one man, who would be too occupied with the control of the machine to be able to perform any other duties.

### A. M. C. M. A. ADOPTS STANDARD WARRANTY.

While each member of the American Motor Car Manufacturers' Association, usually known as the independents, has made a practice of guaranteeing his cars, no official action has hitherto been taken on the subject by the Association as a whole. The matter came up for discussion before the committee of management at its last meeting on June 27 and a warranty, to be known as the A. M. C. M. A. guarantee, was formally adopted.

We warrant the motor vehicles manufactured by us for ninety days after the date of shipment, this warranty being limited to the furnishing by our factory of such parts of the motor vehicle as shall, under normal use and service, appear to us to have been defective in material or workmanship.

This warranty is limited to the shipment to the purchaser, without charge, except for transportation, of the part or parts intended to replace the part or parts claimed to have been defective, and which, upon their return to us at our factory for inspection, we shall have determined were defective, and provided the transportation charges for the parts so returned have been prepaid.

We make no warranty whatever in respect of tires, rims, and batteries.

The condition of this warranty is such that if the motor vehicle to which it applies is altered, or repaired, outside of our factory, our liability under this warranty shall cease.

The purchaser understands and agrees that no warranty of the motor vehicle is made, or authorized to be made, by this company, other than that hereinabove set forth.

Dated.....

### W. F. FULLER HEADS CONNECTICUT ASSOCIATION.

HARTFORD, CONN., July 8.—President William F. Fuller, of the Hartford Automobile Club, was recently elected president of the Connecticut State Association of the American Automobile Association. Major George M. Landers, of New Britain, insisted upon the acceptance of his resignation as president of the State body, of which he will still remain a director, stating that his time was too much occupied at present to permit him to give proper attention to the office. Frank T. Staples, of the Automobile Club of Bridgeport, is vice-president of the Connecticut Association; Guy K. Dustin, of the Hartford Club, secretary, and B. R. Hertzberg, of the Stamford Club, treasurer. The State Association is now composed of clubs in Hartford, New Britain, Bridgeport, Stamford and Yale. The Automobile Club of Stamford and the Yale Automobile Club were admitted at the last meeting.

### CHANGED DATE FOR ST. LOUIS BALLOON RACE.

A cable from Courtlandt Field Bishop, now in Paris, announces that the Gordon Bennett international balloon race will be held on Monday, October 21, and not on Saturday, October 19, as at first intended. To comply with the rules requiring competitors' names to be made known sixty days before the event, they should be sent in by August 21. As is well known, Italy will not be a contestant in the race, owing to entries not having been sent in at the proper time. The Spanish club having failed to forward its entrance fee for three balloons entered, negotiations will have to be begun in order to regularize their participation.

Secretary A. B. Lambert of the St. Louis Aero Club, who is visiting Paris for the second time this year, says that the citizens of St. Louis are subscribing money for prizes of \$5,000 and \$3,000 for an aeroplane and steerable balloon demonstration to take place after the Gordon Bennett contest.

### DATES SET FOR A. C. A. PALACE SHOW.

Speculation as to the date of the combined eighth annual show of the Automobile Club of America and the American Motor Car Manufacturers' Association has been set at rest by the announcement that it will be held in the Grand Central Palace from October 24 to 31, ending just two days before the opening of the Garden show. Arrangements have been made for an increased amount of space and a new scheme of decoration is being prepared. The club will probably hold its annual banquet on the closing day of the show.

### HEINZE FURNISHES LOWELL EXCITING SPORT.

LOWELL, MASS., July 8.—Exceedingly fast times and an accident that came near proving fatal to A. E. Morrison, of Boston, marked the race meet promoted by J. O. Heinze, of the Heinze Electric Company of this city, and held here on the Fourth before a crowd of more than 20,000 people. The races were held on the Boulevard and the course for miles was lined with people many deep. It was impossible to properly police the long stretch and the spectators interfered more or less with the competitors, otherwise faster times might have been made. In other respects the program furnished excellent sport and the arrangement was carried out without a hitch other than a slight delay due to the accident to Morrison, who lost control of his Stearns near the upper end of Tyng's Island. It is thought he attempted to turn at too high a speed and the car turned turtle, breaking his left leg. It was at first reported that Morrison had been killed and the races were ordered stopped. George M. Brown, who brought the injured man back to the line in his Apperson car soon proved the report to be false and the program was resumed.

In the races that followed some excellent times were made, particularly in the five-mile event for high-speed runabouts, which was won by the American, driven by W. A. Frederick, in 5:10. Other events that brought forth considerable applause were the exhibition spurts against time in which Robinson in a Stevens-Duryea covered the course in 46 1-2 seconds, this again being lowered by Fred Marriott in the Stanley steamer, who did the distance in :45 1-4. The final was a free-for-all and was won by the American, W. Frederick up, who did the mile in 45 seconds, making the best time of the day, the Corbin, driven by Wilson, being second in 1:03 1-2. J. O. Heinze had general charge of the arrangements, being assisted by Harry J. Noyes and J. Fred Walsh. The summaries of the event follow:

#### FIVE MILES, FOR GASOLINE TOURING CARS, 24-H.P. OR LESS.

1. Corbin, 24-horsepower; driver, Wilson..... 6:28

#### FIVE MILES, FOR GASOLINE TOURING CARS, 24-H.P. OR OVER.

1. Stevens-Duryea, 50-horsepower; driver, Hancock..... 5:00

#### FIVE MILES, FOR HIGH-POWERED GASOLINE RUNABOUTS.

1. American, 45-horsepower; driver, W. A. Frederick..... 5:10

#### ONE-MILE STRAIGHTAWAY, FREE-FOR-ALL; FLYING START.

1. Stanley steamer; driver, Fred Marriott..... 0:45 1-4

#### ONE-MILE EXHIBITION RACE.

- Stevens-Duryea, 50-horsepower; driver, Hancock..... 0:46 1-2

### READING MEET BRIMFUL OF EXCITEMENT.

READING, PA., July 8.—Events not on the program afforded considerable added interest to the meet of the Berkshire Association here last Thursday. To lead off with, Robert Morton, driving a 30-horsepower Pullman in the first automobile event on the program, left the track on a curve at full speed and crashed through the fence. Morton saw what was coming, however, and jumped in the nick of time, so that he drove in the following events. He could not explain the cause of the accident and it was thought to be due to an excess of patriotism on the part of a small boy in throwing firecrackers. The latter also contributed more excitement later in the day, when someone threw firecrackers under George McFarland's Stanley steamer, setting both the car and his clothing ablaze. He was painfully but not seriously hurt.

In the races the showing of the York Motor Car Company's Pullman cars and the Jackson from the garage of the Motor Vehicle Company was the feature of the day. The first event on the program was a motorcycle race, which was followed by a two-mile race for the Rambler Cup, open to stock gasoline runabouts costing \$3,000 and under. The first heat was between a 30-horsepower Oldsmobile and a 30-horsepower Pullman, the latter winning in 2:41 2-5, while the second heat was between a 30-horsepower Haynes and a 40-horsepower Pullman, the latter win-

ning in 3:09 and also taking the final. The winning car was protested by the Haynes as not being a stock car, but the protest was overruled. The star feature of the meet was the two-mile race from a flying start, open to stock cars costing \$1,200 to \$2,500 for the E. S. Youse Cup. It was competed for by the 30-horsepower Jackson and the 35-horsepower Rambler, driven by Zimmerman and Herbert Bitner respectively. The race was nip and tuck for every foot of the eight laps of the half-mile track, both drivers showing considerable skill in taking the pole away from one another at the turns, the Jackson winning by a final spurt in 3:05 1-5.

The success of the meet was largely contributed to by the attendance of the members of the Motor Club of Harrisburg, which held a run to this city for the occasion and were hospitably entertained by the Berkshire Association.

### ST. LOUIS HAS A TWENTY-FOUR HOUR RACE.

ST. LOUIS, Mo., July 8.—Out of a field composed of a 50-horsepower Haynes driven by Wagner and Willard, a 60-horsepower Stearns driven by Alvin and Gorham, a 35-horsepower Matheson driven by Smith and Bane, a 35-horsepower Oldsmobile driven by Corkhill and Bagnell, a 30-horsepower Cadillac driven by Suttkers, and a 15-horsepower Elmore alternately piloted by Richter and O'Neill, a 35-horsepower Jackson with Burman at the wheel took the honors in the twenty-four-hour chase round the clock, which was started at the old Fair Ground race track here at 10 P.M. on July 3, by reeling off 833 miles, the Matheson finishing second with 752 miles to its credit. A Pope-Toledo, a Maxwell and a single-cylinder Cadillac were to have started, but were withdrawn. About 5,000 people were in the grand stand at the start and when the flag dropped the Haynes and Cadillac jumped into the lead and stayed neck and neck for the first thirty miles. At the end of the first hour the Cadillac was four miles ahead, the score standing: Cadillac, 43 miles; Haynes, 39 1-2 miles; Jackson, 39 1-4 miles; Stearns, 37 1-2 miles; Elmore, 36 miles; Matheson, 35 miles, and Oldsmobile 32 1-2 miles. The Haynes had trouble during the early morning and finally dropped out at the twenty-second hour, with 642 miles to its credit; the Elmore quit four hours earlier, or at the eighteenth hour, after having covered 502 miles. The Matheson maintained a comparatively slow but consistent pace and lost little time in adjustments. The summaries of the races which preceded the twenty-four-hour event, on the first day, are as follows:

#### FIVE MILES, STOCK TOURING CARS, \$2,000 OR UNDER.

1. Cadillac, 20-horsepower; driver, W. Bagnall..... 7:34 1-5

#### FIVE MILES, STOCK TOURING CARS, \$3,000 AND UNDER.

1. Jackson, 40-horsepower; driver, R. Burman..... 7:01
2. Corbin, 24-horsepower; driver, A. B. Cull.
3. Wayne, 35-horsepower; driver, Will Smythe.

#### TEN MILES FOR RUNABOUTS, \$3,000 OR UNDER.

1. Thomas, 40-horsepower; driver, Robbins..... 13:28
2. Wayne, 30-horsepower; driver, Will Smythe.

#### TWENTY MILES FOR HIGH-POWERED RUNABOUTS.

1. Packard, 30-horsepower; driver, Fred Grinham..... 23:32 1-2
2. American, 45-horsepower; driver, Tone.

#### TEN MILES FOR MOTORCYCLES.

1. Thoroughbred; rider, F. N. Maynard..... 7:25
2. Indian.

#### SPECIAL TEN-MILE EVENT.

1. Packard, 30-horsepower; driver, Fred Grinham.

### BARNEY OLDFIELD ATTEMPTS SUICIDE.

PORTLAND, ORE., July 6.—As the result of his arrest on the technical charge of having obtained money under false pretenses, by using the name of the local automobile club in order to obtain prestige for the race meet held here a few days ago, without the sanction of the club, Barney Oldfield to-day attempted to jump from the window of his room in the hotel. He smashed the glass with his bare hands, which were badly cut, but he was restrained from jumping by his wife and a hotel detective, who responded to her calls for help.

21 CLEAN SCORES IN BAY STATE RUN.

BOSTON, July 8.—The touring committee of the Bay State Automobile Association, under whose auspices the endurance run from this city to Keene, N. H., and return, a distance of 207 miles, was held on Saturday, held a meeting to-day and announced that twenty-one cars had made perfect scores, while twelve were penalized. Of the cars with perfect scores, four are runabouts and the remainder touring cars. The perfect-score cars will be given handsomely engraved certificates. The results are as follows:

Car	Driver	Penalties
*Oldsmobile	A. A. Knights	0
*Peerless	H. H. Brown	0
Pope-Hartford	E. E. Dodge	0
Columbla	H. Woodaver	0
Rambler	V. A. Charles	0
Peerless	R. R. Ross	0
Marmon	F. F. Wing	0
Berliet	H. Grant	0
*Shawmut	H. Church	0
Cadillac	H. Kroh	0
Grout	L. W. Grout	0
Winton	L. B. Harris	0
Stoddard-Dayton	G. Todd	0
*Craig-Toledo	W. H. Latham	0
Studebaker	W. G. Jones	0
Corbin	J. Corbett	0
Knox	F. S. Crockett	0
Knox	W. E. Wright	0
Lozier	R. Mulford	0
Elmore	G. W. Turner	0
American Mors	F. L. Townsend	0
Dragon	C. J. Lewis	1
Aerocar	F. Page	2
*Jackson	E. P. Blake	3
Maxwell	R. Coburn	3
Rambler	J. E. Brennan	4
*Corbin	J. Matson	6
American	W. R. Kelley	32
*Cadillac	H. Murch	33
*Ford	Partridge	43
Grout	H. H. Hawkins	50
Rainier	C. D. Price	174
Bay State Forty	R. Drisko	Dropped out
Ross	A. H. Waltt	Did not start

\*Runabouts.

A. C. OF ST. PAUL MAKES A STATEMENT.

Editor THE AUTOMOBILE:

Inasmuch as mention has been made in your paper of the race meet scheduled for June 28 and 29 at our State Fair Grounds, by the United States Racing Association, under the auspices of the St. Paul Automobile Club, I desire to inform you of some of the facts in respect to said meet, in order that the same may be properly written up in your magazine. The United States Racing Association, under the management of H. W. Pickens, agreed to run the meet, furnish its cars and drivers, and advertise the same. Among the drivers it agreed to furnish and which through its advertisements it promised the public would take part in the meet, were Eddle Bald, with his American car; Mongini, with his Matheson; Coey, with his Thomas; Herbert Lytle, Kullick, and Kid McCoy. The meet was to consist of a \$3,000 sweepstakes race in which the professional drivers were to take part Friday afternoon, a 24-hour endurance race in which they were to take part, and a preliminary program of local events.

Upon arriving in St. Paul a few days before the meet Mr. Pickens informed us that the racing cars had been shipped and the drivers would be here. When they actually pulled off the meet it developed that the only drivers brought were Bald and Mongini; that they had not brought a single car, and we had to secure from our club members the loan of cars for Bald and Mongini to drive. The \$3,000 sweepstakes race scheduled to be the event for Friday afternoon and to be participated in by the professional drivers with their own cars was not run, but was postponed until Saturday, at the end of the meet, and then run by Bald and Mongini with two local cars. The result was that the public on Friday afternoon considered itself the victims of a bunco game on the part of the United States Racing Association, and the attendance on Saturday afternoon was naturally extremely small.

As secretary of the Automobile Club I have been deluged since the meet with complaints on the part of the spectators on account of the misrepresentation made by the United States Racing Association. Mr. Pickens has presented to us no reasonable excuse for not having furnished drivers and their cars outside of Coey, and the matter would seem to be clearly one for a protest to the A. A. A. Racing Board. What action the club will take I cannot say, as the matter has not been formally acted upon, but I write this information to you in order that the meet may be written up as it should be in your magazine.

H. S. JOHNSON,  
St. Paul, Minn. Secretary, Automobile Club of St. Paul.

GROWTH OF AUTO ROUTE INFORMATION.

Probably there are a few copies yet in existence of the Official Automobile Blue Books for 1901 and 1903, the result of the first attempts to map out routes especially for automobile touring in this country. If those who still have the 1901 edition will place it alongside the set of three volumes comprising "The Automobile Official A. A. A. Blue Book," No. 3 of which has recently been issued, the growth of six years will be shown in a very striking manner.

The outside cover of the original volume reached exactly to the top of the gold-leaf imprint on the latest volume. A still greater contrast is shown by the inside pages on which the routes are listed, the dimensions being 5¾ inches by 3¾ inches in the 1901 edition, as against 8½ by 4½ inches in the 1907 edition. Expressed in type area, there are only 21.56 square inches on the smaller page to 38.25 square inches on the larger page.

There are exactly 68 net pages of route matter in the original Blue Book, with more than half of these pages partly blank. Nearly twice as much type is used for the New York City section alone of the New York State volume as the aggregate of route matter in the initial volume. In 1901 there were no maps; in the present editions there are about 700 route maps and city and town diagrams. As a piece of publishing the 1907 Blue Books are equal to about 40 of the first edition bulked together.

VERMONT ADOPTS RECIPROCAL POLICY.

In perusing the "Official Automobile Blue Book" many autoists have been struck by the fact that in the chart of automobile laws printed therein no reference was made to the Vermont law. Good and sufficient reason is to be found for this apparent omission in the fact that there is no Vermont law, for up to the present the legislature of that State has not seen fit to pass any specific legislation on this subject. The Vermont Secretary of State has, however, informed the editor of the Blue Book that "non-residents who are duly licensed in the State of their residence and whose cars are registered therein need not take out another license.

CHICAGO DRIVERS TAKE HONORS AT PEORIA.

PEORIA, ILL., July 6.—There was a race meet held here on the fourth, but one might have thought himself in Chicago, for drivers from the latter city took firsts in all the events except the initial one on the program in which Price, driving a 16-horsepower Maxwell, was pitted against Bald in a 40-horsepower Glide, who naturally had an easy time of it, making the ten miles in 14:56. The event of the day was termed a six-hour Endurance Derby, in which C. A. Coey, in a 60-horsepower Thomas, carried everything before him, making 269 miles, thus beating the former record of 238 miles made by Charles Soules in a Pope-Toledo at Columbus in 1905 by a comfortable margin. Following is the summary of events:

TEN MILES FOR TOURING CARS UNDER \$2,500.

1. Glide, 40 horsepower; driver, Eddle Bald.....14:56
2. Maxwell, 16 horsepower; driver, C. W. Price.

FIVE-MILE MATCH RACE, STANDING START.

1. Thomas, 60 horsepower (four cylinder); driver, C. A. Coey...7:38
2. Glide, 60 horsepower (six cylinder); driver, R. Mongini.

SIX-HOUR ENDURANCE RACE.

1. Thomas, 60 horsepower; driver, C. A. Coey.....269 miles.
2. Glide, 60 horsepower; driver, A. Mongini.....231 miles.
3. Glide, 40 horsepower; driver, Eddle Bald.....216 miles.
4. Maxwell, 16 horsepower; driver, C. W. Price.....186 miles.

INCREASED TAXATION FOR NEW JERSEYITES.

TRENTON, N. J., July 9.—Additional taxation for New Jersey automobilists is proposed in a bill to be presented at the present session of the State Legislature by Assemblyman Simon Hahn, of Essex County. The measure, which is in the nature of an amendment to the Frelinghuysen automobile law, proposes that the fee of \$3 for vehicles under 30-horsepower should be increased to \$10, and that cars over 30 horsepower should pay \$15. The proceeds of this increased taxation are to go toward the abolition of the dust nuisance.

ENGLAND'S SEA-WASHED COAST AT SALTBURN, WHERE THE YORKSHIRE AUTOMOBILE CLUB HOLDS ITS ANNUAL MEET.

### RACING ON SALTBURN SANDS IN YORKSHIRE.

SALTBURN-BY-THE-SEA, ENGLAND, June 30.—A. Lee Guinness' flight of 1,100 yards across Yorkshire's rain and sea-sodden sands at the terrific rate of 111.84 miles an hour was the outstanding feature of the third annual Yorkshire Automobile Club meet in this usually quiet Northern seaside resort. Guinness drove the eight-cylinder 200-horsepower Darracq with which Hemery first broke records in the south of France and on Florida beach and had the glory of beating hollow last year's figures of 96.5 miles an hour established by Warwick Wright, also on a Darracq. The performance is not a world's record, for last July at Ostend, with the same machine, the young Englishman covered the kilometer in 19 seconds, equal to 117.5 miles an hour. Very heavy showers fell throughout the day and the sea invaded the track, making what would have been an excellent course into a moderate one. The Darracq's only competitor was a Dietrich driven by Suison, who failed to make a good showing.

Owing to the wet condition of the starting boards considerable difficulty was experienced by many competitors in making a start. When dry sand had not been put under the wheels they frequently revolved two or three seconds without the machine advancing an inch. In Event G, for touring cars costing not more than \$2,000 and carrying the full load of four passengers, two 15-horsepower Fords competed together, the victor covering the course at the rate of 30.98 miles an hour. Another good race was witnessed between J. E. Hutton's Berliet and F. A. Bolton's Daimler, won by the French machine at the rate of 48.63 miles an hour. A strong force of police kept the crowd of spectators on the grassy cliffs, which formed a natural grand stand, and signalers from the royal navy rendered valuable service in transmitting messages from one end of the course to the other. As an indication of the thoroughness of the organization, it is interesting to note that the managing committee insured the whole of the crowd of spectators with Lloyd's against all risks.

### 50-MILE AUTO RACE TRACK FOR GERMANY.

BERLIN, July 6.—After England and America, Germany is to have a special race track for automobiles, provisional approval for which has just been granted by Emperor William. The course proposed by the Imperial Automobile Club will be fifty miles long and thirty feet in width, laid out through valleys, over hills and bridges and around sharp curves. Its location is near Eilfel, in Rhenish Prussia. The capital required for the construction of the track is estimated at several million of dollars, which will be sought from leading automobilists and automobile manufacturers. As the matter has the royal approval, it is thought that the plans for its completion will be rushed through without any delay.

### LONDONERS SEE FAST RACING AT BROOKLANDS

LONDON, July 6.—Huge crowds gathered at the Brooklands track to-day on the occasion of the first public races and waxed enthusiastic over a mediocre performance. The meeting, however, had the advantage of novelty and gave Londoners an exhibition of automobile speed to which they have previously been entire strangers. A number of Continental drivers came over to compete in the races, which were planned on the same lines as horse races, the vehicles starting simultaneously and the only criterion of success being priority in passing the winning post. Each driver wore a colored jacket, as is done by jockeys in horse races. J. E. Hutton, driving a French Berliet, won the Montagu cup, valued at \$9,500, besides a trophy worth \$1,000, in a keen competition uniting eleven starters. The stakes in the half dozen races aggregated \$22,500. No official times were taken, but in several cases a speed of ninety miles an hour was attained and the excitement ran high.

In his recent twenty-four-hour track performance, when, on a six-cylinder Napier he covered 1,581 3-4 miles, S. F. Edge had his machine fitted with a special seat and was protected by a glass wind shield of the smallest possible dimensions to reduce resistance. The machine was a standard model stripped for the occasion and fitted with wire wheels. Instead of changing tires, the wheels were taken off and replaced by others with the inflated tires in position. For several weeks before the event Edge had undergone a rigorous training in swimming, cycling, walking, Sandow exercises, and long rides on the car he was to drive in the race. He declares that the physical feature of the race was more important than the mechanical one, as the question was entirely one of human endurance in which the machine played no part.

EDGE'S RECORD BREAKING NAPIER ON BROOKLANDS TRACK.

## CLUB DOINGS IN THE MIDSUMMER SEASON

### Grand Rapids Club Agrees with Park Commissioners.

GRAND RAPIDS, MICH., July 8.—The question of excluding automobiles from the parks has been settled by a compromise, to which the Automobile Club of Grand Rapids agreed. At the last meeting of the Park Commissioners it was decided that it would be unnecessary to exclude automobiles from all parks, but owing to the danger on the principal street in John Ball Park, called Glenwood road, which is very narrow and crowded in the afternoons, automobiles will not be allowed the use of this road after 2 P.M. each day. With this exception automobiles will be allowed anywhere in the parks.

The automobile club has called the attention of one of the aldermen to the State law requiring drivers to keep to the right in passing another rig, with the result that the aldermen will introduce a resolution into the council the purpose of which will be the enforcement of the State law in this regard. It is the desire that vehicles shall not only keep to the right, but if they desire to stop on the opposite side of the street that they shall turn completely around before stopping to avoid the confusion that would otherwise result.

Many complaints have come to the Sheriff's office lately from farmers whose rigs have been capsized or other damage done by their horses being frightened at speeding autos. The complaints were so frequent that he caused an investigation to be made. The limit of twenty-five miles is set by the State law, which also requires that drivers of autos shall not go faster than ten miles an hour when passing other conveyances.

The club at its last meeting resolved to support the sheriff in this action, the same as it has always done in cases of a similar nature. The club has taken a stand especially against the driving of autos by irresponsible youngsters, as it has been found that practically all of the accidents that have occurred have been due to the fact that young people were running the machines.

Members of the club are taking full advantage of their new country clubhouse. Every afternoon the Cascade Springs road is alive with autoists, who are going and coming from dinner parties held at the clubhouse. The city is full of visitors at the furniture exposition, and parties of these are being entertained every evening at the clubhouse.

### Seattle's New Club Purchases a Country House.

SEATTLE, WASH., July 3.—Appropriate quarters for the recently organized Auto and Driving Club of this city have been secured by the purchase of the W. J. Bernard residence at Alki Point. The latter is a typical log house on the exterior and has long been a point of interest for visitors; its interior is finished in modern fashion, however, and it is, moreover, elaborately furnished. The house is being remodeled inside for club purposes, while the club stables are also being done over to accommodate a number of automobiles, and the whole has been placed in charge of Charles Borngesser as manager, who has been long and favorably known here for his ability in this line. The acquisition of such attractive quarters and all the advantages they afford will doubtless do a great deal to rapidly swell the club's membership.

### Philadelphia Club Nearing the 500 Membership Mark.

PHILADELPHIA, July 8.—Judging from the present rate at which its membership list is growing, the Automobile Club of Philadelphia is in a fair way to accomplish the object outlined at its last annual meeting, the increase of its roster to the half-thousand mark. At the last monthly meeting held a few days ago, 31 new names were added, bringing the total to 436, prominent among the additions being President McCrea, of the Pennsylvania Railroad; James Elverson, owner of the Philadelphia *Inquirer*; Bert Lippincott, William H. Wanamaker, Jr., Dr. John Denver and others. Chairman Powell Evans, of the routes and signpost committee, announces that the work of posting the Trenton and Harrisburg routes will be immediately undertaken, and the board of directors in recognition of the good work being done by this committee has agreed to double its appropriation, so that all roads leading into the city may eventually be marked for the benefit of tourists.

S. Boyer Davis, secretary and counsel for the club, reports that the State ruling in reference to "tooting" the horn at all cross-roads is again being very strictly enforced, and, in order to avoid arrest and the subsequent fine, it is suggested that every automobilist blow his horn at every cross-road throughout the eastern section of the State.

NEW CLUB HOUSE OF "LA MOVEGANZA KLUBO."

The home of the society women's new automobile club of Philadelphia. The mansion antedates the Revolution, and was at one time the residence of Benedict Arnold. It is located in Fairmount Park, one of the Quaker City's beauty spots.

### Minnesota Club to Work for Improved Roads.

WADENA, MINN., July 6.—There are twelve autoists in this town, and they have decided to get together to form an automobile club. While the principal objects of the organi-

zation will not differ from those of other clubs, the chief motive of automobilists in this part of the country in getting together is to see what can be done by concerted effort to improve the local highways. It is thought that autoists from the surrounding territory will be induced to join in the movement, so that the club will be able to boast of a membership of at least fifty before long, when a fund for the improvement of the main highways will be raised.

### Chicago Autoists' Race Meet for Glidden Tourists.

CHICAGO, ILL., July 8.—The Chicago Automobile Club has prepared most elaborate plans for the entertainment of the Gliddenites during their two-day stay here, probably the greatest feature of interest being the auto race meet to be held at the Harlem track on July 12 and 13. In the way of novelties the star performance in this will probably consist of what has been dubbed the Cupid race, three miles, open to stock touring cars carrying four women passengers, one of which is to be dropped at each quarter of the first mile, and who will again be picked up in the same order on the second mile, the finish being with all on board. No provision has been made for mistakes in picking up the passengers, and it is thought that the attempt of two or three cars to pick up its passengers at once will result in considerable amusement and excitement. A twenty-four hour chase round the clock, to be known as the International Endurance Derby, is also a feature of the program. The tourists are also to be entertained in other ways, special attention being paid to the fair members.

#### CHINESE MINISTER'S CHILDREN IN A WINTON TYPE X-I-V.

The minister's daughter and little son are in the rear seat with the wife of the first secretary of the legation, Mr. Chow, who is at the wheel, and alongside is his baby, who was born in Washington, at the Chinese legation.

#### TO DRIVE POPE-TOLEDO IN ALASKA.

"Make-a-dam, but the roads in Norway are great," says Carl Lilliesterna, the Swedish auto globe trotter, who has just arrived on this side, making his fourth trip here in six years. In addition to being the only automobile hobo, Carl is an accomplished linguist, though his pronunciation is not always of the best, and it is never possible to guess what language he is thinking in at the moment. For instance, he did not intend to be profane regarding Norway's highways—it is only his way of saying macadam. Carl has driven an automobile all over the world, with the exception of Africa and Alaska, and it is the latter part of the terrestrial crust that he is now bound for, where he will take charge of the wheel of the Pope-Toledo which is to form the rolling stock of the most northerly stage line in the world.

Captain J. B. Hubrick, who made a reputation by successfully installing and operating a cable ferry across the Yukon at Dawson where so many others failed, is again going to attempt something that many others have been unable to accomplish—the running of a stage between Dawson and Granville. To do it with he has ordered a regular 40-horsepower Pope-Toledo touring car with accommodation for seven passengers and it is interesting to note the extended trip the car must take before it reaches

CARL LILLIESTERNA IN FAR NORTH POPE-TOLEDO.

the scene of its duties. From Toledo it will go to Seattle by fast freight to the coast, from there to Skagway by boat, then to the White Pass by rail, from which it will be carried on a flat-boat to Dawson. The car is painted a bright red in order to contrast with the snow, and its only special equipment consists of five-inch tires, extra tanks for gasoline, oil, water and anti-freezing liquids, as well as additional carrying cases for tires, batteries and spare coils, and it is equipped with enough accessories for a year's tour, though the route from Dawson to Granville can be covered in half a day. The success of the Pope-Toledo on the Tonopah, Goldfield and Death Valley stage lines suggested the idea and negotiations were immediately undertaken by wire. The fares have not been announced as yet, but there is not much chance of their being in accordance with the provisions of any two-cent-a-mile legislation.

#### GEORGIA LEGISLATOR LEARNS TO SELL AUTOS.

ATLANTA, GA., July 8.—After an absence of two years from the State, the Hon. John A. Sibley, a former member of the House of Representatives from Cobb county, has returned to Atlanta as representative of the Cadillac Motor Car Co. of Detroit. Mr. Sibley will have one of the largest territories in the United States, extending from the Potomac and Ohio rivers on the north to the Rio Grande on the southwest.

Mr. Sibley was only recently married to Miss Susie Cunningham, of Detroit, and he and his bride will be at the Majestic Hotel. In speaking of the future of automobiles and the agency at Atlanta, Mr. Sibley says: "The automobile has come to stay. I thought a business of that kind was the very thing for a hustler and I determined to learn it from the bottom. I went to Detroit, applied for a position and started as a machinist at 20 cents an hour. I worked in the Cadillac plant for nearly a year, engaging in every detail of construction. After some months of service I was transferred from construction work to the sales department of the Chicago dealers and the next step was my appointment as Southern representative."

#### ACME TO JOIN SIX-CYLINDER CONTINGENT.

While it will still continue to manufacture the four-cylinder cars that have long been known under this name, the Acme Motor Company, of Reading, Pa., announces that it will bring out a six-cylinder car for the season of 1908. The new car will be largely patterned along the same lines as its smaller predecessors, except that it will be equipped with drop axles and will have both the motor and transmission placed slightly lower. It will have a wheelbase of 122 inches and will embody numerous detailed refinements. The designer of the company, R. E. Graham, has made an exhaustive investigation into the matter of the popularity of the six-cylinder car with the result that he has come to the conclusion that it is here to stay and is not merely a fad. A six-cylinder high-powered runabout will also be placed on the market, using the same chassis as a foundation.

#### BARTHOLOMEW COMPANY PLANS ADDITION.

PEORIA, ILL., July 8.—Unless present plans miscarry, by the end of the year the Bartholomew Company of this city, builders of the Glide cars, will have one of the largest and most complete automobile factories in the country. Plans for an addition to cost \$150,000 have been completed and it is expected that construction will begin this fall, the new buildings to be erected on the company's property at West Bluff. Sometime ago plans were drawn for a large addition to the company's facilities, but before carrying them out it was decided to expand on a much more comprehensive scale. The new building will be about the same size as the present erecting shop on Fredonia avenue and will greatly increase the plant's capacity for turning out both four and six-cylinder cars during the season of 1906.

### A SUCCESSFUL POPULAR-PRICED CAR.

"Power carriage" is the latest title for the variously styled "buggyabout," "buggymobile" and other similar designations of the real horseless carriage which is destined to form a most potent factor of the American automobile industry in the near future. Minus the power plant, the scale on which this truly American type of vehicle—the top buggy—is turned out by the large factories of the West is something almost inconceivable. Automobile plants usually rate their output as "so many a week," but many large buggy factories say "so many an hour," and the annual total is something stupendous, for every country dweller owns a buggy, even if he can boast of no other means of transport. It is a firm that has long catered to the wants of the rural resident in this field—the Columbus Buggy Company, Columbus, O.—that has now undertaken the task of building popular-priced automobiles on a similar scale. And that it can "deliver the goods" with its buggymobile, to make use of a bit of vernacular, was amply demonstrated by the test run of one of these cars, as here illustrated, from Independence to Columbus, a distance of 200 miles, which was made at a total cost of slightly less than \$1.60 for two passengers, or way below railway rates.

Simplicity is naturally the keynote of any such vehicle, but economy in operation is nevertheless paramount. In fact, it is

ADAMS FARWELL CARS TAKE GRADUATING CLASS RIDING.

At the close of the college commencement season, the Adams Company of Dubuque, Ia., placed at the disposal of the graduating class of Mount St Joseph's Academy, a number of Adams-Farwell cars for an outing. The picture was taken on leaving the academy grounds.

### ON TIRE BLOWOUTS AND THEIR CAUSES.

Generally, when an automobile tire bursts on the road, the driver searches round for the sharp stone or other cutting object and fails to find it. As a matter of fact, says Michelin, the tire expert, a tire rarely bursts immediately after coming in contact with a sharp stone and the victim of a blow-out should not search around him on the road, but go back twenty or thirty miles if he wishes to make acquaintance with the cause of his disaster. After some heavy strain on its fabric, a tire may noisily depart this present life on the lonely highway. The decrease may be legitimate, arriving after long loyal service. Or it may be that a strong constitution is undermined, after a short life, through excesses of the lord and master. It should never be forgotten that weight is a deadly enemy.

Insufficient pressure causes rapid deterioration of an automobile tire. If an accident happens when the car is loaded and the pressure in the tires is lower than it ought to be, the driver frankly takes the blame on himself. Sometimes the blowout will occur when the driver is alone in the car and when his tires have been inflated to the exact degree. Or it may be, though the case is rare, that the disquieting report is heard when the machine is in the garage. In such a case the manufacturer is blamed for supplying an inferior article, blamed vigorously and with apparent justice. The automobilist should consider, however, that he may, after all, be responsible. His tires are properly inflated to-day, but in what condition were they used yesterday and the day before is another question.

COLUMBUS BUGGY COMPANY'S LATEST PRODUCTION.

the matter of economy of maintenance that counts highest in the estimation of the average user of this class of vehicle, but that both these highly important essentials have been achieved by Designer C. C. Bramwell in a manner hitherto unapproached is the opinion of President C. D. Firestone of the company, as well as of all who watched the car's record-breaking performance under most adverse weather and road conditions. With a rather important exception, that of the power plant, the details of the entire vehicle can be taken in at a glance. The motor, located under the body, but readily accessible by lifting the footboards, is of the two-cylinder horizontal type, air-cooled, and is rated at 10 horsepower. High tension ignition using dry batteries is fitted, the twin-coil being placed on the dash, this and other accessories such as the carbureter being of a high grade. The motor drives to a countershaft by single chain and the latter in turn is connected to the driving wheels by ropes. Both axles are single pieces of solid steel of square section, full elliptic springs constituting the suspension, the rear springs being of the scroll type. Steering is by tiller mounted on a vertical standard at the left-hand side, while the gasoline tank is located under a short bonnet forward of the dash and holds a liberal supply.

Lake Geneva, Wis.—Work has been commenced on a new building to be occupied by Samuel T. Hutchinson, on the north end of Lake House, facing Broad street. The building is to be used as a garage and repair shop.

WHERE THE BIG AND LITTLE FORDS ARE TRIED OUT.

That Ford Sixes are subjected to severe high-speed tests is shown by the above picture taken on the Highland race course, Detroit, the one-mile track which the Ford Motor Company recently purchased with 60 acres of ground, on which the new Ford plant is to be erected.

A CHANCE MEETING NEAR AGUAS CALIENTES, MEXICO.

Reo touring car and an Orient Buckboard exchanging greetings many miles from home in the interior of Mexico. The cones in the background are corn storehouses built of adobe—sun-baked brick—familiar Mexican landmarks.

### PREMIER CAR ROLLS UP PHENOMENAL MILEAGE.

With the accidental breaking of a wire while changing batteries there was brought to an end, through a mere technicality, one of the longest non-stop motor runs ever made. At 10 o'clock on the night of June 3 a regular stock Premier 24-horsepower car was cranked by Frank P. Miller, president of the Bridgeport Automobile Club, in a drenching rain, which continued for the greater part of the first week, keeping the roads in a heavy and continually slippery state. The run was conducted by the Fairfield Automobile Company, of Bridgeport, Conn., under the auspices of the Bridgeport club, the official record of the mileage of the car being 4,906, though the motor evidently traveled the equivalent of several hundred miles more owing to the number of stops required for replenishing the gasoline supply, changing crews and passengers and the like. No particular route was followed, the car being taken all over the State of Connecticut wherever the driver wished to go, no less than twenty round trips having been completed between Bridgeport and New York. During all this time at least two passengers were carried, and on one occasion no less than ten were taken along. Unlike the usual affair of the kind little or no attempt was made to make capital out of it, the makers of the car not being apprised of the test nor of the number of the car. The best previous non-stop record falls short of this performance by some 1,300 miles, and it seems unfortunate that the motor should have been stopped by such a trivial accident, though it must be added that the previous record of 3,600 miles was made under exceedingly strenuous weather conditions in midwinter, which is in its favor.

### MORA FINISHES 3,000 MILE SEALED BONNET. ]

With its return to New York late last Thursday night, the Mora Racytype car completed one of the longest runs that has ever been made under sealed bonnet conditions. It will be recalled that this was one of the cars that competed successfully in the recent contest of the Automobile Club of America, and not satisfied that 600 miles represented anything like the end of endurance in this respect, the car was immediately despatched to Chicago to take part in the endurance run of the Chicago Automobile Club which was held under sealed bonnet conditions. Having successfully accomplished this also the car was again turned homeward to retrace the route to New York, rolling up a mileage of 3,219 miles when it finally got back to "automobile row." During all this time the car was run with the same seals on the bonnet, coil box, battery, change-speed gear case, rear axle and the like. The car was driven in both contests by W. H. Birdsall, and from the factory at Newark, N. Y., to Chicago and return by J. H. Stickney and J. David, while on the round trip to the factory it was piloted by F. Cimiotti, the New York agent.

### PERLMAN ACQUIRES THE AEROCAR AGENCY.

An interesting development in the selling end of New York's automobile row came to light in the announcement that C. A. Benjamin, vice-president and general manager of the Aerocar Company, Detroit, Mich., has just closed a contract with L. H. Perlman, of the Welch Motor Company, of New York, to also handle the Aerocar in this territory. The negotiations were carried on without the slightest hint leaking out, and the deal, which is of considerable importance, was quietly consummated before the trade had an inkling of it. Credit for the successful carrying out of the transaction is due in no small measure to A. M. Robbins, manager of the Aerocar Company's New York branch, to whom the matter of securing proper metropolitan representation for the 1908 Aerocars was entrusted. Knowing both the car and trade thoroughly, Mr. Robbins had no difficulty in settling upon Mr. Perlman as best adapted to carry on an aggressive campaign, while the latter had also been looking about for a medium-priced American car of established reputation and ability to handle for the season of 1908. Mr. Robbins has already made the car well-known in New York, while the car itself has made its ability a matter of common knowledge, so that in adding the Aerocar to the Welch Mr. Perlman found just what he had been looking for since the opening of the year.

### MOTZ CO. ELECTS OFFICERS FOR THE YEAR.

AKRON, O., July 8.—At its annual meeting of the stockholders of the Motz Cushion Clincher Tire Company the following directors were chosen: Charles Motz, Gus Burkhardt, Nick Seil, Dr. H. J. Saunders, William Wolf, N. C. Stone and Paul E. Bertsch. The directors then held an election of officers, Charles Motz being chosen president, Gus Burkhardt vice-president, Nick Seil secretary and treasurer. The company has completed preparations to make the new Motz non-skid cushion tire which has been perfected. In the immediate future particular attention will be devoted to foreign business, as the company owns patents covering the rights on its tire in Great Britain, Canada, France and Germany.

### AKRON TO HAVE FINE GARAGE BUILDING.

AKRON, O., July 8.—The Akron Automobile Garage Company, of this city, has just consummated the purchase of a site in the center of the business district and will immediately undertake the erection of what will be one of the finest garages in the State. The building is to measure 165 feet in length by 70 feet wide, and it will be of modern construction and fireproof.

AEROCAR BASEBALL NINE STARTING OUT FOR A GAME.

In Detroit an unusual amount of baseball playing material has been discovered in the automobile factories, and it now boasts of an Automobile Manufacturers' Baseball League, games being played every Saturday afternoon. C. A. Benjamin, vice-president and general manager of the Aerocar Company, is an enthusiastic promoter of the League and has organized the lively team shown in the picture among the Aerocar factory employees.

**DEATH OF A WELL-KNOWN TRADESMAN.**

DETROIT, MICH., July 8.—Roger J. Sullivan, secretary of the Wayne Automobile Company, died at the Colonial Hotel, Mt. Clemens, Mich., Tuesday, July 2. Mr. Sullivan had been suffering from uremia for some months and had been a frequent visitor to Mt. Clemens in the hope of getting relief. His condition was not considered grave until a few days before his death, and he had been able to devote a portion of his time to business matters.

ROGER J. SULLIVAN.

Although but 39 years of age, Mr. Sullivan had accomplished much in his lifetime. Entering the employ of a dry goods house when 14 years old, he studied telegraphy nights and was soon able to take a position as operator in the old Board of Trade office. From here he was called to a similar position in Chicago, telegraphers' paralysis, which developed two years later, necessitating his retirement from the key. Returning to Detroit, he entered the employ of a house-furnishing establishment, thirteen years ago starting in business for himself and at the time of his death having one of the largest furniture stores in the city. He organized the Wayne Automobile Company and was secretary of the concern from its inception. Mr. Sullivan's business interests did not occupy all his time, however, and he was identified with numerous fraternal and social bodies. The funeral was held Friday morning.

**MAXIM TO RESIGN FROM ELECTRIC VEHICLE CO.**

On August 1 Hiram Percy Maxim, who has held the position of chief engineer to the Electric Vehicle Company, Hartford, Conn., ever since the inception of the latter company, will sever his connections with it in order to devote his attention to some new developments, details of which are not forthcoming at the moment, but which will be made public later. Mr. Maxim is to remain in Hartford, and will open an office of his own there immediately his resignation takes effect.

His career in connection with the development of the automobile in this country is of considerable interest, as he was one of the first to devote serious attention to the subject. In 1895 he built a three-cylinder air-cooled engine, which was placed on a tricycle with a planetary change-speed gear. This machine attracted the attention of Colonel Pope, who purchased it in July, 1895, and engaged its builder at the same time, this event marking the genesis of the present Columbia car. The Columbia electric was also undertaken at the same time, and it is of interest to add that a number of the original Columbia electric phaetons are still in active service, which is a tribute to their design.

**RECEIVER FOR THE CRAIG-TOLEDO COMPANY.**

TOLEDO, O., July 8.—Granting the request of the involuntary petition in bankruptcy recently filed against the Craig-Toledo Motor Car Company by three of its creditors, the Carpenter Steel Company, the Harris Manufacturing Company, Reading, Pa., and Charles E. Miller, New York, E. J. Marshall has been appointed receiver by Referee in Bankruptcy Belford. The claims of the three petitioning creditors are said to amount to \$3,486.26, and it is reported that the alleged bankrupt has admitted its inability in writing to pay them. The liabilities are thought to total close to \$60,000. The Craig-Toledo Company is a comparatively new concern which has been assembling a limited number of cars at Dundee, Mich. It was the declared intention of the company to establish a plant at Monroe, Mich., the latter town having voted a bonus of \$10,000.

**CORBIN SPRINGS SURPRISE ON ITS AGENTS.**

During the past week the Corbin Motor Vehicle Corporation has been sending out a circular letter to its agents informing them of the plans of the house for 1908, and not the least startling assertion contained therein is the fact that they have decided to bring out a water-cooled car for next season. It is to be a 35-horsepower machine of the light touring type, seating five people and in every respect a modern and well-designed car. This does not mean that the Corbin air-cooled car is to be discontinued—quite the contrary. It has demonstrated its fitness in no uncertain manner in every contest that it has entered, and with a few minor improvements will be the subject of a greater amount of attention on the part of its builders during next season than ever. The new car has simply been designed to meet the very evident and general demand that exists for a medium-priced water-cooled car. The figure at which the new machine is to sell has not been determined as yet, but it is expected to have demonstrating cars of this model ready for delivery by October 1. The greatest surprise, however, is being held in reserve and will not be announced until later.

**IMPORTERS' SALON TO BE AN EXCLUSIVE SHOW.**

While the rules for the holding of the Importers' Automobile Salon, which is to fill Madison Square Garden with imported cars from December 28 to January 4 next, are practically a replica of those in force at previous shows, attention does not appear to have been directed to an apparently innocuous clause forming the end of paragraph III under Allotment of Space:

"No exhibitor shall be allowed to exhibit, who has, either directly or indirectly, through dealers or agents, exhibited automobiles in any show in Greater New York, between February 1, 1907, and December 28, 1907," a provision that is evidently aimed at importers who take part in either the independent or the licensed shows here this fall, as both occur within these dates.

**AMERICAN AUTOMOBILES FOR EUROPE.**

Fifteen hundred Dragon automobiles for southern Europe indicate that the American machine has made good in the Old World. Negotiations for the supply of this number of machines to Messrs. Perretti & Company, of Florence, Italy, have been completed by the Dragon Automobile Company, proving a distinct demand for a moderate-priced American machine capable of competing with the European product. Three hundred cars a year, for a period of five years, are to be supplied, to be distributed, according to the contract, throughout Europe, comprising Russia and Turkey and European States near the Mediterranean.

**SLIGHT CHANGES TO MARK ELMORES FOR 1908.**

CLYDE, O., July 8.—Details of the changes to be made in the 1908 models of the Elmore cars have been made public, from which it is learned that the only radical innovation to be made consists of the equipment with an improved form of rear-axle driving unit. Other modifications consist of refinement in the motor, giving it a capacity of six horsepower over its present rating, which, however, will remain the same, a reduction in the gross weight of the car by 200 pounds, the introduction of an improved pressure type of oiler, and the location of both sets of brakes on special drums in the rear wheel hubs.

**SPRINGFIELD, O., TO GET FRAYER-MILLER PLANT.**

SPRINGFIELD, O., July 8.—It is confidently expected here that the Oscar Lear Automobile Company, builders of the Frayer-Miller cars at Columbus, will remove its entire plant to this city within the next sixty days. The capital stock of the company is \$200,000, and half of this amount has been subscribed by local capitalists, while the local stockholders will also have a majority representation on the board of directors.

INDIANA'S FINEST GARAGE AT SOUTH BEND, IND.

## THE FAST GROWING GARAGE LIST.

### A Fine Automobile Installation at South Bend.

SOUTH BEND, IND., July 1.—Located one block from the Oliver Hotel, at 121-125 South Lafayette street, the Twentieth Century Motor Car Company has now one of the finest garages in the State of Indiana. The building is 65 by 160 feet, constructed of brick and concrete, without a post, the roof being supported by a steel frame. Ample light is obtained by large windows in the roof. A complete machine shop is fitted within the garage, equipped with all modern machinery, each piece being driven by an individual motor. There is a commodious waiting room for ladies, and the entire building is fireproof. Horace E. Kizer and M. L. Williams are at the head of the company, the latter gentleman being also chairman of the Touring Committee of the South Bend Automobile Club.

### Springfield's Latest Automobile Home.

SPRINGFIELD, MASS., July 1.—A new automobile garage has been opened at 22 Taylor street by the Geisel Automobile Company. The frontage on Taylor street is 56 feet, of plate and prismatic glass, with a 14-foot door in the center and an office on the right. Particularly roomy and well equipped, the garage has, among other conveniences, six 16-inch ventilators to remove exhaust fumes, three steel receptacles for oily waste, six drop lights with 20-foot cords for inspection of cars, and three long brackets, with ball-and-socket joints, to throw light on any part of a machine. A large skylight gives illumination from overhead.

## NORWALK'S MODERN AUTOMOBILE STATION.

NORWALK, CONN., July 8.—This city, which is situated on the direct route from New York to Boston—probably the most traveled automobile route in the country—can boast of station and repair facilities that are quite in keeping with its prominence as a

NORWALK AUTO STATION ON THE BOSTON-NEW YORK ROUTE.

stopping place on a main automobile route. The photographs illustrate the exterior and interior of the new garage of F. W. Lockwood & Company, which is located at 39 Wall street. The building is constructed of ornamental pressed concrete blocks, with a concrete floor, and is in every other respect both fireproof and of modern design, besides being equipped with every facility for the maintenance and repair of a large number of cars.

### NOTES OF THE GARAGES.

Wheeling, W. Va.—At Sixteenth and Chaplaine streets Jason Stamp has built a large garage, which, when complete, promises to be one of the best automobile establishments in the Central West.

Sturgis, Mich.—A two-story automobile garage, with a floor space of 30x110 feet, has been commenced here for J. R. Kirkpatrick. A well-fitted machine shop is comprised, and a full supply of accessories will be carried. It is contemplated handling the Matheson and other agencies.

Portsmouth, N. H.—Negotiations have been concluded for the lease of August Hett's property, at the foot of Brewster street, for an automobile garage and repair shop. Wharf room has also been obtained at the South End, where a large gasoline tank will be erected from which to supply motor boats.

INTERIOR OF F. W. LOCKWOOD &amp; CO.'S NORWALK GARAGE.

Ligonier, Ind.—A new two-story garage, 44 feet by 60 feet, provided with a first-class repair shop, has been opened here by T. A. Graves. In view of the passage of the Glidden tourists, the proprietor is preparing to carry an extra large supply of gasoline, and will make regular rates on all materials.

La Grange, Ind.—Two of the strongest points of interest in this town are at the La Grange Machine Works, where H. W. Lampman, an old Chicagoite, has a first-class repair installation, and the new garage (60x60 feet) which is now being run up for C. W. Timmes, and which promises to be thoroughly up-to-date.

Reading, Pa.—At the Berks Auto Garage Company on Cherry street, Reading now possesses one of the best equipped garages in the State. Its installation comprises large storage room, machine shop, handsome office, with private room attached, together with bathroom for the benefit of employees. The company has the Jackson, Stoddard-Dayton and Maxwell cars.

Pittsburg, Pa.—The downtown garages of Pittsburg are doing such a business this year that it is freely predicted that in 1908 many of the East End garages will be abandoned. The latest concern to move downtown is the Standard Automobile Company, which has taken an entire floor in the new Century Building, in Seventh street. Other firms which have felt the downtown boom are the Banker Brothers Company, in Diamond street, and E. D. Nevin, who is selling Darracqs at 507 Wood street.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

At the last meeting of the American Motor Car Manufacturers' Association the Gearless Transmission Company of Rochester, N. Y., was admitted to membership by the committee on management.

The Carter Motor Car Corporation, of Detroit and Washington, and which has branch offices in various cities of the country, is now building a factory at Hyattsville, Md., to supply the demand for their cars in the East and South. This concern holds patents on the Carter two-engine car which is being exhibited at the Jamestown Exposition.

Harry E. Dey, who drove the big six-cylinder Pierce Pathfinder on the mapping out run for the three A's tour, started to go over the same route at the wheel of the same car again on Wednesday when the tourists left Cleveland. The car, which was the first six-cylinder turned out by the Pierce company, had already covered 31,000 miles before starting on the pathfinding trip.

At a meeting of the creditors of the Four Wheel Drive Wagon Company, of Milwaukee, Wis., a dividend of eight per cent. was declared, and it is thought that a second dividend of the same amount will be paid before the affairs of the defunct company are settled. The proved claims now on file amount to \$190,000, and the Fidelity Trust Company, the trustee in bankruptcy, has about \$36,000 on hand for distribution.

Since the unusually successful completion of the contest held by the Automobile Club of America, a number of cars have developed the "sealed bonnet habit." The Haynes runabout, which scored a victory in the New York to Albany run and which later competed successfully in the sealed bonnet contest, is one of them, and is still running with the original seals intact. The car is being driven by C. B. Warren, who piloted it in both of the contests.

It is reported here that the Light Inspection Company, of Hagerstown, Ind., has just received an order from an Indianapolis concern for \$80,000 worth of a new type of four-cylinder automobile engines, which are the invention of C. N. Teeter. The company is preparing to enlarge its plant and greatly increase its facilities in order to take care of the extra work involved, the building of gasoline automobile engines being a new departure.

It is interesting to note that out of the seventy-one entries for the A. A. A. tour now under way thirty-seven of the cars are equipped with Diamond tires. In order to facilitate tire repairs en route, the Diamond Rubber Company has accordingly made arrangements to send along a traveling stock of tires so that the contestants will be relieved of the necessity of carrying a number of extras. These are being carried in a touring car fitted with a special body to accommodate them and which will be in charge of H. G. Smith, of the Cleveland Diamond branch. About one-half of the cars are equipped with quick detachable rims among which the Marsh figures prominently.

Under the title of "Route Book No. 4," the White Company has just issued detailed road directions for reaching the Jamestown Exposition via the "air line" route by way of Philadelphia, Wilmington, Dover and Cape Charles. Supplementing the instruc-

tions for reaching the exposition is an illustrated article replete with useful hints for tourists contemplating a trip in that direction. Road directions are also given for a tour from Baltimore, over the national highway to Frederick, and then by way of Harper's Ferry to Halltown, W. Va., where connection is made with routes north and south, described in the White Route Book No. 2. A feature of the book that will be appreciated is a fine double-page map. Copies will be sent gratis on application to the White Company, 300 Rose building, Cleveland, O.

### RECENT TRADE REMOVALS.

The Randall-Faichney Company, maker of the well-known B-line oil and grease guns, has moved from the Sudbury Building to 251 Causeway street, where it has secured new quarters, affording 16,000 square feet of floor space. This increase in facilities will enable the company to take care of the increased demand for its products that has been manifest for some time past.

The Automobile Sales Corporation of New York, with quarters at 1662 Broadway, near Fifty-second street, is now selling the 1907 product of the Daimler Manufacturing Company, of Steinway, N. Y. The company has recently removed to large new showrooms at this address and is making immediate deliveries of the American Mercedes cars, which are still being handled by J. J. Evans.

### NEW AGENCIES ESTABLISHED.

The Brown-Friend Motor Company, a newly formed concern, of which the members are G. W. Brown and Otis C. Friend, both well known in Chicago's motor colony, have opened for business at 230 Wisconsin street, Milwaukee, Wis., and will handle the Mitchell agency for that and neighboring territory.

Under the management of William C. Chambers, formerly of the Hamilton Auto Company, and with J. M. Hannick as a partner, the Universal Auto Exchange was recently opened at 1352 Wood street. A full line of automobile accessories of every kind will be carried, including a complete stock of tires, Mr. Hannick being conversant with this line through his former connection with the Michelin tire agency in this city.

### PERSONAL TRADE MENTION.

W. Wayne Davis, formerly with the Keystone Motor Car Company of Philadelphia, has taken charge of the Peerless department of the Quaker City Automobile Company. Mr. Davis is one of Philadelphia's pioneer automobile salesmen.

Frank H. Burmester, of the Burmester Rubber Company of Boston, has severed his connection with that concern and gone with the Firestone Tire and Rubber Company of Akron, O., in the capacity of New England traveling representative.

J. B. Kavanaugh, formerly with the Hartford Rubber Works, Hartford, Conn., has severed his connection with that house in order to assume the management of the Cleveland branch of the Fisk Rubber Company and will immediately enter upon his new duties.

R. E. Olds, president of the Reo Motor Car Company of this city, and chairman of the legislative committee of the American Motor Car Manufacturers' Association, sailed for the other side with his family on the Fraf-Waldersee. He will remain abroad for two months, most of the time being spent on the Continent in the dual pursuit of pleasure and business, automobile conditions being studied with a view to arranging for the placing of Reo agencies.

Ezra E. Kirk, formerly general sales manager of the E. R. Thomas Motor Company, Buffalo, who recently resigned to go into the garage business at Toledo, O., under the name of the Kirk Bros. Automobile Company, has just sold his interest in the latter concern and has retired as president and director of the company, H. W. Fraser having been elected to the office in his place. Mr. Kirk has been such an active participant in automobile trade affairs for some time past that it is hardly likely he will remain long out of business, and he will doubtless be heard from soon.

### M. J. BUDLONG RETIRES.

Milton J. Budlong, for four years president of the Electric Vehicle Company of Hartford, Conn., has resigned, to take effect September 1. He will take a long and much needed rest before announcing his future plans. His successor has not yet been named.

Mr. Budlong is one of the best known men in the automobile business in this country. For nine years he has been connected with the Electric Vehicle Co. in various capacities. He was treasurer, vice-president and general manager and latterly president, succeeding George H. Day when the latter became manager of the Association of Licensed Automobile Manufacturers. Mr. Budlong was connected with the Pope interests in their early days, and he later became secretary and treasurer of the Siemens Halske Electric Company, of Chicago. When Mr. Day became head of the Electric Vehicle Company Mr. Budlong became the western manager, in which position he remained until he was called to Hartford to take the position of vice-president of the company. He was subsequently elected president of the National Association of Automobile Manufacturers, and for four years has been one of the most active and successful of the younger men in the American automobile industry.

### LARGE STEARNS CONTRACT.

F. B. Stearns, of the Stearns Automobile Company, Cleveland, O., has just closed a contract with Wyckoff, Church & Partridge, of New York City, for the sale of the Stearns in the metropolis for the next three years. The minimum value of the cars to be sold in that time is \$3,000,000, thus making the contract one of the largest agency deals ever consummated. Wyckoff, Church & Partridge are not new to the Stearns, as they have been handling it for the past year and know what they can do with it in the way of sales, which accounts for the large guarantee.

## INFORMATION FOR AUTO USERS.

**The Universal Repair Bench.**—The greatest need of every autoist who takes care of his own car, and the number that do so is constantly on the increase, is an appropriate place to work, together with a convenient place to store his tools. These are provided in an up-to-date manner in the Universal Repair Bench, a photograph of which is shown herewith. It is manufactured and marketed by the Universal Repair Bench Company, Rochester, N. Y.,

UNIVERSAL REPAIR BENCH AND FITTINGS.

and is fitted with a high-grade swiveling vise and a bench block of special design, which will be found useful in a hundred and one different ways when making small or even serious repairs to an automobile. The bench itself is built of the best seasoned lumber, with a hardwood top, mortised and glued, and measures two feet wide by five feet long and three feet high. It is provided with four drawers, a cupboard and plenty of shelf room for the accommodation of tools.

**The Automatic Searchlight.**—Autoists have long felt the need of some device to cast the light of one of the headlights in the same direction as the car turns when rounding a curve, and use of such an aid to night driving would be general. O. E. Halderman of Marion, Ind., has given considerable study to the matter and as a result is now marketing what he calls an "automatic searchlight." The device consists of a vertical bracket supported on a two-point bearing, forming a support for the light, with an adjustable spring between

HALDERMAN'S AUTOMATIC SEARCHLIGHT.

the two points. It is attached to the frame or body of the car and is operated by means of a rod extending downward from the bracket, which connection causes the right-hand lamp to turn only when the car turns to the right, or to the left in the case of the left-hand lamp, thus leaving one lamp heading in the same direction as that in which the body of the car is pointing, while the other follows the line of the steer-

ing wheel and shows exactly where the latter is going when rounding a curve. When the car resumes a straight course the adjustable spring mentioned causes them to return to their normal straight-ahead position, as shown by the accompanying photograph of a car fitted with these brackets.

**Safety Relief and Cut-out.**—The Gray-Hawley Manufacturing Company, Detroit, Mich., are placing on the market, as an addition to their extensive line of specialties of this kind, an advanced type of muffler cut-out and safety relief, which is practical and durable as well as readily attached to any car. The safety relief feature consists of an opening governed by a nut and oil-tempered spring, the latter being placed outside, so that it is not affected by the heat. When installing it the spring is adjusted so as to keep the opening closed under normal conditions, so that when a charge is exploded in the muffler it instantly releases the pressure and prevents imposing undue strain on the latter. The valve body, lever and brackets are made of malleable iron. The valve runs in three guides, and is

GRAY-HAWLEY MUFFLER CUT-OUT.

ground into its seat, thus insuring a good fit. The bracket swivels on a lock nut and may be turned to any position desired, while the lever is also reversible, thus making it easy to install the cut-out without the necessity of using bell crank levers or other complicated means for its operation. The appearance and simplicity of the device may be judged from the accompanying illustration of it, showing it complete.

**Automobile Comfort.**—Under this title the makers of the Rough Rider Ventilated Spring Cushions, the Ventilated Spring and Cushion Company, Fisher Building, Chicago, Ill., have issued a neat booklet showing in a telling manner by means of text and appropriate illustrations the great advantages of their system of ventilated cushions over the ordinary kind, and also giving a partial list of American automobile builders who have adopted their springs as a part of the regular equipment of their cars. As the names include some of the most prominent builders in this country this is not the least valuable part of the booklet to the maker who is seeking goods of this character, for the average man usually wants to know who else is making use of a thing before he decides to try it for himself. Rough Rider springs are not the ordinary kind—just coils of wire between two braces

—they are special springs in many ways, but in addition, the spring cushions made by this firm embody a unique provision in the shape of an auxiliary set of springs, to take care of those unexpectedly hard bumps that bring the ordinary cushions down to their foundations when passing over them.

**Schoelkopf Lubricators.**—Probably not one autoist in a hundred could mention off-hand the various styles of lubricators that are used on the automobile, nor, for that matter, can the average driver tell an inquirer just how the particular device that is on his own car operates. For this reason

SECTION SHOWING PLUNGER AND VALVES.

the pamphlet issued by the Schoelkopf Manufacturing Company, Madison, Wis., under the title of "A Treatise on Mechanical Lubrication," is of more than passing interest to those who are not as familiar as they might be with this most important essential. It reviews all the standard types of force-feed lubricators on the market, with an explanation of the principle on which they work, and shows, moreover, how they differ from the Schoelkopf lubricator, sectional illustrations of which serve to show its simplicity. It also sums up the ideal lubricator as follows: "An exceedingly simple and positive method of conveying oil to the various parts of the motor and car, from a large container, and means for showing at a glance the amount of oil passing through each lead, with force sufficient to be unaffected by temperature variation or particles of foreign matter in the lubricant."

SCHOELKOPF LUBRICATOR NO. 26.

The Schoelkopf lubricator is the result of five years' study of the problem, and its pump embodies all the simplicity of the regular check-valve type, with its great objections eliminated, as will be seen from the illustrations depicting a sectional view of the barrel, showing the plunger and valves.

### NEW TRADE PUBLICATIONS.

From the Morgan & Wright factory at Detroit a couple of neat folders have come forth in praise of the firm's well known products. The subject of good tires is handled, convincing arguments being put forth to prove this quality in the Morgan & Wright article.

# THE AUTOMOBILE

BIG TOUR IS PROVING THE ENDURANCE  
OF THE AMERICAN AUTOMOBILE

BY A. G. BATCHELDER

CHICAGO, July 15.—Somewhat impatient from its two-day inings of idleness, the autoing cavalcade this morning resumed its strenuous—the word fits exactly—tour, for a tour can be an endurance contest even though a contest is not necessarily a tour. It might be said right here, and said unmistakably, that any American automobile—the importers ignored the opportunity—which survives this A. A. A. 1907 tour, either with a clean score or with minor penalizations, will have just cause to declaim from the housetops its staunchness and reliability in meeting extraordinary touring conditions. And in this country, compared with the general run of European highways, our roads when traveled for any great distance usually require these extraordinary conditions. They cannot be escaped.

Pleasure is incidental to this fourth annual event of the Three A's, and while there may be several who looked upon the affair as a jaunt rather than in the light of a contest, the greater part of the participants had no false notions as to the nature of the 1,570-mile ride that began in Cleveland and will end in New York City. It is not a mere struggle for the possession of the Glidden and Hower trophies, but the real prizes sought are the commendation and patronage of the automobile-buying public.

Forty-two of sixty-one automobiles faultlessly survived the hard Cleveland-Toledo section, the more difficult Toledo-South Bend run, and the South Bend-Chicago trip, which had its greatest task in the plowing of the quagmires of the city's squalid South Side. A dozen non-contestants, unfettered by rules and

WHERE THE OFFICIAL CLOCKERS CHECKED THE CARS ON THEIR ARRIVAL AT THE AUDITORIUM ANNEX, CHICAGO.

PART OF THE LINE SNAKING ITS WAY THROUGH THE SAND.

HELD UP AT THE DRAWBRIDGE OUTSIDE SOUTH CHICAGO.

controls, extracted considerable enjoyment during the three days. When this endurance tour—that is the proper designation—is over and its results are summed up, it will be recognized as having been beneficial to the industry and pastime, for the more perfect the automobile of the maker the more perfect is the pleasure of the user. From these long runs—no matter if the rules have been uneven, the rulings of the officials subject to criticism, and the roads good, bad and indifferent—every participant has learned something. If a manufacturer, he discovered weaknesses of construction which he quickly corrected; if a user, it may have caused him to discard what he owned for something which he had observed contained greater reliability.

The interest of the public is keen in the automobile, and through Ohio and Indiana the 1907 touring brigade has become aware of the fact that many a farmer met with along the road no longer regards the motor-driven vehicle as an interloper, but, his horses now seldom scared, he has in mind the buying of a car himself, and is looking about to find the one which best will suit his needs. Now and then there was to be seen the thrifty agriculturist who already had invested in a car, over which he betrayed the pride of ownership.

There have been courtesy and greetings all along the way, in the country as well as in the city, and an occasional banner has accentuated the welcome. It is as hard as usual to disabuse the average onlooker at the flying procession of the idea that there is no race, and he will persist in urging one to "hit her up," trying to lend encouragement by saying that the car in front has just passed. Occasionally there is a brush on the road, despite the rules, but as a whole the entire caravan, including the free lances, are considerate of other users of the highway.

It was not to be expected that Chairman Hower would find approval from all quarters, and his desire to shoulder the entire

burdens of direction aroused some antagonism even in his own committee, so much that L. E. Myers, the Chicago member, handed his tour badge to the chairman at South Bend. But the chairman is a worker, and the summary of the tour will have to tell whether he has accomplished his somewhat self-imposed wholesale task in a manner satisfactory to the A. A. A.

Since the tourists with few exceptions have trade affiliations of some character, a great many hiked for the places of their Chicago representatives soon after their arrival here, and as a result the entertaining was scattered in many directions. But there were, and will be during the remainder of the tour, those who prefer long hours of sleep instead of the well-meant attentions of the entertainers in the various cities. Rest is a fine form of enjoyment after one has swallowed dust galore and bumped the bumps for many painful hours. No, this is not a pleasure tour, and 'tis fortunate that a few gained a false impression of what the thing is and was meant to be.

Back to South Bend will be easy, from there to Indianapolis is good going; the roadway to Columbus should be satisfactory, and on to Canton there will be average traveling. But to Pittsburg strenuousness will be apparent, and from Smoketown to Shady Bedford there'll be a ride which will make the Springs a blessed spot to reach on Saturday night for a stop over Sunday.

Yes, the tour is worth while at this time. About next year—that is a different matter. Many are already agreed that there should be a next year—that the tour is of decided benefit to the industry as a whole, and not a few are keenly observing conditions and the working of the present set of rules and regulations, with a view to their improvement when the opportunity comes. There is little doubt that if these wise ones get together and air their views there will be considerable to be said—but then, of course, that's too long a story.

SOMETIMES THE ROADS WERE EXCELLENT, LIKE THIS.

BUT MORE FREQUENTLY THEY WERE BAD, LIKE THIS.

**P**ARTICIPANTS in the A. A. A. tour are agreed that the affair now in progress is the greatest from every point of view that has ever been held in this country. While, in my opinion, some changes in the rules can profitably be made for 1908, it must be admitted that the present ones have worked out much better than many expected. While it is true there is some complaint about fast schedules over execrable roads, there was a general understanding that the affair was not to be of the lawn tennis order, but rather a tour that would test cars and drivers. Nevertheless the nine-hour schedule for the 166 miles from Toledo to South Bend, announced the night before and not lengthened after a five-hour rain, was too fast for safety, to say nothing of comfort, and was an injustice to the cars of 24-horsepower or less. That distance over such roads in nine hours endangered everyone and cheered the hearts only of those driving road locomotives of the 60-horsepower type.

That this schedule was wrong is now admitted, and although each day will see a timetable fast enough to test cars, yet it will always be within the bounds of safety and within the speed limits of the various localities. Anything to the contrary would injure the pastime in every town through which the tour passes and tend to bring about legislation of the unfair sort that will affect the industry; and as 95 per cent. of all cars entered in the tour are from the trade with factory experts furnished for the others, the maker is entitled to some consideration.

It is absurd to believe that any great number of amateurs can be found who will slam their own cars over the roads on a time schedule, eating the proverbial "peck of dust" daily simply to participate in the Glidden contest.

After participating in these tours from their inception I have reached the conclusion that a pleasure jaunt and a test of cars cannot be combined. Moreover, I am convinced that no satisfactory set of rules or schedule of running can be promulgated unless it involves the factor of price. Primarily these contests are for the benefit of the public, and who will deny that possible buyers are most interested in knowing the best car they can get for a certain sum of money? Yet when a 16-horsepower car of \$1,250 is required to make the same time and comply with the same rules as a 60-horsepower machine costing \$6,500 it is unfair to the small car at the time, and unfair at the finish to the large car, which can boast of no

better performance than that supplied by the lower-priced one, albeit it was capable of accomplishing more where the smaller machine had been at its limit.

After giving the matter a little thought and noting the performances of cars on the run, it would appear as though cars selling for less than \$2,000 should be required to average fifteen miles an hour; those selling from \$2,000 to \$3,000 to make seventeen miles an hour, with nineteen miles for cars selling for \$3,000 or more, and a slight increase for the runabouts. In case of severe rains a slower schedule commensurate with road conditions could be enforced.

When one sees cars disqualified for replacing small parts, instead of allowing them to continue with a penalty, it would seem as though future tests should permit of small repairs such as might be done by an owner on an ordinary tour, charging some by a deduction of points. This involves the matter of observers, and I am free to say that observers are the most satisfactory where an award of any sort is to be made.

That a schedule of some sort is required to properly test cars is admitted. It should not be so fast as to cause the affair to degenerate into a road race, nor should it be so slow as to permit too much work to be done on cars. If a fast schedule is to be followed, no passengers or baggage should be required in the cars, and entrants should be permitted to do anything to help supply the speed.

Properly conducted tours help the industry, but unsanctioned racing on the public highways brings discredit on everyone concerned. Racing, however, is a fever that is contagious, and it can hardly be cured by any other measure than the providing of a pacemaker, who must not be passed by any contestant, but to whose time shall be added half an hour or so in favor of the competing cars to give them an opportunity for filling fuel tanks,

oiling moving parts, replacing punctured tires and making slight repairs. The reliability of cars finishing under such conditions would admit of little argument.

The present tour is a wonderful demonstration of strength and reliability in American machines. Not a foreign car owner elected to undergo the test. Troubles have been of little moment, being mostly in bearings, springs and running gears. Of motor troubles there may be said to be none.

It seems to me that many American makers lose a grand

A. N. JERVIS' BERLIET, A "SEALED BONNET" GLIDDENITE.

COEY IN HIS THOMAS WINNING THE "24" AT HARLEM TRACK.

opportunity to study conditions by failing to either enter a car or to have a factory expert on the trip. The representative of a company which sold \$2,000,000 worth of cars last year stated publicly that they learned some way of improving their product in every contest of this sort and expected always to enter them.

Chairman Hower and Secretary Lewis of the A. A. A. touring board, with their assistants, have worked nobly and with commendable results. They will all learn much from this tour which doubtless will be reflected in the rules for the event of 1908.

### THOMAS WINS CHICAGO'S TWENTY-FOUR HOUR.

CHICAGO, July 16.—C. A. Coey (Thomas) was the winner of the 24-hour race held on the Harlem track from 4:45 P.M. Friday to 4:45 P.M. Saturday. Coey's mileage is 846, which, owing to the poor condition of the track, was far below the 1,135 miles two-car record established three weeks ago by Ford machines at Detroit. Mongini (Matheson) was second with 842 miles; Wagoner (Haynes) third with 813 miles; Foster (Cadillac) fourth with 794 miles, and Zirber (Mitchell) fifth with a score of 719 miles. The attendance was large and more cars were never before seen at a track meet.

No sooner was the result announced than it was stated that a protest would be lodged by the Matheson representatives on the ground of inaccurate scoring, points specially mentioned in the document being "that the two Thomas cars were on the track together, both being scored by the officials; that for five laps no record was credited to the Matheson; that 75 per cent. of those present supposed that the Matheson had won." The matter may be brought before the Racing Board of the A. A. A. for adjudication.

A challenge has been issued to the winner by the White Company of Cleveland, conditions of the contest to be the same as on the Harlem track, with details to be settled at the convenience of both parties. Steam cars were barred from the 24-hour and also the sprint races.

Wretched track conditions are alone responsible for the low mileages recorded by the competing cars. The surface was so soft that deep furrows were plowed in the dirt, and the drivers

were obliged to follow these tracks to make any speed at all. To remain in the game any length of time called for almost super-human efforts on the part of the drivers.

The Maxwell car, the famous "No. 13," remained on the track the greatest length of time and was running well until the twenty-third hour, when it was bumped into by Mongini's Matheson, sustaining a broken rear axle. After running three turns, a Pope-Toledo blew out a cylinder. The car was removed from the track, a new cylinder fitted, and on its return did forty-five miles in one hour—the fastest going of the day.

Some of the short sprints were abandoned owing to track conditions, the brief results of those which were held being as follows:

#### THREE-MILE EXHIBITION AGAINST TIME.

1. Haynes, 35-horsepower; driver, Miss Alice Tetzner.... 6:02

#### FIVE-MILE MATCH RACE.

1. Packard, 30-horsepower; driver, Otto Lehman..... 7:16
2. Jackson, 35-horsepower; driver, Burman.

#### JOHN CONDON STAKES, TEN MILES.

1. Apperson, 50-horsepower; driver, Phil Kirk..... 14:58 1-5
2. Packard, 30-horsepower; driver, Otto Lehman.
3. Haynes, 50-horsepower; driver, C. W. Birchwood.
4. Apperson, 50-horsepower; driver, Eddie Bald.

#### FIVE-MILE DASH, FREE-FOR-ALL.

1. Apperson, 50-horsepower; driver, Phil Kirk..... 6:32 1-5
2. Pope-Toledo, 50-horsepower; driver, George Schoeneck.
3. Apperson, 50-horsepower; driver, Eddie Bald.
4. Thomas, 35-horsepower; driver, C. A. Coey.
5. Jackson, 35-horsepower; driver, Burman.
6. Haynes, 50-horsepower; driver, C. W. Birchwood.

The meet was conducted under the auspices of the Chicago Automobile Club by the United States Automobile Racing Association, it being understood that the club was to supply the officials. In order to have scorers who would serve all night it was necessary to use hired men, and here is where the charge of incorrect scoring had its genesis. It is safe to say on the next occasion that this feature will have greater attention from the club and similar annoyances avoided.

On the other hand, however, it is definitely stated that the Matheson team did not receive credit for several miles because of illegal pick-ups. When Mongini was relieved by his teammate the latter would not wait until they were on an equality, but would sometimes run out on the track nearly an eighth of a mile ahead. He was not officially considered in the race until he was alongside his mate. There is a probability that the protest will be simply one of newspaper shouting only, because exact evidence seems to be wanting, though such protests naturally detract from the interest of the meet, and due precautions should be taken to guard against conditions which make them possible, in the interest of clean sport.

AN EXCHANGE OF GREETINGS BETWEEN THE PILOTS OF THE LARGE AND SMALL STEAMERS.

COMMANDER LEWIS OF THE CONFETTI BRIGADE IN PREMIER "SIX."

MAXWELL CONFETTI CAR WITH LIEUT. MORT REEVES IN CHARGE.

THE STUDEBAKER WHICH ESCORTED US OUT OF SOUTH BEND.

ON the floor above the last feeble strains of a waltz were dying as one reluctant leg followed the other over the bed-edge in response to the unwelcome "Three forty-five, sir" call.

Laying the confetti for A. A. tourists is of necessity a natural occupation, appreciated by Chairman Hower, Globe-girdling Glidden, Pathfinder Dai H. Lewis and their few assistants who bustled around the Oliver Hotel at South Bend, electrifying the drowsy hallboys. Confetti car for the occasion was the Premier "Six," just six days out from the factory, and its cargo, Dai H. Lewis, all eyes for the odometer and the road book, and Roy MacNamara occupied with steering wheel and throttle. A sack of confetti and numerous traveling bags shared the tonneau with Designer George A. Weideley of Premier interests, and the scribe, who completed the car's complement.

"Is that odometer set back? Come along, boys! Swing it out thick on that corner; now some more on the next turn," spake the commander of the procession. For it is not a single car, but a procession that is required for blazing the way of the Gliddenites. Ahead, a speedy Studebaker runabout, piloted by local automobilists, showed the way out of the town, the official Premier followed, behind it was a Maxwell runabout with a reserve of confetti, and in the rear the big Pierce, in which the Cup donators watched the proceedings.

Michigan avenue being in the hands of the repair men, a detour of a couple of miles over narrow country lanes had to be effected, then the main road was struck again and the machines bowled along over a fair surface, deserted except for an occasional farm wagon carrying market produce to South Bend.

Down the road a couple of wagons were observed advancing. Studebaker passed them both with barely a slackening of speed. The Premier "Six" went by the first with a nod to the farmer and his cooped-up chickens of all ages, and was approaching the second equipage when it was noticed that Dobbin was restless. Instantly driver MacNamara cut out his ignition and the machine ran along silently toward the two ladies and the hesitating old horse. The road being banked high, it needed but a slight rearward movement of the animal for the buggy to drop down a couple of feet, dragging the horse after it, overturn, and throw the two ladies out from under their umbrella into the long wet grass.

One minute later the younger of the ladies was up on the road, thanks to the agility of

Dai Lewis, and had ceased her shouts of "Father!" Mother came out with cries and lamentations of "O, my eggs!" When father had leisurely hitched up his horse and as leisurely walked back to his spouse and offspring, both had recovered from their surprise and were aiding the automobilists to repair. It took but half an hour to turn the frail, undamaged buggy right side up and gather together what remained of the six boxes of eggs—Dai Lewis declares there were half-hatched chickens in lots of them.

"Mister Farmer," said Chairman Hower, "your wife is to blame for this accident, but we are willing to help you out Will \$10 pay for your broken eggs?"

"Twenty-five dollars wouldn't half pay me for them there eggs."

Angry words seemed probable, when George A. Weideley, at whose motionless Premier the horse had shied, slipped another note into the farmer's hand.

"You're a gentleman, sir, you are; you're all gentlemen," and smiles took the place of frowns. Chairman Hower delivered a lecture as to how to act on the approach of an automobile and Charles J. Glidden supplemented it from his bottomless stock of experiences.

Beyond New Carlisle a perfect macadam surface allowed some of the loss to be regained, the confetti car and its escort sweeping along at a brisk rate without the suspicion of a jolt to passengers perched on the rumble seats behind.

A score of times the procession came to a standstill, while nervous horses were led by the machines, and on each occasion the occupants of the chairman's car gave kindly advice, telling particularly when there were ladies that if the hand were raised as a signal every one of the three-score machines in the tour would stop and wait until the horse were led by.

Did every automobilist follow the gentlemanly example of Chairman Hower there would be no disgusted horse drivers and no need for legal speed restrictions.

When the South Bend pilot had cast us off and turned eastward again, and we had set all Michigan staring at our paper trail, Confetti Chief Lewis became pathfinder-in-chief. Road repairs had rendered the original route impracticable, and a new trail had to be laid out. Almost at every turn the procession came to a halt while the leader interviewed the occupants of a roadside house or went in search of inhabitants when none were in sight.

THOMAS PRESS CAR THAT HAD A "FULL HOUSE."

"It's the hardest thing in the world to get information," said Chief Lewis. "Not one man in fifty knows anything about the roads ten miles from his home."

But we blazed out a way. Down narrow lanes which might have been traced by a rolling early-morning reveler; along tracks which lingered, as if magnetically bound to the iron way; through slumbering villages bursting into life at the sound of the autos, and over fair blossom-bordered highways.

Suddenly the Premier's nose went into a soft, oozy bed of mud of unknown depth and settled down, reluctant to leave it.

Chief Lewis momentarily paled, hesitated and appeared to weigh the chances of a retreat and a search for another track against a forcing of the passage.

Chairman Hower glanced nervously down the road, fearful of the thundering arrival of the first speeding competitors.

"We must go through this," exclaimed Lewis.

When she had been coaxed out sufficient to clad the rear wheels with chains, the Premier six-cylinder purred in deep, quiet tones and the big mass sliced a way through the axle-deep

mud an inch at a time, so slow was the progress of an advance. Onward was a fast clip into Hammond, with only an occasional dropping of confetti on the turns. It was useless sprinkling the clean white paper on Chicago's black, oozing mud and water covered inlets of the South Side, and it was only by tearing up every scrap of paper in the car that the trail could be stretched out through lakeside parks to the First Regiment Garage. In all my experience I've never seen worse streets than those which we encountered in those filthy, ill-smelling sections of Chicago, and the transition into the beautiful parks was like a step from Hades to Paradise. It seems absolutely inconceivable to one new to the country that of one of its largest cities, and presumably rated as being in the first class where American centers of population are concerned, should tolerate the existence of such pest holes and morasses of filth that are characteristic of Chicago's South Side. The city was a stench in the nostrils of the tourists, due to the necessity of passing through such parts of it in entering and leaving, and the good clean mud of the country roads was not half as repulsive as it might have been but for the comparison.

## WHAT THE MAN BEHIND THE WHEEL THINKS OF IT

By A. B. TUCKER.

JOHN W. HAYNES, who was piloting the Dragon runabout, No. 112, thinks he has as good a chance at the Hower trophy as any of the "perfect" score runabouts. He said on Sunday that the 12 points he had lost were because of fan-belt trouble between Toledo and South Bend. He had to replace the belt eight times, and the heavy going prevented him from making up all the time which he had lost. He thinks there will be several others who will have marks against them before many days. Mr. Haynes said the little Dragon is running well and is in good condition and had no complaint to make regarding the management of the tour. He said he thought the daily schedule might be made a bit more cleverly, but, aside from that, he thought that Chairman Hower was doing as well as could be expected.

J. W. Mears, who is driving No. 43 Acme, says he has found the schedule too fast for sane and safe driving, unless one is willing to rap his car. "On the run from Toledo to South Bend," said Mr. Mears at Chicago, "I found, soon after starting, that I was up against a road the answer to which was 10 miles an hour, and I cut her down to that whenever the roads demanded it. My maximum that day was thirty miles, which is all I considered to be safe under the conditions. I did not touch the engine nor, in fact, have I had to do any work on my car since the tour started, and she is running as smoothly as a sewing machine. But the careful driving I did and the fact that we were delayed on several occasions by other cars which had skidded across the road and blocked it and needed help, or were hanging half over bridges, and so forth, was the cause of my taking a penalization. I took this gladly, for I would rather have

a car to hit the bumps and hills of next week than a clean score at this time. I am morally sure that none of the cars which have persisted in making schedule time up to now are in the tight, trim, just-from-the-factory condition, which is the case with my Acme."

Mr. Mears said that he was confident of finishing the tour, and thought he would be in better shape at the close of it than some of the cars which have a clean score now.

Charles Burman, who is driving the No. 49 Peerless, said at Chicago: "Mr. Straub, who is driving the No. 50 Peerless and myself have had no difficulties of moment since we started. We have each had a little tire trouble, but beyond that have not at any time felt at all insecure about making our night stops on schedule time. Both cars are running nicely and I see no reason why we should not keep up the good work. The second day's run was a severe one, but it is entirely probable that we may have worse before we close our run. With good springs under us, dependable engines and reasonable schedules, I do not care what regulations the committee makes, I think we can meet them.

"This year's tour is undoubtedly a harder one than that of last year, even when the roads are good. With continued rain it may be an exceedingly hard one in the Pennsylvania mountains. But I am the leading member in a flourishing 'don't worry' club of one, and am not borrowing trouble for next week.

"Chicago entertained us well, and I think there should have been a vote of thanks on the part of the tourists for the pleasant program prepared. I am for another tour next year, but I think it ought to be one thing or the other.

RAILROAD TRACKS WERE PLENTIFUL APPROACHING CHICAGO.

PEACEFUL FARMHOUSES DOTTED THE NORTHERN INDIANA ROADS.

LINED UP FOR THE START OPPOSITE A. A. HEADQUARTERS AT THE HOLLENDEN IN CLEVELAND.

CHICAGO, July 13.—Thirty-one machines out of forty-six competitors for the Glidden trophy traveled from Cleveland to the First Regiment Armory, thus accomplishing the first leg of the great American touring contest, without a single penalization being recorded against them. Fifteen have already stumbled by the way, incurring penalizations from four, in the case of Mrs. Cuneo and her Rainier to maximum points, making all further effort superfluous. Five at least will take no further part in the contest, some of them retiring definitely, others jogging along for the eastward journey as simple non-contesting tourists.

Of the twelve starters for the Hower trophy, eight are without spot or blemish, one has abandoned and three have penalizations.

Three touring machines set out to compete for perfect score certificate without entering the Glidden trophy, and all three have reached the shores of Lake Michigan without the loss of a point. J. G. Barclay's Thomas Forty, originally entered as a Hower contestant, withdrew after a perfect score on the first day in order to be free to attend to Warner Speedometer business for the remainder of the trip. J. L. Zimmerman's Locomobile started and continues as an independent.

Twelve machines are doing various kinds of service work, carrying officials, pressmen, tires, etc., or running independently with non-competing tourists. All have reached Chicago, two only being delayed en route by mechanical troubles.

Club competition, which forms the basis of the Glidden trophy contest, has worked down to a tie between the Automobile clubs of Buffalo and Pittsburg, both with perfect scores, with New York Motor Club suffering a loss of only 13 1-5 points, and others trailing out as follows: Cleveland Automobile Club, 144 7-9 penalization points; Automobile Club of America, 251 1-2; Automobile Club of Detroit, 266 1-2; Westchester Motor Club, 336, and Chicago Automobile Club, 343 points.

#### Facts About the First Day's Run.

Behind the huge mass of idle spectators, interested automobilists and equipped touring machines crowding the roadway in front of the Hollenden Hotel at Cleveland, July 10, there was an excellent organization which sent the 61 machines engaged in the A. A. tour away on their 1,500-mile journey with perfect regularity.

No sooner had Cleveland's fine asphalt boulevards been left behind than the real struggle began, the machines entering upon Ohio's embryo roads, straight as any highway the Romans laid, but often rocky and uneven as any track of virgin country. Weather conditions, however, were favorable and practically all the machines were able to stand the merciless pummeling for the 121 miles separating Cleveland from Toledo. Seven hours had

been allowed for the journey, thus calling for an average speed of about 17 1-2 miles an hour. As, however, allowances had to be made for moderate travel through towns and villages, almost double this speed had to be attained in open country.

It was a remarkable testimony to the value of the American machines engaged in the contest that, over roads the like of which can be found in no other civilized country in the world, but two machines should fail to arrive according to schedule.

No. 7 Welch in approaching a narrow wooden bridge at the foot of a slight grade collided with the metal part and severely bent the front axle. Fortunately a blacksmith's shop was close at hand and the injured member was instantly put under repair, not without, however, the eventual loss of ten points for late arrival and two points for new bolts.

No. 109, Continental, C. S. Johnston, met with a road accident which caused him the loss of 24 points. When close pressed by a competitor in the rear, he struck a heap of rocks, completely breaking the frame of his car just above the front axle. A couple of metal bars clamped on each side provided a remedy probably sufficiently strong to carry the car to the end of the tour, but too much time had been lost in fixing the stays to meet the requirements of the running schedule.

Among the non-contestants, No. 92, Haynes, "Old Dobbin," carrying pressmen, had to be towed to a garage with a damaged rear axle, but was sent on to Toledo the next morning.

Observing the run from the freelance Aerocar—the only air-cooled engine in the run—no other stoppages for mechanical reasons were observed, and, indeed, the official schedule shows that none other took place.

The Royal Tourist, which Orrel A. Parker had entered and equipped with Newmastic instead of air-filled tires, suffered a delay through one of the new casings bursting. A competing car gave a shoe and inner tube which were mounted after the defective material had been cut off the rim. When a fresh start was made the Royal Tourist had dropped from the head to the tail of the line, but a wild dash got the party into Toledo on time.

At Norwalk, midway on the journey, Colonel Sprague held out the right hand of fellowship to the tourists, providing a wayside luncheon, appreciated by many who would otherwise have driven to the end of the stage without a thought of food.

#### THE SECOND DAY WAS MOST STRENUOUS.

Rain fell heavily while the Gliddenites slept at Toledo, and when a start was made on Thursday morning road conditions were the worst possible. There are 166 miles from Toledo to

WHEN THE TOURISTS ARRIVED AT TOLEDO FOR THE FIRST NIGHT'S REST.

South Bend which had to be covered in nine hours. The official confetti car took the brunt of the burden, for when Dai Lewis and his party set out on the Maxwell to blaze the way rain was still falling and roads were axle deep in mud.

Almost at the outset—less than ten miles from Toledo—Pierce, No. 2, driven by K. R. Otis, skidded and turned turtle when trying to pass Phil S. Flinn's Pierce, No. 14, on a narrow and treacherously slippery road. Mr. Otis, Mrs. Otis and Miss Rollins were pinned under the car, receiving painful injuries. Photographer F. E. Spooner and Chauffeur J. Newman were both thrown clear as the machine went over and were none the worse for the disaster. Phil S. Flinn held up the cars immediately following, hurrying the sufferers back to Toledo, where they were placed in a hospital. The ladies of his own party, unnerved by the accident, also abandoned the trip, Pierce No. 14 continuing the journey later without them.

A second accident of an equally serious nature befell T. J. Clark, driving Packard No. 6. Taking a sharp turn at high speed near Bryan, O., the machine rolled over twice, crushing T. J. Clark, who was at the wheel, breaking a rib and inflicting internal injuries. Despite the seriousness of the accident the machine was uninjured in its vital organs, and after the wounded man had been placed under medical care it was decided to continue the run, Dwight Huss taking charge of the car. Half of the steering wheel had been carried away in the fall, making the car exceptionally difficult to manage on the greasy roads. At Brimfield there is a stiff, short rise, followed by a sharp turn to a wooden bridge crossing the railroad. Although going at slow speed, it was impossible to control the Packard, which crashed into the right-hand side of the bridge, breaking down the wooden barrier and stopping with the front wheels suspended over a twenty-foot drop to the railroad below. The double mishap did not dishearten the Packard drivers, for the machine was hauled back onto the road, repaired, and once more started for South Bend. While our Aerocar was held up by the roadside for its fourth inner tube, the Packard rushed by with its two occupants, its broken steering wheel, and its damaged and

very badly scratched body. Every party had to report plenty of mishaps of a minor nature. Running over beds of dripping, oozy clay, on which even a score of cars had failed to find a ground surface, a sudden slewing round of the rear brought mishaps perilously near, and in several cases, as could be seen from tracks, cars had been ditched and hauled out again by other than internal combustion motors. At one wayside cottage, close to a sharp, narrow bend on the road, one good dame reported that three cars had gone into the ditch and that one party had been unceremoniously tossed onto her lawn.

Under the terrible strain of long grinding on the low gear, and of twisting and thumping at the transmission, mechanical weaknesses made themselves manifest. Axle-deep in a sea of mud, the Pungs-Finch was come upon with a cracked cylinder, its cooling water trickling out and losing itself on the besotten highway. A more disconsolate family

party than the two ladies, the young child and four men who cast successive glances at one another, the disabled machine, and the wild waste of mud, it would be impossible to discover. A touch of brightness was added to the scene as a motorcyclist came down the lane, riding with acrobatic agility on a narrow strip of grass or dismounting and pushing his two-wheeler when the border merged into the common basis of mud.

No. 52, Deere, a non-contestant, was passed by the wayside apparently carrying out repairs to front spring hangers. Meteor, No. 37, broke a steering knuckle, which was repaired by the roadside with parts being carried out for the Deere, which had suffered in a similar manner the previous day. Runabout Dragon, No. 113, stripped a gear outside Ligonier and was towed off the scene by a couple of horses. The Acme had serious trouble, incurring a penalty of 106 points. Orrel A. Parker's Royal Tourist was the victim of slight irregularities which made it impossible to adhere accurate to schedule. R. H. Lockwood's little Reo found itself at the end of the day with 22 points to its debit account, and its companion, No. 33, was also docked a point for passing over the line ahead of time. The pilot car had not arrived at headquarters, no flag was displayed, and the Reo driver was in doubt as to the

SOUTH BEND HEADQUARTERS, WHERE SECOND AND FOURTH DAY STOPS WERE MADE.

exact time. Under such conditions his penalization is more of an honor than a disgrace. N. H. Van Sicklen, a veteran of previous Glidden tours, had ill luck which caused him the loss of 23 points. The magneto contact broke away and, although the official score would only appear to indicate a minor trouble, the breakdown was so complete that Van Sicklen ceased to strive for the trophy.

In addition to the Dragon two other Hower trophy contestants suffered from the strenuous conditions, R. G. Kelsey and his Matheson with a loss of 56 points, and C. S. Johnston's Continental with a loss of 35.

### THIRD DAY WAS COMPARATIVELY EASY.

With a quarter of the road perfect and the remainder never descending below the moderate stage, excepting a miry mile near Croker and Chicago's unsavory entrance—most of the contestants traveled the hundred odd miles from South Bend to Chicago without penalizations.

N. H. Van Sicklen's Apperson made the journey, but ceased to compete for the trophy, the entrant announcing later that, as the result of magneto troubles, he would not go further than Chicago. No. 6 Packard also ceased to figure as a contestant, and Orrel A. Parker withdrew his Royal Tourist, after protesting that the tour had become a race. Columbia 56, entered by F. E. Dayton, failed to come through, and Charles A. Fleming's Maxwell had to be hauled to a blacksmith's shop with a broken rear axle. When the damage has been repaired the machine will continue as a non-contestant. About forty miles east of Hammond, Ind., A. L. Peterson's Meteor swerved out of the road in order to avoid hitting a buggy, jumped a ditch six feet wide and broke through a barbed-wire fence. A spring clip had to be replaced as the result of the leap, and the time lost in getting the car back to the road involved a penalty of 160 points.

American Mors No. 15, driven by G. Cabanne, skidded while traveling at a rapid clip. A front tire blowing out at the same moment, the machine rushed into a telegraph post, throwing all the occupants into a swamp. None were hurt, nor did the delay affect the clean score of the car.

All the runabouts competing for the Hower trophy finished the daily dash with perfect scores. J. C. Zimmerman's free-lance Locomobile arriving in Chicago just behind the official confetti car. W. A. Badger withdrew his Cleveland No. 115 with a clean score, stating that important business called for his presence at New York.

### FOURTH DAY RUN HAD A PACEMAKER.

SOUTH BEND, IND., July 15.—Those who protested that the A. A. A. tour was developing into a cross-country scramble had their justification to-day, when the committee in charge put into operation a scheme by which it was impossible for any competitor to lay up for himself by fast driving a reserve of minutes for possible emergencies. Chairman Hower, on official Pierce "99," set out half an hour ahead of the first car, maintaining an average speed which would bring him into control within the time limit and forbidding any competitor to pass the pacemaker. As the cars were sent away at one-minute intervals, each driver was given a card bearing a large printed number, corresponding to the position he occupied in the procession. Except when a stop was made for repairs, no car might pass another bearing a lower number. Competitors detained en route for any reason had the right of way, on holding up their card, over others with higher numbers, but only to gain their original position in the procession.

The plan worked satisfactorily, for no complaints were heard during the journey, and when criticism was invited at the close of the day none was forthcoming.

Although the Chicago-South Bend route had deteriorated considerably as the result of early-morning rains, 60 per cent. of it being poor to bad, there were few difficulties along the roadside.

H. C. Shoemaker removed his production from the active to the non-contesting list. R. L. Lockwood's No. 34 Reo found 212 points against it at the end of the day, and No. 35 Reo, up to this point a perfect scorer, turned its back on the tour at Chicago. George F. Barr's No. 46 Aerocar, mostly through repeated tire troubles, lost time to the value of 106 points, all other contestants for the Glidden trophy or clean-score certificates arriving according to schedule.

Among the Howerites, No. 106, R. G. Kelsey's Matheson, was the solitary derelict, all others arriving with the regularity of clockwork. About ten miles from South Bend the Matheson broke a connecting rod, was towed home by a White steamer, penalized the maximum number of points and abandoned the run.

Buffalo and Pittsburg automobile clubs still remain with perfect scores. New York, Cleveland, A. C. A. and Detroit had additions to their black list, while Chicago and Westchester clubs finished the day without any loss.

### FIFTH DAY'S RUN ENDS IN A WARM WELCOME.

INDIANAPOLIS, IND., July 16.—In the 147-mile run to-day from South Bend, three of the clear-score brigade lost their places in the honor roll of perfect performers. It was a hard day's run over roads that were both good and bad, about as much of one kind as the other. Mayor Bookwalter and "Tom" Taggart, who was the city's chief executive when the L. A. W. meet was held here eleven years ago, were in the party which escorted the early arrivals into the city. At a brief session to-night in the Hotel Denison, where the Automobile Club of Indiana has rooms and entertained the tourists, the Mayor in a short speech tendered the freedom of the city to the visitors. Deep sorrow was expressed when Mr. Glidden stated that word had come from Bryan, O., of the death of T. J. Clark, who was injured on the second day's run. A committee was appointed, with Mr. Glidden as chairman, to draw up resolutions of sympathy to be forwarded to the family of the deceased. To-night the contesting cars are parked in Soldiers' and Sailors' Monument circle and guarded by policemen. One car failed to start this morning—H. N. Coate's Auto-car No. 30, which began the run with a cracked frame, had further trouble and had not checked in when the score sheet was made up. George F. Barr's Aerocar No. 46, which was late to report on Monday, went out of the tour as a contestant, but after being repaired will continue as a free lance. A broken water pipe connection caused the loss of points. J. H. Becker's sealed bonnet Elmore to-day broke a hub, causing a delay of several hours, soiling the previous clean-score record, but not putting the car out of the run. A defective rear axle bearing was the cause of the abandonment of H. C. Stutz's Marion runabout No. 107, about forty miles from Indianapolis, and it was towed to this city.

About twenty miles from Indianapolis I. W. Kirkham's Maxwell was struck by James Barclay's Thomas non-contestant and one of the Maxwell's front springs was damaged. Chairman Hower gave permission to have the spring repaired under suspension to-night without loss of points and the car remains in the clean-score list. It made the control on time to-day by accomplishing a quick temporary repair.

When the caravan passed through Kokomo the tourists made brief stops at the Apperson and the Haynes factories, where the glad hand was extended in good style, cooling drinks being served ad lib. All along the route in this district there was an air of welcome, with flags waving and many spectators. At Kokomo the rival makers tried to outdo one another in being the first to relieve the tourists' throats of some of the parching dust, the Apperson brothers providing a liberal supply of lubricators, with white-jacketed waiters to hand them out, while the Haynes people sent their refreshments out in a number of testing cars, each arrival being held up, to his own surprise and relief. Wednesday the Stoddard-Dayton Company provided both liquid and solid refreshments to the hungry travelers when they arrived at Dayton, where similar pains had been taken to provide royal hospitality and an open welcome to the tired and dusty cavalcade.

SPECIMEN OF THE ROADS ENCOUNTERED BY "THE AUTOMOBILES" AEROCAR BETWEEN TOLEDO AND SOUTH BEND.

**Chicago's Entertaining.**—Chicago gave gracious welcome to the tourists and contestants. There was a steady procession of private cars running out to the suburbs, with their occupants waving greetings. At the head of Michigan Avenue a long file of Maxwell cars were drawn up, with military precision, each bearing a sign and its horn tooting continuously. The stores of the agents along Michigan Avenue were decorated, and the dealers shouted welcomes from the curb line. The Chicago Automobile Club, the Chicago Motor Club and the Chicago Automobile Trade Association had a printed programme for Friday, Saturday and Sunday ready, which was distributed to the occupants of each car as it arrived. The events of Friday were a concert by the Ellery band at the Coliseum and a reception at the new clubhouse of the Chicago Automobile Club. On Saturday there was the 24-hour race at Harlem, which began at 4:30 P. M. Friday, preceded by short contests. The tourists were not admitted free, as not a few had anticipated, when they reached the track. Sunday there was a run along the north shore of the lake to Ravinia Park, where a concert was given by the Damrosch orchestra. At 5 P. M. a military review followed at Fort Sheridan. As for informal entertainment, it was in progress all the time. Everybody was willing and anxious to buy liquid and solid refreshments, and the cafe at the Annex was kept in a busy state.

**Hotel Arrangements.**—The "Man from Cook's" was at times a bit hard to follow, and, of course, there was some kicking

about the hotel arrangements; but the fact is that the committee pretty well lived up to its agreement for impartial treatment of all. The instructions of the advance agent, who was a stranger to the tourists, were to even up the "room-and-bath" accommodations, so that on the whole trip every one would have this arrangement an equal number of times, the "room-and-bath" supply seldom being equal to the demand. A party that had poor accommodations at one place had good fare at the next, and vice versa.

One of the humorous phases of the hotel accommodation matter turned to light when the big hotels were reached. Those who went through Canada last summer and remembered Three Rivers as a sort of "some place east of Suez, where their best is like our worst," put in a sweeping request for the "best there is" throughout the trip. At Chicago one of these participants found his chauffeur and mechanic, as well as himself, assigned to rooms at \$8 a day, while Chairman Hower was passed out for his lonely occupation a corner suite of bedroom, parlor, dining-room and bath, with oil paintings on the walls, and a tariff of \$25 a day, European plan.

**Suggestions for the Next Tour.**—Said one who gives much thought to endurance touring: "Nearly every one has it all framed up how these events should be run in future. One thing seems certain, that we have more valuable experience in regard to what conditions are proper than ever before, and another year should see an excellent set of rules. The folly of penalizing the cars for arriving ahead of time, and the farcical harshness of making them and their occupants sit in the sun or rain, all dirt begrimed, for an hour or so before checking in never was brought into relief more ridiculously. This rule, originally designed to prevent racing, does nothing of the sort, and, therefore, is the persistence of a silly blunder. A premium is put upon 'beating it' by requiring that lost time be made up, and the only way to abolish it seems to be in the suggestion to borrow an idea from the rules framed by the Automobile Club of America for its Sealed Bonnet contest—have all the stops for tire troubles, repairs, refreshments, etc., added to the running time, so that a stop of an hour makes a car due one hour later. This, of course, would necessitate placing an observer on every car, but it would eliminate the racing, and a schedule could then be framed that would be sufficiently severe to make a contest."

**Now Inclined to Believe in Fate.**—Frank J. Fanning, sales manager of the Haynes Automobile Company, and Mrs. Fanning, believe somewhat in fate now. While traveling in the Haynes No. 92, entered by F. Ed Spooner, from Toledo to Bryan they had a narrow escape through a skid, which threw

CHAINS WERE NEEDED EVEN ON THE FRONT WHEELS.

the car off one side of the road. The wheels on one side dropped down into a pipe-line excavation, which was hidden in the tall grass. Mrs. Fanning flew out of her seat on soft turf and was uninjured. Mr. and Mrs. Fanning had come to Toledo in a Royal car from Elyria, driven by Robert Jardine, the Royal designer. The Haynes arrived late the morning of the start from Toledo, the delay having been due to a small repair. Mr. Fanning was anxious to go on, and there was one place with Mr. Otis; but both Mr. and Mrs. Fanning could not be taken care of. Mr. Fanning then said he would be all right in Packard No. 6. While waiting for this car the Haynes came along, with Edward Aker driving, and Mr. Fanning took it. The Packard car turned over with Mr. Clark driving, as did also the Pierce car, and Mrs. Fanning was thrown out of the Haynes car in the bargain.

**Sally Sandsak.**—A surprising amount of sport was had by Arthur Jervis and the other occupants of the only Berliet car, entered for the American Locomotive Automobile Company, out of the dummy figure of a woman that they carried in the tonneau. Originally the thing was a sack to be filled with sand as ballast, in lieu of a fourth passenger, and H. C. Townsend, the driver, had rigged it out as a lay figure for his own amusement. The live passenger was found at the last minute, and the bag stuffed with straw and tied so as to form a head, on which features were painted, and the whole surmounted with a woman's hat and veil, while the body wore a duster. The dummy was christened Sally Berliet Sandsak, and "Sally" made a hit with the bystanders in every town. In fact, her presence in the car won the other occupants much sympathy from the fair sex, who seemed to think that they had been so lonely for female society that they had rigged up "Sally" for company.

**The Solitary Air-Cooler of the Run.**—Air-cooled advocates failed to put in an appearance for the Glidden, the Hower, or the clean-score competition, a fact which called forth not a little comment from automobilists in general. The only air-cooler on the run was the freelance Aerocar No. 91, carrying THE AUTOMOBILE representatives. Without a falter from beginning to end, without even lifting the hood except to pour oil into the crankcase, the little waterless car has performed a task which some of the powerful water-cooled machines found beyond their strength. Except for a series of punctures on the second day, all the controls would have been made on time, though ever and anon the driver was held back while an interesting scene was snapped or information gathered on roadside phases of the run.

**Humorous in His Misfortunes.**—Car No. 36, a Pungs Finch, driven by E. B. Finch, was not heard from officially after the start from Toledo on Thursday morning. Saturday afternoon R. D. Chapin received two amusing postals from Mr. Finch, both sent from Swanton, Ohio. The first one had on it a picture of the victim of a lynching bee hanging from a tree limb, and the printed legend read: "I've got to hang around here awhile." Written by Mr. Finch across the face of the card was the message: "Awfully sorry I can't continue with you." The second postal was more explicit. The printed part was a picture of a man suspended by his trousers seat from a hook in front of a butcher store, and the words: "I stopped on my way down." On this Mr. Finch had written: "Cracked cylinder."

**Daily Newspapers Well Represented.**—The leading dailies which give particular attention to automobilism are all specially represented. New York papers have these well-known writers: Johnson, *Sun*; Curry, *American*; Jervis, *Mail*, until Wetmore joins at Pittsburg, when "Senator" Morgan will again continue the *Globe* story; Gerrie, *Herald*; Horner, *Press*; Harrison; *Tribune*; Field, *Brooklyn Eagle*. Boston has Kerrison, *American*; Sullivan, *Globe*; Reynolds, *Post*; Murphy, *Herald*. Chicago's

SOME PURE COUNTRY MILK WHILE THE TIRE IS REPAIRED.

men are Patterson, *Record-Herald*; Estey, *Inter-Ocean*; Clark, *Post*. Philadelphia has Gilchrist, *North American*; White, *Press*. Cleveland's pair are Lowrie, *Plain-Dealer*; Gilbert, *Leader*. Buffalo supplies Sullivan, *News*; Stevens, *Express*. Of course, the camera stars are along—Spooner, Lazarnick, Shapiro, Corneille and several others.

**Youngest Driver of the Tour.**—The youngest driver on the trip is little Albert Kumpf, who operates Pierce No. 27, the number always used by Percy Pierce. Young Mr. Kumpf is under 18 years of age. He has been a driver for a great many years, and is a careful and conscientious operator of a machine. "The Kid," as he is known by his fellows, was with Percy Pierce in the Herkomer contest, and has been out a lot in cars. It is said that he was originally office boy for the Geo. N. Pierce Company, and graduated to a position as stenographer, taking up driving through a liking for it. He holds his car well in hand at all times, does not drive at all recklessly, and arrives in ample time to score in every night. He has no ambition to be in hours ahead.

**Should the Racing Board Run the Tour.**—At Chicago one of the jesting contingent suggested that the balance of the tour be turned over to the Racing Board of the A. A. A. to conduct, there being two members of the Board in the caravan. In speaking thus the joker was unconsciously flitting about the flame of vital truth, which is that, inasmuch as the automobile is primarily a speed vehicle, it is anomalous to project any lengthy competition between motor cars in which the element of speed is not a factor. Excepting gymkhana events, an automobile contest in which racing does not enter is so absurd as to be almost unthinkable. For this reason the Racing Board is the proper body to control all competitions.

COL. SPRAGUE GREET'S "THE EDITOR" UNDER HIS BANNER

THE WHITE STEAMER THAT CARRIED DIAMOND TIRES.

**A Royal Try-Out.**—Twenty-five miles out of Toledo a slight trouble developed in F. E. Spooner's Haynes No. 92, which necessitated a slight delay, the car being a non-contestant. Robert Jardine, of the Royal Motor Car Co., came up in a Royal. Asked where he was going, he replied "Anywhere," and the party hopped in with a request that Mr. Jardine take them to Toledo. He did so at an average of thirty miles an hour, remained a few minutes, and made the run back to Cleveland in four hours, a trip of 244 miles, as a favor to friends. Mr. Jardine was merely trying out a car brought in by an amateur, who claimed it had no speed. Mr. Jardine found that it did.

**How One Farmer Made Money.**—Along the road nearing South Bend a farmer's boys aided him by filling a deep rut with great clods of hard dirt. Striking these the cars skidded easily into the ditch, when the farmer made a dollar pulling them out. The writer saw the clods while traveling along in a Thomas "60," sent out by the B. F. Goodrich Rubber Co., and just as the car reached the point the kids came out of hiding in the woods to see the fun. There was no fun, for William Turner, the driver, held the car well in and passed over the trouble easily. For doing so the kids reviled him, and the farmer had rather a sour expression when greeted cheerily.

**Ohio Due to Make Roads, Not Presidents.**—Here is a press agent's paragraph, given out at Toledo. "A character of the tour, who made a hit from the start, is Sally Sandsak, who sits very erect in the tonneau of the only Berliet entered and is affable to every one. According to Adell Starr, who rode with her the first day, Sally said of the roads: 'This beats the bumps at Coney Island. See this rich country, and these dirt-cheap roads! It does jar me! And I think the people of Ohio had better stop making Presidents and begin to make roads.'" Sally is wise in her generation.

"THE LIFE BOAT" THAT RENDERED ASSISTANCE EN ROUTE.

**It's Strenuous, All Right.**—It was amusing to the veterans of former Glidden going to hear the newcomers thresh over the old straw of the unmiscibility of the sweets of touring and the bitters of contesting. In announcing his withdrawal, one contestant filled up three type-written sheets with arguments to prove that the schedule required too strenuous a pace for pleasure. He had it all figured out to show that, deducting the mileage through towns at the legal pace, the cars must "beat it" all the time in the open country.

**Why He Didn't Drive in Chicago.**—The only Tom Fetch turned his Packard press car over to another driver some distance out of Chicago and entered the city on a railroad train. As they say at breakfast time, "There's a reason." Tom, who never could be accused of carelessness, had the misfortune to run down a man in the Windy City not long ago, and the police were looking for him. Tom was not conspicuous at any time during the stay in Chicago.

**Two Keen Observers.**—Benjamin Briscoe and John D. Maxwell have been more or less in evidence at several of the stops, and they have been keen observers of proceedings. They both like touring, but can't see the fun of a hundred miles or so a day over miscellaneous roads, averring that they do ride in their own cars frequently, like the Cleveland restaurant keeper, who advertises in this strain: "I eat in my own place."

**Few of the Fair Sex.**—Most of the men competing made up their minds before the start that the affair was not a joy ride, but a contest, and as such would be no place for women. Consequently, there were very few of the fair sex in the party, and those present probably came to the same conclusion previously reached by the men who left their wives at home.

**The Busy Publicity Men.**—It is an active and resourceful band of publicity men who accompany the tour. They include R. H. Johnson, White; George Davis, Thomas; A. N. Jervis, Berliet and Maxwell; A. B. Tucker, Peerless; G. W. Campbell, Aerocar; Robert Spangler, Welch, and others who do some publicity work incidentally.

**Roasting the Chairman.**—"Shall we roast Hower?" was the query put to themselves by a coterie of newspaper men at dinner one night. One replied: "Oh, don't shoot the Chairman; he's doing the best he can." This went with most of the scribes, but some captious pens love any sort of a mark.

**A Pessimistic Reflection.**—One of the pessimistic reflections offered at Chicago was: "We have finished three running days out of fifteen, or one-fifth of the task. If the remainder of the tour develops five times the eliminations, penalizations and casualties of the first three days, what will be left of it?"

**The Only Woman Driver.**—One who is enduring the inconveniences and hardships of the trip not only with fortitude, but with patient amiability, is Mrs. Andrew Cuneo, the only woman driver. She tools her Rainier through the mud and dust and comes in smiling, with a pleasant word for all.

**A Heavyweight Quintette.**—W. M. Lewis, entrant of the Mitchell No. 24, is carrying a load of five, all of them heavyweights, and yet this is one of the few cars that had absolutely no difficulties in the first three days. Sales Manager J. W. Gilson is one of the happy tonneau passengers.

**Likes the Going.**—Sales Manager A. D. McLachlan, who rides in Royal Tourist 42, along with Messrs. Jardine and Cromwell, is one who makes light of the rough going. He says that he is riding "as comfortably as in a Morris chair on a veranda at the seashore."

**Star Sleuth of A. L. A. M.**—James Carples, the star sleuth of the A. L. A. M., was floating about the Auditorium Annex Saturday and Sunday, disguised as a smooth-faced man. There was no use asking his mission there.

# Aftermath of the French Grand Prix

WHEN NAZZARO MADE HIS TRIUMPHAL DASH PAST THE GRANDSTAND.

CHAIRMAN RENE DE KNYFF.

PARIS, July 3.  
—France has taken her defeat in the Grand Prix in a stoic manner, admitting with a frank-

mileage on a gallon of fuel than had been possible during the previous days. Had the bad weather continued, possibly Nazzaro would not have completed the distance on his fuel allowance.

General satisfaction is expressed on the working of the new fuel consumption regulations. The amount of gasoline allowed is the average amount used by the winning machine in the first Grand Prix and the Gordon Bennett race, with 1,000 kilos weight

ness that is rather surprising that a firm which can triumph over the world's best in three such widely differing contests as the Targa Florio, the German Emperor's Cup and the Grand Prix must indeed be the best. The Targa Florio was run on maximum bore, the German Emperor's race on maximum cylinder capacity, and the Grand Prix had minimum fuel consumption as its basis, each event calling for a different type of motor, and in each case Fiat produced the winner.

A minor satisfaction is drawn from the race by the French from the fact that all positions from second to ninth, inclusive, are held by native machines, Germany only placing one car, and that in tenth position. Altogether, but four foreign machines out of the sixteen officially finishing the race were built out of France, and this is considered as some consolation.

The mistake appears to have been made by French drivers of being too economical of their fuel. Lancia was unable to finish for lack of gasoline; Nazzaro had but 2.4 gallons when he reached the winning point. Most of the French tanks on the other hand contained a plentiful supply of fuel, Rigal (Darracq) having 9.3 gallons, for which he gains the gold medal, Barillier (Brasier) 9.2 gallons, Baras (Brasier) 8.5 gallons, Caillois (Darracq) 7.9 gallons, Szisz (Renault) 6.8 gallons. A week before the race weather conditions had been unfavorable, rain and strong winds considerably augmenting the fuel consumption. But a few hours before the race the weather changed completely, allowing the cars to cover a much greater

SZISZ IN FULL CRY THROUGH BELLEMEVILLE.

limit. Generally the machines are heavier than previously, but they are at least 10 per cent. faster than those of preceding years and are more economical in their consumption of gasoline. This year's course is no faster than the Sarthe circuit of last year, and is certainly several degrees slower than the Ardennes circuit, yet the machines have attained and maintained a speed unknown in any previous contest.

Brasier was the only manufacturer to complete the race with a

WHERE THE RACING GIANTS REPLENISHED THEIR SUPPLIES IN THE SEMI-CIRCLE OF SPECIAL DEPOTS BACK OF THE GRANDSTAND.

FITZ SHEPARD ON THE CLEMENT PASSING THROUGH ERE.

full team, his car being placed third, seventh and twelfth. Renault, though winning second place, but seven minutes behind Nazzaro, had a series of misfortunes. The day before the race Edmond became ill and had to be replaced by Henri Farman, who had never been round the course on a racer and who had not previously driven the machine. Richez, on the difficult Londinieres corner, overturned his machine, starting again with the loss of a complete round. The Bayard-Clement team of three was robbed of one unit by the breaking of a dismountable rim on Alezy's machine, his companions, Garcel and Fitz Shepherd, finishing in eighth and ninth positions. Shepherd bought the racer but a few weeks before the contest and although having had little training made the best score in his racing career.

To the surprise of all, not one of the new Panhard machines specially built for the race and tested out for months previous finished within the time limits imposed. Mercedes was only slightly more fortunate, Hemery, who is now an international free lance, placing the only car for the German firm.

**SMALL INTEREST SHOWN IN SPORTING CUP.**

PARIS, July 3.—In the excitement of the Grand Prix very little attention was paid to the seven machines rushing round the course at the same time in an independent struggle for the Sporting Commission Cup, the regulations for which were identical with those of the greater event, except that the gasoline allowance was reduced by half. De Langhe, previously unknown in the racing world, from the outset secured the lead with his Darracq and retained it, with the exception of the fourth round, when Demogeot, also on a Darracq, led for a few minutes. Final position for the six rounds (287 miles) was as follows:

**SIXTH ROUND.**

	H.	M.	S.
Darracq, De Langhe.....	25	45	29
La Bulre, Mottard.....	26	13	13

# The Scottish Reliability Trials

By Joseph A. Mack, Jr.

CARS RESTING AT THE PASS OF GLENCOE CONTROL.

GLASGOW, July 6.—As a searching test of reliability, last week's trial of the Scottish Automobile Club stands out as the most severe on record and will go down in history as unique in automobile annals. In five days the hundred cars have traversed well nigh 800 miles of the most mountainous country of Scotland, and with weather conditions persistently adverse, yet out of this ordeal all have emerged with triumph, and of the ninety-eight starters from Glasgow on Tuesday morning every single car finished on Saturday evening—the withdrawals continuing their journey unofficially and turning in at the close of the proceedings. As a triumph of organization, too, the trial has gained fame. With genial and untiring Secretary Smith at the head of operations, the Scottish A. C. has covered every detail relating to the conduct of the trial and the well-being of participants, every contingency being foreseen with a skill born of long previous experience.

The best tribute of this trial's success is the unanimous support of the trade. Entries totaled 107, and this number, as high as is consistent with efficient management, speaks well for the popularity of an event which has not the international glamor of a Herkomer tour. This number of cars of all powers and sizes was marshaled into seven divisions based on chassis price. Ten were numbered in Class I, listed at less than \$1,000, and here the 9-10 Cadillac and 15 Ford upheld America's reputation. This Ford did creditably under circumstances unusually severe. By the rule stipulating four passengers for every car of greater horsepower than 12, this two-seated runabout had to be fixed up with a special body, and throughout the run conveyed its overload of two extra twelve-stone passengers and their luggage.

In the under \$1,500 section were the Buick, which Huszar came across the Atlantic especially to drive, the 18 Reo and the 16 Maxwell, but this latter failed to materialize, along with the 55-horsepower Benz and seven others. The remaining classes contained the 20-horsepower White in the under \$2,500, the six-cylinder Ford in the under \$3,000, and the big White among the score in Class VI., listed at under \$4,000. The marking system embraced every point interesting to the prospective buyer. Reliability was rated high in value with 750 marks total, while a further 50 marks were given for ease of starting, any delay in excess of the allowed two minutes each morning

causing loss in this section. The timed hill climbs gave 100 marks to the best average performance, with a percentage to the cars coming next in merit, and similar marking rewarded economy in gasoline consumption. Throughout the trial a continuous system of observation was imposed, which pre-

vented any possibility of replenishment or adjustment without marks being deducted.

The usual weighing-in preliminaries were proceeded with on Monday, and the following morning saw the long string of cars wending its way through Glasgow's busy streets. Each vehicle had its official observer on board, the duties of these honorary officials being many and varied. Times had to be booked at each section of the journey, weights of passengers and luggage checked, and at no time was the car to be left unless driver and mechanic obediently followed his lead. The string of cars had a fixed order of starting, varied on subsequent days, and this method prevented the usual scramble for first places which spoils so many of these contests. A fixed minimum and maximum time was made for each section of road, and this likewise deterred the speed proclivities of the faster drivers.

From Glasgow the first day's 170-mile run led past the pleasant country round Loch Lomond to the more mountainous Glencoe, whence the route rounded on itself and went eastward across the South Highlands to Perth. The rough roads that had been selected soon caused trouble. On the big Ford the radiator drain tap worked loose and some delay was occasioned while fresh water supplies were obtained. The 30-40 Maudslay experienced still harder luck. Round a sharp curve the driver steered over the edge of the grass bank and a concealed stone bent the steering connecting rod. Repairs occupied longer time than the maximum allowance for the section, and though this did not involve disqualification other than loss of marks, the car was withdrawn from the run. Together with its companions in misfortune on subsequent days, the Maudslay was driven unofficially over the rest of the course and finished up to time at the week end.

Forty miles out halt was made while the cars were sent up the timed hill climb at one-minute intervals. This ascent of "Res and Be Thankful," the first of the four big climbs included in the contest, was a severe test both on account of the grade and the winding na-

ONE OF THE FIRST ARRIVALS AT INVERNESS.

ON THE CREST OF REST-AND-BE-THANKFUL HILL.

ture of the course. The mile climb, with grades from 1 in 12 to 1 in 7, gave no room for passing, and at the hairpin bend at the summit many of the long wheelbase cars found it necessary to reverse to take the curve. Several inexplicable stoppages which occurred on this climb were afterwards found due to failure of the gasoline supply, and indeed one of the principal lessons drawn from this event has been the liability of trouble through obstructed pipes and faulty arrangement of gravity feed tanks. The results of this climb proved a big victory for Ariels in the three top classes, the Mass, Germain, Calthorpe and Swift taking top positions in Classes IV. to I. The Whites both made good times, though the smaller car was handicapped throughout the tour by the inexperience of its amateur owner, who took the wheel. The 18-horsepower Reo made a good performance, but was balked on the final turn by the St. Vincent car, which it actually bumped before the driver could stop. A second attempt was made, but this did not bring the desired good results. Similar misfortune befell the 40-horsepower Ford. Of the ninety-eight starters a total of fifty-six made complete non-stop runs for this first day and six others experienced but short delay for tires, which was not penalized till the total reached over one hour.

The second day's run to Aberdeen was likewise marred by incessant rain. The continually winding route past Blairgowrie, with its famous beech hedge, led to the famous Devil's Elbow climb up the Spittal of Glenshee, the highest road in the Kingdom. Fortunately for many, this climb was not timed and consequently the frequent halts while the smaller fry were pushed round the worst corners were accepted with complacency. Just at the top of this climb the smaller White had some difficulty with a leaking safety valve and this failure caused its retirement

THROUGH BALLOCK BY THE SHORE OF LOCH LOMOND.

on the following day. The afternoon's run past Balmoral and Stonehaven was entered on in fear by the majority of the competitors, for the famous Cairn O'Mount climb lay before them. With its 20 per cent. pitches this ascent were bad enough at any time, but when the weather has conspired to make the surface inches deep in clay mud, failure need disgrace no car. The story of troubles here would be far too long to recount—even big six-cylinder cars needed an occasional helping hand. The Horbick burnt out its clutch leather in a vain attempt to restart, and similar efforts caused withdrawal of the 40-horsepower Junior and 30-horsepower Mass. The 18-horsepower Reo had its only trouble in the whole of the tour when it shed a passenger for a few yards, and the same may be said of the Cadillac, which here experienced its first delay in any Scottish trial—a total of one minute's stop in three annual events. The 15-horsepower Ford shed but two passengers, and with its normal load easily did the two-mile climb, and likewise the Buick made a very creditable showing.

Thursday's long journey from Aberdeen to Inverness by a circuitous route was favored with better weather, but this small mercy and the absence of a timed ascent were more than compensated for by the mountainous country encountered. The stiff climb up the Bridge of Avon and the consequent descent were noted as the most dangerous part of the tour.

The afternoon's climb up Trinafour Hill was run under a cloudless sky, and with the surface in ideal condition. In Class I. the 15-horsepower Ford did well and easily gained top position, while in the next section the Buick and Reo were respectively placed sixth and eighth. The Mass and the three Ariels took top places in the last four classes, as usual, and the hill climbing prowess of this quartet excited universal admiration. A short but pleasant run led to the resting place at Pitlochry, uneventful but for the differential trouble of the 60-horsepower Belsize, which robbed its driver of the coveted distinction of complete non-stop for the three annual trials. Last day of all, back to smoky Glasgow once again, brought about the resumption of the normal inclement weather conditions. At Aberfeldy came the three-mile climb up Loch Na Craig Hill, with a total rise of over 1,100 feet. The Ford was again well up in Class I. with second award and the Buick and Reo retained their places in the next division. Third section brought out victory for the only lady in the trial and all rejoiced to see Mrs. Riley get top place for her 20-horsepower Belsize after a most persevering run, spoilt only by a single stop of one minute's duration. Mr. Coleman's White met trouble on the hill of such nature that it was fortunate that the day's run was the last of the trip. The feed pump eccentric broke when nearing the summit and a hand-operated arrangement had to be hastily rigged up. For the remaining hundred miles the driver and mechanic heroically pumped with all their might and eventually finished in time after a most arduous day's work.

Back in Glasgow the fuel remaining in the tanks was carefully measured and the cars were then dismissed from their official surveillance. The preliminary non-stop records show surprisingly low numbers, the second day's climb spelling disaster to many who would otherwise have finished without trouble. In the first class no car was able to go through without stop, but both the Cadillac and Jackson cars had only one minute's delay against them. It is greatly to the credit of these smaller cars, however, to note that Class I. was the only section in which every car officially concluded the trial. In Class II. the 12-14 Argyll had a complete non-stop, the Reo coming next with but one minute's delay, together with the 10-12 Darracq. The Buick would similarly have had four non-stops to its credit had not, within the last fifty miles of the trip, a broken spark plug caused further penalization. Class III. had another Argyll as the only successful competitor, but in the next section the Humber, Sunbeam and Austin shared the distinction. The Austin, Straker-Squire and Vinot in Class V., the Berliet and Maudslay in Class VI., and the six-cylinder Hotchkiss in the highest powered division, completed the small list of but eleven cars which came through without stoppage. Seven other cars had but short tire delays.

# SOME FACTS PERTAINING TO ELECTRICAL IGNITION\*

By HENRY G. CHATAIN, MEMBER SOCIETY AUTOMOBILE ENGINEERS

THE following tests were conducted for the purpose of determining the most favorable operating conditions of a Simms-Bosch low-tension magneto. The magneto is of the inductor type, having a permanent magnet, bipolar field, stationary armature, wound on an I-section core and two revolving inductors, each extending over a quarter of the periphery of the armature. The field pole tips embrace a similar area. The magnetic conditions are shown diagrammatically in Fig. 1, whence it will be seen that

shown both current and potential waves taken simultaneously with magneto running at 600 r. p. m.

The magneto was now run with the make-and-break ignitor in circuit and a curve sheet, Fig. 7, was plotted connecting the position of inductor at time of break with amperes registered on an A. C. motor. The lowest point of the wave was reached when the break occurred, while the axis of the inductors was vertical, i.e. the inductors were just covering the portion of the armature

FIG. 1.—Magnetic conditions during half a revolution

FIG. 9.—Illustrating positions at which oscillograms were taken.

there are four maximum and four minimum points of flux through the armature per revolution, giving the magneto a periodicity of two cycles per revolution.

TESTS: The magneto was direct coupled to a D. C. motor, on the shaft of which was mounted a cam which actuated a variable make-and-break ignitor. It should be noted that the cam had two high points utilizing only two (maxima) peaks out of the four produced by the magneto. This was done to facilitate observations. A break of 5-32 inch was maintained throughout the test.

not enclosed by the poles of the field magnet. This point was taken as zero and the subsequent positions of the inductor at break were measured in electrical degrees from this zero.

Returning to Figs. 4 and 5, I would call attention to the shape of these two waves, the potential rising very rapidly and falling off quite as rapidly. The current rises as rapidly, but in contrast the wave does not fall off; this is a fine characteristic, as will readily be seen by inspecting the wave analyzed, as shown in Fig. 8—showing 80 degrees available for producing a spark of approximately the same current.

The resistance of the armature at 25° C. was 87.6 ohms.

The curves shown in Figs. 2 and 3 were plotted connecting volts and speed open circuit, and amperes and speed, short-circuited, the magneto running as a single alternator; note the almost constant current. At 340 r. p. m. the short-circuit current

The positions of the inductor at which the oscillograms were taken are shown in Fig. 9. To avoid confusion the use of the terms "advance" and "retard" with regard to the positions of the inductor has been avoided. Instead the relative positions have been designated "late" and "early," according as the break occurs

FIG. 2.—Curve illustrating short-circuit current, Bosch magneto.

FIG. 3.—Rise of potential on open circuit, Bosch magneto.

is .225 amps. and open circuit voltage 98, as read on Thomson A. C. instruments.

later or earlier than the inductor reaches the zero point.

Oscillograph records 4 and 5 were taken under the above conditions, showing the actual shapes of the potential and current waves; it will be noted that the potential wave is somewhat different from that usually shown, such as in Fig. 1. In Fig. 6 is

Fig. 10 shows current wave with make-and-break 60 electrical degrees late; note the small negative current to the left of each peak and below the horizontal line. This negative current is better shown in Fig. 11, which also shows potential wave taken simultaneously with the current. With 90 electrical degrees "late" we have a wave as shown in Fig. 12—the varying height of the wave peaks is due to poor contact of the ignitor.

\*Extract from paper read before the Society of Automobile Engineers at New York

FIGURES 17, 18 AND 19.

FIG. 17.—Kingston Coil. 4 volts on prim.; interrupt. per sec., 89; speed of film, 202 r.p.m.

FIG. 18.—"Apple" Coil. 6 volts on prim.; interrupt. per sec., 94; speed of film, 477 r.p.m.

FIG. 19.—Guenet Coil. 4 volts on prim.; interrupt. per sec., 111; speed of film, 435 r.p.m.

Fig. 13 shows potential and current waves taken 90 electrical degrees late, but at 600 r. p. m. of magneto.

A very interesting diagram is shown in Fig. 14, which shows potential and current 120 electrical degrees late. On the potential wave note rise of potential, then sudden fall; when contact is made then sudden rise again.

An analysis of the oscillograms, Fig. 15, shows the quantity of spark 60° late, which appears to be the best position, but all are so near alike that it may be assumed that anywhere between 60° late and 120° late a uniform spark may be attained.

**Tests of Some High-tension Coils.**

Passing from the low-tension magneto we will investigate a few of the properties of the high-tension coil with trembler. These tests were originally made with the object in view to determine what was the nature of a spark that attained the best results in the cylinder of a gas engine.

The writer has heard for a number of years the terms "hot spark," "fat spark," etc.; these terms undoubtedly convey an idea, but it would be difficult to design a coil from such data. In attempting to discover what a "fat" spark was, the writer has failed, but in the attempt has succeeded in getting some data relative to spark coils which may prove of interest, and may assist others in the discovery of the "fat" spark.

In the following table is given the Name of Coil and Fig. Number which corresponds to the oscillograph record:

Volts on primary, amperes primary, frequency of vibration of trembler per second, resistance of primary, resistance of secondary:

Fig.	Volts.	Amps.	Vibration		
			Prim. Per Sec.	Sec. of Res.	Res. Ohms.
Kingston	.....17			89	
Apple	5.20	2.2	94	.171	3715
Guenet	3.7	1.31	111	.390	2337
Gucnet	5.8	....	123	....	2337
Hardy	3.78	1.05	122	.274	2779
Fisher	5.8	.82	149	.613	2590
Dow	3.84	.57	149	.210	5394
Lacoste	3.72	1.46	177	.232	2006
Lacoste	5.62	1.94	197	.232	2006
Heinze	3.66	1.31	210	.320	1302
Pittsfield	....	....	228	....	....
Induction Coil Co.	3.62	1.55	360	.312	6180
Milwaukee	....	....	390	.312	6180

With a trembler vibrating at the rate of 100 per second and a motor turning 1,000 revolutions per minute, assuming that the

first spark occurred at the proper moment, the next spark would occur after the crank had traveled through approximately 61°. With the vibrations twice as rapid, 200 per second, which is more than the average, the crank would travel through 30°, and it is obvious that the second spark would be of little value in case the first did not ignite the gas. It would appear to the writer that the most desirable qualification of a high-tension coil is the regularity of action of the trembler, other conditions being equal, and that it is not necessary to obtain a very high frequency.

Probably the most interesting oscillogram of the high-tension series is the one shown in Fig. 30 with its calibration curve shown in Fig. 31. Here is shown the current waves of both primary and secondary, the upper the primary and the lower the secondary. Note the regularity of action of the trembler as shown by the primary current. In all of the oscillograms shown of the high-tension coils no attention should be given to their relative sizes, as the speed of film varies, likewise the perpendicular calibrations.

Before closing, the writer begs to acknowledge the kindness of Mr. John Taylor, the well-known telephone expert, for the use of his laboratory, and the assistance given by Mr. Richard Amber-ton in conducting tests.

EDITOR'S NOTE—Mr. Chatain's paper was profusely illustrated by lantern slides referring to tests of the Simms-Bosch magneto as well as of a large number of induction coils, but lack of space makes it impossible to reproduce more than a limited number of those used in the report of the Transactions of the Society of Automobile Engineers, from which the present extract is taken.

# NOTES FROM THE SHOP OF AN AMATEUR AUTOIST

By HOWARD GREENE.

MANY men are deterred from using automobiles solely by the fear that the cost of upkeep of a machine will be a constant and serious financial drain—that the first cost of the car will prove to be a comparatively small part of the whole cost of automobiling. It must be admitted that there is some foundation for apprehension; but whether this viewpoint is the correct one or not depends very largely upon the man who buys the car. If he desires to have all the work on his car, except the actual driving, done by others, who must be paid for their services, it will, of course, cost a good hard sum for the season. If, however, he is one of the many who have mechanical tastes, know a little about handling tools and are willing to take care of their own machines—who would rather do their own work than be without their cars—and are willing to take the trouble to become thoroughly acquainted with the details of their machines, he need not go very deeply into his pocket for his fun. A little ingenuity and skill, and a certain amount of willingness to work will take the place of a lot of cash. Moreover, a mechanically inclined man, who can use both hands and brains, can often get a second-hand car for a very reasonable price because of its poor condition, and then overhaul it himself, provided no very exten-

FIG. 1.—How the amateur repair was carried out on the universal.

sive renewals are necessary. Of course, there is a certain risk of accident accompanied by damages beyond the amateur's repairing facilities; but this risk may be very greatly reduced by careful driving. Ordinary small repairs and renewals can be made by the amateur workman at a cost much below the professional repairman's charges. The following examples serve to illustrate the idea and may be useful to someone.

The car in question is a shaft-driven machine. The universal joint at the rear of the gearcase consists of two forks, one on each of the adjoining shaft ends, set at right angles, with a cross-shaped steel casting or forging set between them in such a way that the ends of one of the cross-pieces fit between the jaws of one fork and the ends of the other cross-piece between the jaws of the other fork. The cross-piece ends are held in position, but allowed to swivel by trunnions with threaded parts that screw into the forks, as shown in Fig. 1. The arrangement is a familiar one to automobilists and will be recognized at once. The trunnions are prevented from unscrewing by sheet steel locks fitted over the screw-heads and secured to the forks by a small screw in each.

The trouble, in the first place, arose from the fact that these locks did not always lock. The little screw would work loose and fall out and the lock would follow immediately. Then the trunnion itself would gradually work out. The owner of the car caught trunnions working out three or four times, but while he was meditating upon an improved form of lock one of the trunnions broke off short and the joint let go, making a fierce banging and clattering, but fortunately doing no further damage.

Examination in the shop showed that all the screws were worn loose in their tapped holes, and that they should be replaced by larger ones, with larger trunnion ends to fill the worn holes in the cross-piece ends. But instead of rebuilding the joint in its original form the amateur adopted a plan that gave better results and that cost very little.

A rough forging for the cross-piece was purchased at a cost of seventy-five cents, under the name of an "offset," the two parts being offset from each other and at right angles. Instead of drilling a short distance into each end, a hole was drilled clear through each cross-piece, care being taken to have the holes at right angles, and the holes were reamed

FIG. 2.—The tool steel facing of the coupling.

to fit turned steel bolts. Each bolt passed through the fork ends and the cross-piece between, and its end was screwed into one of the arms, as shown, projecting far enough to take a lock-nut. The new joint has given no trouble and after a season's use is still in good shape, showing little wear and never having caused a minute's delay or anxiety. Moreover, it was silent, whereas the old joint rattled considerably, proving a constant source of annoyance.

Just behind the clutch on the same car is a coupling of a different form, consisting of two slotted members, which lock together as shown in Fig. 2. The abutting parts of this coupling gradually cut into each other until the coupling was loose and rattling. This was cured by chipping out the worn places and fitting in little plates of tool steel, which were riveted in place and filed off flush with the jaws, making the coupling as good as new—in fact, a little better, for the steel inserts were of harder stuff than the jaws and better adapted to resist wear.

The expense of having a set of new bronze bushings made for the gear case—the car was of an early pattern and new parts were not to be had ready made—was avoided by sawing through one side of each of the old bushings and putting a cap-screw through the casing so as to bear on the top of the bushing and close it up

FIG. 3.—An ingenious substitute for new bronze bushings.

when screwed down. In two cases the bushings were rather light and showed a tendency to dent under the pressure of the cap-screw. So the ingenious amateur chipped a recess in the casing to permit the insertion of a small plate of very stiff steel running the length of the bushing and distributing the pressure of the screw (see Fig. 3). While this may seem a very primitive arrangement—and theoretically it is about as crude as possible—still it has worked admirably in actual practice and has made it possible to keep the bearings of the gear-shafts tight and quiet, without any outlay to speak of; the very worst worn of the bushings is good for the rest of this season at the least.

Of course these particular ideas could not be carried out on every car, but doubtless there are some cars where they could be used, perhaps with some modification; and in any case they serve to show what can be done by the combined use of hands and brains. It may be well to call attention to the fact that these are actual repair jobs done by an amateur and that the car is at this moment in commission, so that these suggestions are entirely practical and well worth following.

### NOVEL DOUBLE-ACTING MOTOR.

It has often been wondered, particularly by the layman, why the internal combustion motor as applied to the automobile could not be greatly improved by making it double-acting, but to the engineer the difficulties involved have always been considered to be such as to make it not alone impracticable, but as being entirely out of the question in view of space and other limitations imposed by the car. An engine of this type has been built for motor-boat use, but so far as known nothing of the kind has previously been attempted in the shape of an automobile motor until the present, when the Fish Gas Engine Company, of Denver, Col., have devoted themselves to the matter and will shortly place on the market an engine of this type made under their own patents. They are not in a position to publish drawings or illustrations of their new motor at this moment, but the following description of its characteristics and the numerous essential features in which it differs from the standard type will be found of considerable interest:

"This engine is an improvement over the ordinary engine in the following respects," says its inventor: "It has an impulse of the piston at the beginning of every stroke in each direction, giving an action exactly analogous with a steam engine and can be built in single or compound cylinders. The compression spaces of the ordinary engines are removed from the cylinders and fed by a compressor into which the new charge is always taken and from which it is being continually forced into the auxiliary chambers, commonly called compression spaces, which are located in the cylinder head of each end of the cylinder, from which spaces it is admitted to the power cylinder, at the beginning of each stroke, in either direction, through mechanically operated ports of the proper dimensions. These auxiliary chambers are so constructed as to permit the volume being increased or decreased at the will of the operator. It will readily be seen that there being a fixed volume of intake at all times into the compressor, if this volume be forced into a chamber containing say fifteen per cent. of the original volume, the compression will be much higher and a denser gas produced than if this same volume be forced into a chamber containing twenty per cent. of the original.

"The engine is so constructed as to permit the operator to change the compression from half an atmosphere up to any desired compression permissible by the safety valve, or *vice versa*, while the machine is in full operation, this only requiring the mere turning of a three-way air valve. These auxiliary chambers are so arranged that the speed of the engine is increased until four or more full strokes of the power piston may be made while the waiting charge is expanding; that is, if the fuel requires such time for complete combustion. We have found that in moving the piston in the beginning of each stroke, to deliver a given horsepower, we need about one-twelfth the com-

pression required in an ordinary four-cycle engine, and we have also found that to give the gases their proper time for combustion there is absolutely no odor and but little sound coming from the engine, which is not even tapped for an exhaust pipe, to say nothing of a muffler; this being the case, the most inexperienced operator can tell instantly when the timer is delivering the spark at the proper moment to obtain the maximum power from the exploding gas.

"From the carbureter the gas enters the compressor which carries practically the same temperature all the time; here the compression begins and with it the temperature of the gases begins to rise and continues through its entire usage, unless it be when the engine is stopped; even then the stored charge will fire at an indefinitely later period—an experiment showed that we could hold this four days and nights and start the engine on the spark. Under the proper timing of the machine the charge will reach the maximum expansion in about seven-eighths of the piston stroke and deliver the exhaust at practically atmospheric pressure.

"The card taken from operating under these conditions is exactly the reverse of the card taken from a four or two-cycle type of engine; the reason for this almost unbelievable fact is that in the before-mentioned types of engines the gases are ignited while in direct contact with a moving piston, while in this they are only in contact with the piston at the proper point.

"This engine differs from others chiefly in that it is odorless and noiseless, having nineteen points of friction against sixty-five of the ordinary automobile engine of forty horsepower, and kerosene, gasoline, alcohol, distillate, naphtha or crude oil may be used. The engine also requires no change-speed gears, operating almost identically with the steam engine, is reversible and can be operated by an inexperienced person."

This new engine differs so radically from familiar standards that doubtless the majority of autoists will be like the Missourian and want "to be shown" just how it works.

### BRISK DEMAND FOR AMERICAN AUTOMOBILES.

In referring to the fact that a considerable number of English inquiries have been received at the Bristol Consulate from American manufacturers regarding motor machines, Consul Lorin A. Lathrop says:

Some American cars have been sold in Bristol and have given satisfaction. Competition increases by leaps and bounds, and I think it quite useless to approach the English market in other than a systematic and determined way. By this I mean a central depot in one of the great centers—London being pre-eminently the place—advertising, travelers, and the systematic establishment of agencies by demonstrators who come along with the car. The industry is developing rapidly in England. It is estimated that \$60,000,000 at least are invested in it, and all the first-class manufacturers are producing at their utmost capacity. It is estimated that some 20,000 motor vehicles of all grades and sizes were turned out in this country in 1906. Over 70,000 cars are now running, and the trade organs expect that this number will be quadrupled within ten years. Distances in Great Britain are so short and roads are so good that it is expected that all but the laboring classes will use motor cars within the lifetime of the present generation. Figures show that imported cars are not holding their own in the rapid increase, but there is a large and growing increase in the importation of "parts of cars." Manufacturers have not yet been able to catch up with the demand for the more expensive car, hence little attention has been given to the cheap, small, and handy vehicles. It is recognized that American manufacturers are ahead with the runabout. France, Belgium, and Italy are competitors with whom we have to reckon in England as well as with the domestic manufacturer.

American manufacturers have achieved great success in motor boats, and there is an excellent market for their product, but not in this consular district. Tidal changes in the Bristol channel are so great as to preclude the use of the small motor boat, and inland waters are shallow and weed infested. Public attention has been drawn to canals of late, and a royal commission has been appointed for examination into the conditions of their maintenance. It is generally believed that inland artificial waterways will be restored and more largely utilized in future. If this well-founded anticipation is realized, the motor boat, both for business and pleasure purposes, will find a considerable market in Bristol.

## LETTERS INTERESTING AND INSTRUCTIVE

### Will a Four-cylinder Motor Run with No Flywheel?

Editor THE AUTOMOBILE:

[819.]—Some time ago I had an argument with a brother autolst as to the capabllity of the average four-cylinder motor to run without its flywheel. He contends that it can, and I have taken the opposite stand. We are both quite positive that we are in the right, but though our contention is of somewhat long standing, neither of us has ever been able to substantiate his vlew beyond a doubt by actually making a test on an engine. As the opportunity to do so would appear to be rather remote at the present writing, it has occurred to me that probably you have seen the matter demonstrated or know of this havng been done at some time or other. If not, you can probably support my theoretical stand that the thing is not possible. If you think the matter is of sufficient general interest to your readers, will you kindly give it what attention you think fit?

A and B.

Tuxedo, New York.

Considered merely from the academic point of view, the question is one of more or less general interest, and as such may be answered in the affirmative unequivocally. There is no doubt that a four-cylinder motor of the four-cycle type can be made to turn over without its flywheel, and this would naturally be true to an even greater extent of the two-cycle owing to the greater number of impulses per revolution in the latter. But one case of a motor of the former type having done so ever came to our attention, and the circumstances were more or less similar to those which actuate you in making the inquiry—that is, simply to see if it was possible, as but a moment's consideration is necessary to show that it is not practical. The experiment was tried merely from the promptings of curiosity, which were satisfied by the result, which was in the affirmative. The motor did turn over, but its motion was the jerkiest that could possibly be imagined; it all but came to a dead stop between impulses and then the effect of the explosion was more like that of a projectile leaving a gun than anything else. As each charge was fired there would be an exceedingly quick, sharp stroke, barely sufficing to carry the piston in the next cylinder to fire to the proper point, when it would be repeated, the action of the motor resembling a series of hard blows. Failure to ignite a single charge naturally brought it to a dead standstill, usually about at the end of the compression stroke, so that it was easy to restart it merely by switching on the current. The experiments merely showed that it was possible for a motor of this type to turn over minus its flywheel, but had no other value.

### Regarding the Legal Requirements of Several States.

Editor THE AUTOMOBILE:

[820.]—Will you please advise me as to State License Regulations in the States of New York, Connecticut, Massachusetts, Vermont, New Hampshire, Maine, Rhode Island and New Jersey, and in which of these States it is necessary to take out license for passing through; also which of these States recognize a Pennsylvania license? Would also like to know the license requirements of Ontario, Canada.

I will appreciate all information you can give me on this subject.  
New Castle, Pa.

JOHN S. OURSLER.

All of the States you mention in your letter will recognize your Pennsylvania license, with the exception of New Jersey, so that it will be unnecessary for you to take out any additional license or register your car in any of these States except Jersey. In the case of Connecticut and Massachusetts, the exemption to non-residents only applies for a period of fifteen days, but as there is no one at the border to record your arrival and departure this section of the automobile legislation in question is of little or no force, so that such States are virtually upon the same basis as New York and others which recognize all foreign licenses indefinitely. In Ontario non-residents are not exempt and application must be made to the Provincial Secretary at Ottawa for registration, which costs \$4.00 for the first year. All of this information, and a great deal more, is presented in convenient tabular form in the Automobile Official Blue Book.

### Why Will Some Cars Not Throttle Down Satisfactorily?

Editor THE AUTOMOBILE:

[821.]—I have a four-cylinder gasoline car that is about three to four years old, and that has always given me satisfactory service, except in one particular, and that is the fact that I find it rather difficult to run it slowly on the direct drive. In other words, it will not throttle down satisfactorily, and before I learned its peculiarity in this respect I stalled the engine a good many times—on some occasions in more or less ticklish places, such as in the midst of traffic, when it is not alone awkward, but rather humiliating to have to get out and turn the crank while some irate truckman yells at you to "get a horse."

In order that you may have sufficient information on which to diagnose the case, I will give you a little history concerning the car. I bought it at second-hand two years ago, and its original owner had had it about the same length of time, and had always obtained good service from it, and, in fact, I can say the same of it, ever since it has been in my possession, with the exception just noted. When first turned out it was equipped with a rather complicated system of ignition—in fact, its first owner, who was an electrician, said it resembled a miniature central station more than anything else. There was a small direct-current dynamo placed on one side of the motor and driven at high speed, the latter being regulated by a governor. This dynamo was used to charge two sets of storage batteries, and current was taken from the latter for ignition and possibly also for side lights. On the dashboard there was an automatic switch which threw the dynamo from one set to another as soon as one was fully charged, and which cut both out when it slowed too much, in order to protect them, again closing the circuit automatically when the motor resumed. Probably it also had other functions, but this will be a sufficient description. This switch was enclosed in a brass case with a plate glass front, and is quite as ornamental as it is imposing looking, so that when the remainder of the outfit was removed from the car it was left in place—maybe to mystify the uninitiated. The original owner of the car had the system in question taken off, with the exception of the switch mentioned, and had the engine entirely overhauled and a low-tension magneto put on. This is the shape in which it was when it came into my possession.

I have learned the details of the car pretty thoroughly in other respects, but never have been able to fathom the cause of this refusal to throttle down properly on the high gear, which necessitates the use of the second speed to a great extent when driving in traffic. Can you help me out on this?

LOW TENSION.

Los Angeles, Cal.

Doubtless the fact that the magneto with which your car is equipped will not generate sufficient current to spark the motor when running at a low rate of speed accounts for your inability to throttle it down enough to run through traffic satisfactorily on the high gear. It is not so much a fault of the engine itself as it is of the ignition equipment with which it is fitted. The only remedy would naturally consist in the installation of a battery to take care of the ignition when the motor was running too slowly to make the magneto available, switching back and forth from one to the other as the circumstances required, but only using the battery to avert the necessity of having to resort to the second gear when compelled to drive slowly, as a battery will quickly be exhausted when used in connection with a make-and-break system of ignition. However, fresh dry cells will usually run an ignition system of this kind for from five to ten miles at a time without becoming entirely exhausted, and if only used when the occasion demanded would doubtless give considerable service owing to their great recuperative powers.

### What Causes This Hammering or Pounding?

Editor THE AUTOMOBILE:

[822.]—I have been troubled the past few days with a pounding in my engine, and have thus far been unable to discover the reason for same. My auto is a Model C Ford, 10-horsepower, 2-cylinder engine. When running on low gear or on the high gear on good, level roads the engine does not pound. But when I try to climb the least incline on high gear the engine pounds very badly, and also shows a great loss of power, making it necessary to use the low gear. When using the low gear the engine does not pound. The engine seems to pound the same with a small load as it does with a large load. This pounding has troubled me for some time.

and I have tried my best to locate same but so far have been unable to improve upon the action. I have given the oiling unusual care, have had a good mixture, kept the engine cool, have inspected the connections of the cranks to the piston and the shaft and find them all O. K. Have also used the spark advance very moderately, finding, however, that it pounds a great deal worse when advanced too far. Flywheel is tight, and all bearings in apparently good working order. From my opinion I think the trouble, that is the pounding, is in the connection either to the shaft or the piston, of the crank.

Any information that you can lend me through your paper that will assist me in freeing myself of this trouble will be greatly appreciated, and I wish to thank you in advance.

Tracy, Minn.

C. B. PATTRIDGE.

Judging from the description that you give of the pounding that takes place in your engine, we should say it was due to looseness in one or both ends of the connecting rod, i.e. where it is joined to either the crank pin or the piston pin. The fact that the motor only pounds when the load is applied is an almost certain indication of this, and that it does not pound so badly or at all when running on the level or with the low gear in only goes to show that it has not reached a stage where it is sufficiently acute to manifest itself under all conditions. Once under way when running on the level, or with the low gear in on the level, the stored energy of the flywheel practically supplies all the demands for power and the load does not come directly on the pistons; however, with the motor slowed down to take a grade the propulsion of the car devolves directly upon each power stroke of the motor, particularly in the case of single and twin-cylinder motors, in which the power impulses are separated by such wide intervals. Such a state of affairs is indicated by the fact that the car goes forward in jerks when hill-climbing instead of running smoothly without this perceptible effort. This causes a considerable shock to be exerted against the piston and its connections every time the direction of its travel is reversed, so that the slightest amount of play is evident in the shape of a knock. Excessive advance of the ignition also has the same effect for practically the same reason. Some engineers have attempted to differentiate between pounding and hammering, particularly steam users, and the example might well be followed in the case of the automobilist, as in many respects motors of the two classes are subject to the same ills. Hammering is thus employed only to refer to noises generated by mechanical troubles, such as a loose big end, loose piston pin, insecure flywheel and the like, while pounding is something that is the outgrowth of improper conditions in the cylinder, as in the case of the steam engine, where water is imprisoned in the cylinder due to the condensation of the charge left in it when stopped previously or the use of steam that is too wet. In the gasoline motor similar causes are found in running, with the ignition too far advanced, preignition and the like, and the difference would appear to be based on sound and logical reasoning.

#### Concerning the Route of Last Year's A. A. A. Tour.

Editor THE AUTOMOBILE:

[823.]—Will you kindly let me know through "Letters Interesting and Instructive" in your next issue the route of last year's Glidden tour, and also on what condition an American car can be taken into Canada for about two weeks.

SUBSCRIBER.

The route of last year's tour of the American Automobile Association for the Glidden Trophy was from Buffalo to Bretton Woods, New Hampshire, by way of Rochester, Utica, Saratoga, Elizabethtown, Rouses Point, Montreal, Quebec, Jackman and Rangeley, Maine. This, together with some additional information regarding the event was published in last week's issue of THE AUTOMOBILE, July 11. In order to take an American car into Canada it is necessary to give a bond for its withdrawal from the country at the end of the period named. We have no information at hand as to the exact amount of the bond required, but believe it is nominal and all the details can be arranged right at the frontier, either at Rouses Point or Niagara Falls, in a short time, there being no preliminaries necessary. It is also necessary to take out a local license and pay the usual registration fee, as the Canadian provinces do not exempt non-resident

autoists from the provisions of their automobile laws, regardless of the length of their stay. Like New Jersey and Pennsylvania, which have erected a wall against the autoist which he cannot pass without the proper credentials, a car cannot be driven in or into Canada without these formalities having been complied with. As application must be made to the Provincial Secretary at Ottawa, this should be done some time in advance to avoid delay.

#### Internal Combustion and Steam Motors Compared.

Editor THE AUTOMOBILE:

[824.]—I have had considerable experience with steam engines for some years past, but am more or less new to the gasoline and kerosene motor, and would like to ask a few questions regarding them on a matter that has puzzled me more or less ever since there has been so much published on the subject of the horsepower of automobile motors. For instance, take a stationary gasoline engine, such as we have here for power purposes. Its dimensions are given as 6-inch bore by 10-inch stroke, and it is rated at 7 horsepower at a speed of about 275 revolutions per minute. We also have a four-cylinder automobile here, the motor dimensions of which are given as bore 4.1-2 inches, stroke 4.3-4 inches, but it is rated at 35 horsepower, which would make the output of each of its cylinders almost 9 horsepower, or considerably in excess of the big 6 by 10 engine, though the latter has tremendous flywheels. To make another comparison, and this is the one that has puzzled me more than the foregoing, a friend of ours has a small steam launch with two cylinders, the dimensions of which, I think, are something like 4 by 6, and he says it develops 25 to 30 horsepower or more. I have no reason to doubt his word on the subject, and I know the launch to be very fast and powerful for its size, but I would like to see an explanation of the reason for the great difference in the power developed by these various engines. Any information you can give through your correspondence department will be appreciated.

A. W. B.

Dubuque, Ia.

Your questions involve the most rudimentary principles of motor design considered generally and regardless of the form of power used, electric excepted of course, and considerable misconception appears to prevail on the subject. To take up the matter of steam and internal combustion prime movers, constituting your last question, when it is borne in mind that the power developed by any type of pressure motor depends entirely on the mean effective pressure exerted on the head of the piston throughout the stroke times the number of strokes the motor makes in a given period, usually a minute, it will not be difficult to differentiate between them. This is the most important factor in any horsepower calculation and is usually referred to as the m. e. p.; it can only be calculated accurately by the use of indicator cards showing the maximum pressure attained in the cylinder and its expansion line down to the point of exhaust, as well as the condition of affairs during the exhaust stroke, as back pressure is sometimes present in the latter to offset the work accomplished on the power stroke. The exact area of these cards is determined with the aid of a planimeter, from which the average pressure on the piston throughout its working stroke is figured, this being the method employed of ascertaining this factor.

In the internal combustion motor this pressure is developed as the result of the explosion, aided by the initial compression given the charge of gas and air, whereas in the steam engine it is entirely a function of the boiler less any losses incurred in the transmission of the steam from the boiler to the engine. Thus the launch engine you cite is probably run at a boiler pressure of from 200 to 250 pounds to the square inch and is further a high-speed double-acting engine, receiving four power impulses for every revolution of the crankshaft, so that is in reality the equivalent of an eight-cylinder gasoline engine of practically the same dimensions. The same reasoning applies with equal force to your question concerning the large-cylinder stationary engine and the very much smaller automobile motor, which is nevertheless rated so much higher. As you say, the former travels at a very slow speed, not over 300 r. p. m.; its initial compression will probably not exceed 35 to 50 pounds per square inch at the most, while that of the automobile motor will doubtless be from 60 to 70 pounds and it will make 1,000 r. p. m., thus running more than three times faster. Its m. e. p. will not only be far greater,

but it is also exercised more than three times as often on the head of the piston of the one cylinder which you take to compare with the stationary motor. The flywheel has no direct bearing on the power developed, but influences the steadiness with which the motor runs. A single-cylinder motor naturally requires more weight and a wheel of greater diameter than a four-cylinder engine, due to the great disparity between the number of impulses generated by the two, and there is a far greater difference between the stationary and the automobile motor in this respect. Considerations of space, weight and, more than either of these, the effects of gyroscopic action, combine to limit the size of the flywheel of the automobile motor. There are not alone no such restrictions in the case of the stationary motor, but the latter is also designed to run at a uniform r. p. m. rate.

#### Correction Regarding Comparison of Steam and Gasoline.

Editor THE AUTOMOBILE:

[825.]—In your issue of July 4, in answer to "Puzzled," appears a statement which should be corrected. I had expected to see a correction in your next issue, but as it did not show up, and as the last ten years of fighting the battle of the combustion engine has given me the habit, I shall take the liberty of correcting the mistake, which consisted of the statement—A single-cylinder, double-acting steam engine is the equivalent of eight four-cycle gas engine cylinders, as far as the number of impulses is concerned. A moment's thought will show that this is not true. Whoever wrote the answer must have confused revolution and cycle.

One double-acting steam cylinder receives the same number of impulses as four four-cycle internal combustion cylinders or as two two-cycle cylinders. And one thing more that is not fair to the internal combustion engine in the same answer—the combustion engine does not receive a series of blows on the piston head—there is quite an appreciable interval of time necessary to burn the whole charge in the cylinder and during this interval the pressure is increasing.

K. G. JOHNSON.

New York City.

As you say, a moment's thought would suffice to show the error of the statement you call attention to, which represents an example of the class of errors that are inadvertently allowed to slip through despite the closest proof reading, and which are bound to occur in a newspaper from time to time. The comparison should naturally have read, either four-cylinder in the case of the gasoline engine, or two-cylinder in the case of the double-acting steam engine, in order to make it correct. However, there was no intention whatever to disparage either of these motive powers in favor of the other, in the latter part of the answer to which you call attention, this comparison being the illustration usually cited to show the relative difference in the action of motors of the two classes, and it must be admitted that the explosion of the internal combustion motor is more in the nature of a blow than is the admission into the cylinder of steam at even the highest pressures used in practice. We are glad to make the correction you refer to and are always pleased to have readers call attention to misstatements or omissions.

#### A Hardy Annual to the Fore Once More.

Editor THE AUTOMOBILE:

[826.]—I have an argument on with a friend of mine, and the stubbornness with which each maintains his position is doubtless in direct proportion to our mutual ignorance on the subject. I will designate myself as A and my antagonist as B, because I feel quite certain he is in the wrong and should be relegated to second place.

I maintain, first, that a 100 per cent. grade is an incline making an angle of 45 degrees with the horizontal or road line, and, secondly, that there is no authentic record of a car ever having climbed a 50 per cent. grade or better on an ordinary road or under ordinary conditions. I am quite aware that cars have climbed what amount to terrific grades in the shape of specially built wooden inclines and the like—circus stunts they may as well be called, for they do not show what the same car can do on the road.

B holds that a 100 per cent. grade means a perpendicular line and that other grades are in proportion. To make a sort of school-boy simile of it, a man hauling himself up a bar or climbing a rope hand over hand in ascending the equivalent of a 100 per cent. grade. He is also quite certain that 50 per cent. grades are not the extremely uncommon affairs that most engineers claim them to be and that many cars are able to go up them, if not "on the high," at least with credit to themselves and their builders.

As we have, metaphorically speaking, almost come to blows over this subject, a little light on it would be appreciated.

Kansas City, Mo.

A and B.

A is quite correct, a 100 per cent. grade is a 45 degree angle, grade percentages being measured by the number of feet of vertical rise, proportionate to the number of feet of horizontal travel. Fifty per cent. grades are very uncommon, indeed, if not impossible, except on mountain trails and specially prepared inclines, as you mention. We do not know of any car ever having overcome one except in the performance of what you have dubbed "circus stunts." We think B was fittingly put in second place, at least on the matter of grades—a constantly recurring subject of inquiry.

#### OWNERS' PROTECTIVE ASSOCIATION SUGGESTED

Editor THE AUTOMOBILE:

[827.]—As the result of my arrest at Amityville by no less than five husky deputy sheriffs recently, I wrote a letter of protest to the "Brooklyn Eagle" and to the "Brooklyn Daily Times." While driving along an open stretch of road we were apprehended by a guesswork calculation and on the merest technicality, and it took five officers of the law to see that we got our just deserts for this heinous crime. But it was not until we had run around a good part of the country that we could find a judge at Lindenhurst, who was probably on hand Sunday, as I believe he combines judicial functions with running an ice cream establishment. I was kindly warned that unless I was prepared to give bail I would be locked up, but it was suggested that \$20—it was called a fine—would save me considerable inconvenience, and I was admonished from the bench that I ought to be glad that it was not \$50. In interim we (my wife and myself) had been subjected to the indignity of being paraded through the county and compelled to wait for fifteen minutes in front of a low village grocery for the entertainment of the local hoodlums, almost like prisoners in stocks. All this for "covering one-sixteenth of a mile in ten seconds," or the equivalent of 22 miles an hour, which was the charge, though we were actually not exceeding 10 miles an hour.

My letter to the "Eagle" received the attention it merited, but I was surprised to note that a supposedly sane editor, in the case of the "Brooklyn Times," should be guilty of such intemperate language as to compare automobilists with the wild beasts of a cheap Coney Island show, "who must be kept in cages for the good of the community," to quote from the editorial in question. Probably this great editor (?) would evidently like to gather in the automobilists, and after their "being caged" as Bostock's lions, to which he makes reference, charge the public twenty-five cents a head for the privilege of gazing at those suffering from "Mania Automobiliana," this being the caption of his editorial, or, as he elsewhere terms them, "automobile mad gentlemen." Then he and the over-zealous deputies of Long Island might divide the spoils, including the fines, and find it more profitable.

The sheriffs of some counties of Long Island are very busy men these days, hiding behind trees and barns and lying in the tall grass, to see what will fall into their trap. This does not seem like a very dignified occupation for officers of the law toward citizens who are responsible and not in any way intentional lawbreakers. I think the time has come for the owners of automobiles to combine for their mutual protection, and would be pleased to cooperate in organizing an "Automobile Owners' Protective Association," as I believe in this way we will be able to accomplish by combined strength what it is now impossible to do as individuals, and eventually will be able to abolish a great many injustices.

Brooklyn, N. Y.

A SUBSCRIBER.

#### CORRECTION REGARDING A RECENT PATENT.

Editor THE AUTOMOBILE:

[828.]—I noticed in your issue of June 27, your article covering the patent recently granted me on a combined reverse and differential, and the purpose of which you describe as being the elimination of the reverse pinion from the change speed gear box.

While this application is of advantage, the chief purpose I had in mind in the designing of the invention was for use on different lines, and on which its advantages are more readily apparent. Many medium powered touring cars and runabouts having a shaft drive use the planetary form of change speed gearing, because it is cheap to make, very efficient on high gear, foolproof, and no clashing of gears in changing speeds, but with one or two exceptions they are all limited to two speeds and reverse. This invention of mine provides a simple reverse at the rear axle, and without any increase in size or parts allows the planetary form of change speed, as at present used, to be used, only changed to give three speeds forward instead of the usual two forward and reverse, thus making it equal to the three-speed and reverse sliding change speed gears, for convenience in driving, and retaining the planetary advantages.

WM. A. SALTER.

Cedar Point, Wis.

## VARIED HAPPENINGS AMONG THE AUTO CLUBS

### California Club's Annual Meet at Del Monte.

DEL MONTE, CAL., July 10.—The first run of the season of the Automobile Club of California consisted of a tour to Del Monte in order to attend the race meet held there on the Fourth. Eight hours were allowed to make the run from San Francisco, and, considering the hard nature of the going from Gilroy to this place, little or no time was given for unexpected repairs, but few of the cars experienced any trouble and all of their occupants reached the Vendome in good season.

The feature of the next day's racing was the event for the Del Monte Cup, which was again captured by Max Rosenfeld, of San Francisco, in a Peerless, it now becoming his property, as this is the third year in succession that he has won it. The final was between Minor's Locomobile and Rosenfeld's Peerless and the race was close for most of the distance, the Peerless getting ahead toward the finish and crossing the line a quarter of a mile in front of the Locomobile in 6:16 $\frac{3}{4}$ . The touring car event between Bert Dingley in a Pope-Hartford and a new Thomas 60-horsepower Speedway runabout promised to be of interest, but fell flat owing to a puncture in the gasoline tank of the latter, so that Dingley had no competition. It was the third event that roused the spectators, when the Stevens-Duryea Big Six, which had previously been in hard luck, did such fine work that neither the Packard nor Peerless could get near it, making the best time of the day in 6:06 $\frac{1}{2}$ .

The race for touring cars of 24-horsepower and over was won by Welch's Packard in 6:13 $\frac{1}{2}$ , while a novel event in the shape of a 100-yard dash for gasoline cars only went to Fleming's Pierce Arrow in 0:11 $\frac{3}{4}$ .

In the two-mile race for runabouts of 20-horsepower and under, the victory went to Tony Nichols' 12-horsepower Franklin, with the Moline second, Aerocar third and Locomobile fourth. Time, 3:14 $\frac{3}{4}$ . In the 20-horsepower and under touring class, Hendry's Moline won and the latter also carried off the mile speed-judging contest by coming closest to twenty miles an hour for the entire distance.

### Good Roads Convention in Springfield This Fall.

SPRINGFIELD, MASS., July 15.—The Automobile Club of Springfield has taken up the subject of good roads in earnest and in furtherance of it will hold a good roads convention here the last week in September. The feature of the convention will consist of the attendance of highway commissioners from New York, New Jersey and the New England States, while delegates from all the automobile clubs within that territory that are affiliated with the American Automobile Association will also attend. A sufficient number of the members of the State highway commissions have already signified their willingness to attend to insure the success of the project. The convention will last for two days and will consist of two business sessions, followed by a banquet. Papers will be read on road building and maintenance, as well as other kindred topics of interest.

### Minnesota State Association's Successful Run.

MINNEAPOLIS, July 15.—A two-day run of the Twin City members of the Minnesota State Association has proved to be one of the most successful and enjoyable affairs ever held under the auspices of the latter body. The run was to Mankato, Minn., which was made in a little less than five hours, Louis Piper and William Eastman in a Packard showing the way, while strung behind them were sixteen good-sized touring cars, George Daggett, chairman of the touring committee of the association, bringing up the tail end of the procession, together with a Red Cross car, which, however, was not needed.

### Gymkhana Sports of the Rochester Autoists.

ROCHESTER, N. Y., July 15.—The gymkhana sports of the Rochester Automobile Club, which were postponed two weeks ago, were held Saturday at Genesee Valley Park. The weather was ideal and over 6,000 spectators were present. Both sides of the course were lined with automobiles. J. J. Finucane in a Packard runabout car was the star of the day and captured the silver cup trophy in having the most number of points. Finucane won first place in the obstacle race for machines having wheel base of 100 inches or over. He also won the 100-yard dash 50 feet backward contest, the javelin hurling contest, the brake contest, and the flag race. In the last-named race there were three entries—A. M. Zimbrich, Owen DeWitt and J. J. Finucane. The cars were to run at not less than fifteen miles, stop, the operator to pick up a flag and then reverse to the starting point. Zimbrich's car in this event nearly got away from him in picking up the second flag and he recovered it just in time to graze the crowd of spectators. H. G. Strong and Owen DeWitt made a fine showing in tilting the rings. Both were tied for first place and in running off the tie it took two trials, as each captured the ring on the first attempt. DeWitt failed on the second and Strong became winner by annexing the ring this time also. The other events resulted as follows:

Obstacle Race, Class 1—Cars having wheelbase of 100" or over: J. J. Finucane, Packard, first, time 12 1-2 seconds; W. W. Powers, Packard, second; J. Seward Summers, Ford, 6-cylinder, third. Class 2—Wheelbase under 100": H. G. Strong, Franklin, first; time, 13 1-2 seconds; A. M. Zimbrich, Stoddard-Dayton, second.

Quarter-mile Time Contest—Contestant running closest to ten miles an hour, or 1 minute 30 seconds for the quarter mile, to win: E. Franklin Brewster, Stoddard-Dayton, first, time 1 min. 34 sec.; A. M. Zimbrich, Stoddard-Dayton, second, time 1:24.

One Hundred Yard Dash—Running left wheels on planking for distance of 25 yards: W. L. Smith, Pope-Hartford, first, 10 1-5 seconds; R. F. Ford, second; J. Foster Warner, Stevens-Duryea, third.

Dropping Potatoes in Basket—100 yards, flying start: E. Franklin Brewster, first, two potatoes in basket in 14 1-2 seconds' time; J. W. Cook, Franklin, second; J. Foster Warner, third.

Brake Test—Cars to speed for 100 yards and stop at line: First, J. J. Finucane, stopped on line, time 9 seconds; second, E. F. Brewster, stopped on line, time 15 1-2 seconds; third, J. W. Cook, Franklin.

Balancing Contest—Cars to carry pail filled with 30 pounds water up and down teeter board. J. H. Schocnhelt, Buick, first, spilled 3 1-4 pounds; A. M. Zimbrich, second, 4 pounds; H. R. Gragg, Premier, third.

### Worcester Club Undertakes Task of Road Marking.

WORCESTER, MASS., July 15.—President John P. Coghlin, of the Worcester Automobile Club, has just received a supply of the white enamel signs approved by the Massachusetts Automobile Association last spring and will shortly begin the work of posting the central Massachusetts highways. They measure 12 by 24 inches and carry blue letters and figures on a white ground, bearing the name of the Massachusetts Association and the monogram of the American Automobile Association, in addition to the warning conveyed. They will be posted near sharp curves and bad places in the highway, and the location of each sign will be reported to the State Highway Commission for approval, which, if granted, will make it permanent. Otherwise it will be removed. A second lot of signs of the same character, bearing under the seal of the A. A. A. the information "Endorsed by the Massachusetts State A. A.," are intended to be attached to already existing signs. President Coghlin will pay attention to the main route from Boston to New York in his territory at first, supplementing the work already done by the A. C. A. The portion of Massachusetts lying east of Framingham will be posted by President Lewis R. Speare, of the Bay State Automobile Association of Boston, while that part lying

west of Palmer will be taken in hand by ex-Président S. L. Haynes, of the Springfield Automobile Club, these gentlemen forming the signs committee of the Massachusetts Association.

Worcester police started taking time of autoists on city streets Saturday. One course is on Main street north from the Hotel Standish, on the main through route between New York and Boston. The other is on the route from Worcester to Lowell, Nashua and eastern points, just north of Lincoln Square. Notices of these traps were immediately sent to other automobile clubs and the State Association.

President John P. Coghlin, of Worcester Club, and John S. Harrington have established their summer home at Watch Hill, R. I., and drive there, 108 miles, Saturdays, and return Monday mornings.

Harry F. Estey, for two years a member of Worcester Automobile Club, and during that time a partner of Thorvald Hanson in the Palace Auto Station, 32 Hermon street, died Saturday night of Bright's disease, aged forty-one years. He was a native of Lancaster, Mass., and before going into the automobile business was connected with Kinnicutt & DeWitt, bankers.

#### Youngstown Autoists Organize a Club.

YOUNGSTOWN, O., July 15.—With the election of a board of trustees at a meeting recently held at the Youngstown Club by a number of enthusiastic autoists of this city, the Youngstown Automobile Club came into existence. The trustees are James A. Campbell, C. A. Cochran, J. R. Squires, Dr. C. R. Clark, Dr. W. H. Bilchner, D. B. Klingensmith and George Day. A constitution and by-laws for the newly formed organization were adopted at the same meeting and the board of trustees will meet within a short time to elect the officers.

#### Holyoke to Have an Automobile Club.

HOLYOKE, MASS., July 15.—Holyoke has long wanted an automobile club and now the desire of enthusiastic followers of the car in this district are to have their wishes gratified. At the organization meeting which took place at the Hotel Hamlin the Massachusetts State Automobile Association was represented by Secretary James Fortescue, while a number of prominent members of the association were present, as well as a delegation from the Springfield Automobile Club. The new club has a membership of about 100.

#### CLUB DOINGS IN GENERAL.

PUEBLO, COLO., July 11.—The Arkansas Valley Automobile Club has been organized and incorporated here with the following named as incorporators: F. A. Kettler, W. L. Hartman and H. E. Brayton.

AKRON, O.—At a meeting of the Akron Automobile Club, held last Friday, a committee was appointed to confer with the city authorities to secure the enactment of a more liberal ordinance, one embodying general regulations without reference to speed alone.

ST. LOUIS.—The Automobile Club of St. Louis will place signs on the country roads hereabouts every mile, bearing hieroglyphics designating the distance to the nearest town, kind of road, and whether it is best to drive fast or slow. Other counties are arranging to adopt the plan. A printed key to interpret the signs will be furnished automobilists desiring same.

NEW YORK.—The City and Country Motor Club of New York has just added new suburban clubrooms to its facilities, the latest addition consisting of a suite of rooms at the Terre Marine Inn, Staten Island, facing the bay. The club has now three out-of-town assembly places, in addition to its headquarters at 309 West 109th street. Large accessions to its membership have been recorded within the last few weeks.

## THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Oct. 31-Nov. 7...—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 30-Dec. 7...—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 23-Jan. 4...—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.

#### Races, Hill-Climbs, etc.

- July 25-28.....—Providence, R. I., Annual Meet of the Federation of American Motorcyclists.
- July 26.....—Reading, Pa., Automobile Carnival and Races, Berks County Fair Grounds Track, Reading Automobile Racing Association.
- July 27.....—Schooley Mountain Hill Climb, near German Valley, N. J. W. J. Morgan, manager, Bretton Hall, New York City.
- Aug. 1.....—Algonquin, Ill., Hill Climb, Chicago Motor Club and Chicago Automobile Trade Association.
- Aug. 5-10.....—Atlantic City, N. J., Automobile Carnival, Atlantic City Automobile Club.
- Aug. 9-10.....—New York City, Brighton Beach Track, 24-hour Automobile Race, United States Motor Racing Association.
- Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Oct. 19.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

#### Motor Boat Races.

- July 20.....—New York to Marblehead, Mass., 270-mile Motor Boat Race, New Rochelle Yacht Club.
- Aug. 13-15.....—Chippewa Bay, St. Lawrence River, Gold Challenge Cup Race, American Power Boat Ass'n.
- Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.
- Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

### FOREIGN.

#### Shows.

- Sept. 28-Oct. 7...—Denmark, Copenhagen International Automobile Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1...—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.

#### Races, Hill-Climbs, etc.

- July 25.....—Ardennes Circuit, Belgium (German rules).
- July 26.....—Ardennes Circuit, Belgium (Tourists).
- July 27.....—Ardennes Circuit, Belgium (Grand Prix rules).
- July 31-Aug. 8...—Belgium Regularity Contest for Touring Cars, A. C. of Belgium.
- Aug. 1-7.....—Criterium of France, 1,750 Miles Touring Competition and 250-mile Race for the Press Cup, A. C. of France.
- Aug. 3.....—Isle of Wight, British International Cup, Motor Boat Race.
- Aug. 11-29.....—France, Coupe de Auvergne.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.
- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 13.....—France, near Paris, Dourdan Kilometer Speed Tests.
- Oct. 20.....—France, Gaillon Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- July 14, 1908....—Paris to London, Aerial Race.

SPECIAL ANNOUNCEMENT.

We desire to inform our readers that we have purchased the "Automobile Magazine," with copyrights, cuts, advertising contracts and its entire subscription list, and the same will be consolidated with THE AUTOMOBILE. The "Automobile Magazine" has been published for the past nine years, and was the second automobile publication established in the United States.

THE AUTOMOBILE (published weekly) is to-day the outgrowth of the following consolidations: The Motor Review (weekly) and The Automobile (monthly), May, 1902; Dealer and Repairman (monthly), October, 1903; and The Automobile Magazine (monthly), July, 1907.

Time to Give the Tire Maker His Due.

The present season has been marked by a number of prominent contests of a degree of importance unequalled in past years, and in every one of them the performance of the competing cars has been a matter for congratulation. Beginning with the Targa Florio, probably the most severe racing test of a car ever held, but which suffers somewhat from the remoteness of its venue, down through the many road races and endurance tours such as the Emperor's Cup, the Herkomer, the Tourist Trophy, the Grand Prix, the Sealed Bonnet Contest, the Scottish Reliability Trials, and a number of others recently reported, the uniformly excellent showing of the cars as a whole has been little short of marvellous, while the accidents that befell the unfortunates have been of such a trivial character on the whole as to constitute prac-

tically a negligible factor when calculating auto reliability. But in none of them has the time maker received his due. Tire trouble there was and always will be, as a matter of course, but the manner in which it has been minimized by the study and improvement lavished upon his product by the maker has never been more strikingly illustrated than during the past season. Tire troubles formed a comparatively insignificant cause of delay in such exceedingly strenuous races as the Targa Florio, Grand Prix and Emperor's Cup. In the Herkomer, the Tourist Trophy and the Scottish Reliability Runs, and particularly the last-named, there was so little as to call forth almost universal comment in the reports of these events, while the climax may be said to have been reached in S. F. Edge's recent startling performance at Brooklands, when a single set of tires was run for 500 miles at an average considerably in excess of sixty miles an hour, and were then only changed as a matter of precaution, though the severity of the duty imposed upon them may be gauged from the fact that the pace caused the dissolution of the specially prepared roadway of cement at the banked turns in a manner that showed it was never intended for such gruelling. Doubtless the outcome of the present A. A. A. tour now under way, and which passes over some pretty rough country, will but add another triumph to the already long list. It is certainly time that the tiremaker was given his full due instead of being eternally blamed for the inherent weakness of his product.

Clearing the Dash of Its Useless Encumbrances.

Early builders doubtless were of the opinion that a multitude of impressive looking devices spread upon the dash of a car gave it an air of mystery and clothed the manipulator of such an imposing array with a degree of importance that was far from genuine. The art of properly driving and maintaining an automobile on the road is one requiring far more than the modicum of skill which is the sole asset of many handlers of the wheel, but the task does not gain in importance or rank by reason of such an appeal to the uninitiated observer, who, after all, is the only one thus awed. It will be recalled that a Windy City autoist, not content with the manufacturer's efforts in this direction, set the extreme of fashion in this respect.

Fortunately, the precedent thus attempted to be established was not followed in other instances, and since that time the makers themselves have been aiming in the opposite direction, so that it is now nothing unusual to see a car of recent date with nothing more than the coil and a single sight feed on the dash. There is usually also a switch, but generally it is combined with the coil box. With the limitations imposed by present methods of construction this probably represents the extreme of simplicity now attainable, but that there is a tendency on the part of designers to pattern after the example cited anyone who has observed the dashes of the most recent models and compared them with those of former years cannot have failed to remark. The tendency is one in the direction of simplicity that is to be commended.

Has the Limit of Weight per Horsepower Been Reached?

It is not long ago that the advent of what has since developed into a special form of the internal combustion motor for aviation created considerable of a stir by the extreme it appeared to represent in the way of an approach to the minimum amount of weight per horsepower. To go back quite a few years, it will be realized that the standard automobile motor of to-day scarcely weighs any more per horsepower, if as much, as did some of these early attempts at building light motors that were universally regarded as freaks. Ten pounds per horsepower was at one time regarded as a perilous approach to a low limit in this respect, but to-day there are few automobile motors that exceed this. Since then the limit has receded, pound by pound, until it is now considerably less than half this standard, as represented by a French motor recently constructed for aviation and rated at 35 horsepower on slightly less than a hundredweight of metal.

**OHIO A. A. STATE ASSOCIATION MEETING.**

CLEVELAND, O., July 15.—The annual meeting of the Ohio State Automobile Association was held at the Hollenden Hotel last Wednesday, representatives from Cleveland, Akron, Cincinnati, Elyria, Lima, Youngstown and Springfield being in attendance. The election of officers for the ensuing year resulted as follows: President, F. T. Sholes, of Cleveland; first vice-president, T. Neff, Cincinnati; second vice-president, T. Arthbert, Lima; third vice-president, G. E. Mental, Springfield; fourth vice-president, A. L. Garford, Elyria; fifth vice president, Dr. L. S. Colter, Cincinnati; secretary, Henry H. Hower, Cleveland.

Plans for the strengthening of the organization in the Buckeye State were discussed at length, and it is the intention of the new board of officers to make the association a powerful factor in legislative and road improvement matters. Energetic steps will be taken at once to organize clubs in Toledo and Columbus, and have them join the State body. The following standing committees were selected:

Executive—George Collister, Cleveland; H. L. Morse, Cincinnati; Windsor T. White, Cleveland; Val Duttonhofer, Cincinnati; A. Ward Foote, Cleveland.

Good Roads—Asa Goddard, Cleveland; M. P. Colt, Lima; J. L. Elliot, Springfield; W. P. Murray, Cleveland; Harry Crane, Cincinnati.

Legislative—W. Smith, Cincinnati; C. D. Crites, Lima; H. H. Johnson, Cleveland; H. Vail, Cleveland; Paul Staley, Springfield.

Membership—Dr. L. S. Colter, Cincinnati; E. R. Curtis, Lima; George E. Mental, Springfield; Walter C. Baker, Cleveland; H. Andress, Elyria.

**TEXAS AUTOMOBILE LAW GOES INTO EFFECT.**

DALLAS, TEXAS, July 13.—House Bill No. 93, introduced by Representative Ridgway, and passed by the last Legislature, went into effect in Texas yesterday, and owners of automobiles must register them with the County Clerk of the counties in which they reside. Section 1 of the bill provides that "all owners of automobiles or motor vehicles shall, before using such vehicles or machines on the public roads, streets or driveways, register with the County Clerk of the county in which he resides. As owner, each name shall be registered by the county clerk in consecutive order in a book to be kept for that purpose, and shall be numbered in the order of their registration; and it shall be the duty of such owner or owners to display in a conspicuous place on said machine the number so registered, which number shall be in figures not less than six inches in height. The county clerk shall be paid by such owner or owners a fee of 50 cents for each machine registered."

The penalty for failure to register with the county clerk is fixed at not less than \$5 nor more than \$100.

**CONNECTICUT WILL TRY NO SPEED LIMIT LAW.**

HARTFORD, CONN., July 15.—The new automobile law which passed the Senate on Tuesday of last week was passed by the House the following Thursday. Representative Allerton, of the Committee on Roads, Rivers and Bridges, stands as sponsor for the bill, and says that it will bring at least \$40,000 a year in revenue to the State in registration fees. In the opinion of members of the General Assembly who are familiar with highway conditions, the new law embraces some of the best features of automobile legislation in the country. The bill has no prohibitive clauses on speed, except that it says that a machine running at a greater speed than twenty-five miles an hour for a distance of an eighth of a mile is being recklessly driven as regards the rights of others. The Governor, it is thought, will approve the measure, and if it goes into effect its working will doubtless be closely watched by autoists throughout the country, as a precedent of this kind has long been wanted in order to demonstrate the absurdity of the arbitrary limits now enforced.

**FRELINGHUYSEN OPPOSES VANDERBILT RACE.**

PLAINFIELD, N. J., July 15.—Due to his absence in Chicago, during much of the time of which he has been ill, State Senator Frelinghuysen has not been aware of the propoganda afoot to hold the Vanderbilt Cup race in this State in October, but has been immediately galvanized into life on hearing of it. He sent a telegram to the Senate without delay, protesting against its proposed action permitting the race to be held, and gave out a statement for publication in which he expresses himself as being strenuously opposed to the race. It reads in part as follows:

"I am violently opposed to any change in the automobile law, believing that the safety of human life is at stake, and the protection of our people is more important than the mercenary motives of a few and the satisfaction of the sporting instinct of the automobilists.

"I have been informed that the press of the State is almost unanimous in scoring the proposition to suspend the Frelinghuysen law and it shows conclusively that the contest is not wanted."

**MASSACHUSETTS' ACTIVE SIGN CAMPAIGN.**

BOSTON, July 15.—Bay State autoists are being called upon by the Massachusetts State Automobile Association, through its secretary, J. Fortesque, to co-operate with that organization in seeing that the signs called for by regulations and by-laws of the Commonwealth of Massachusetts relative to ways and bridges, are complied with. The legislation in question calls for the erection and maintenance of suitable guide posts by all towns with a penalty of \$5 for each omission or neglect to maintain the signs thus erected. As it is the duty of the various towns to attend to this matter, the association is calling on its members to report instances of any failure to do so. The sections of the law covering it are being sent out together with the letters. They read as follows:

Section 1.—Every city and town shall erect and maintain guide posts on the ways therein, at such places as are convenient for the direction of travelers, and at such forks and intersections of ways which lead to adjoining cities or towns.

Section 2.—Upon such guide posts shall be stated the name of the city or town or place to which each road leads and the distance to the same.

Section 3.—Every city or town which neglects to erect and maintain such guide posts, or a suitable substitute therefor, shall annually forfeit five dollars for every guide post which it so neglects to maintain.

**PREPARATIONS FOR INDEPENDENT'S SHOW.**

Compared with former years, it seems a trifle early to be making show preparations at the moment, but as the combined show of the Automobile Club of America and the American Motor Car Manufacturers' Association and the Motor and Accessory Manufacturers, Inc., takes place from October 24 to 31 this year, there is good reason for it. Members of the A. M. C. M. A. have already contracted for fully 85 per cent. of the main floor space of the Palace, which may be taken to indicate that their displays will be more elaborate than ever this year. As 1908 cars will probably be on the market by the end of August, there should be no delay in getting the exhibits ready.

**M. AND A. M. TO EXHIBIT AT IMPORTERS' SALON.**

At the joint meeting of the show committee of the Importers' Automobile Salon and of the Motor and Accessory Manufacturers, Inc., which was held last week, an agreement was reached by which the importers' show, to be held in January next at Madison Square Garden, will receive the sanction of the accessory makers, many of the members of their association having already requested the reservation of space pending the granting of the necessary approval. A large number of others have deferred the announcement of their intention to exhibit at this show until the fact that their association had definitely decided to grant it a sanction was made public, so there will doubtless be a representative showing.

# ALUMINUM FOR AUTOMOBILE CASTINGS

By E. BLOUGH, CHIEF CHEMIST OF THE ALUMINUM COMPANY OF AMERICA.

CONSIDERABLE misapprehension exists in the minds of automobile manufacturers regarding the characteristics of aluminum alloys, erroneous statements regarding their properties having appeared in a number of automobile journals. Even in the pages of *THE AUTOMOBILE* the tensile strength has been given as low as 9,000 pounds per square inch, and the statement made that such results are obtained in general foundry practice. The writer has had opportunity to do a great deal of work on aluminum casting alloys and has been in close touch with actual practice in this country and abroad and can state that a tensile strength much higher than 9,000 pounds can and should be obtained in regular foundry practice.

Pure aluminum can be cast into a number of articles, but it is not adaptable to general automobile work on account of high elongation and consequent lack of rigidity. However, when suitable alloying ingredients are added to pure aluminum the strength is immediately increased, as is also the resistance to deformation under stress. The alloying ingredients cannot be added indiscriminately and alloys secured with mechanical properties satisfactory for automobile work. Indiscriminate addition of alloying metals is very likely to produce alloys which are difficult to use in the foundry, due to high shrinkage, brittleness, crystallization, segregation, etc. For the above reasons satisfactory alloys are only obtained after careful and thorough study of the whole range of commercial possibilities. The addition of too small an amount of alloying ingredient will produce an alloy of too high shrinkage. When this alloy is cast it may crack in the flask. The shrinkage, on the other hand, may not be serious enough to produce this result, but may cause a casting strain which will only develop into a visible defect when the casting has been put into service. On account of the neglect of systematic investigation, as applied to developing proper alloys and the application of experienced engineering ability, many varying and indifferent results have been obtained from aluminum castings.

Considerable care must be taken with the casting of test bars in regard to their form and gating and the location of risers so that unequal strains are not produced and totally erroneous results obtained. It has been found that very sharp fillets will

cause them to break almost invariably at the fillet, due to the fact that the test bar on cooling caused a shrinkage strain to be produced in the fillet. It is very obvious that results from such abnormal bars should not be taken as criteria on the quality of the metal. Improper placing of gates and risers can produce the same result and must be guarded against.

The first step in automobile casting is the selection of the proper alloy. The physical properties of the aluminum alloys can be influenced to a very great degree by the addition of alloying metals. However, it has been found by experiment and long experience that the useful alloys are limited to certain compositions, which, however, have practicable variations.

Having selected the alloy which will meet the required conditions, the fulfilling of these conditions depends wholly upon the manipulation of the metal in the foundry. Given the proper alloy, ordinary foundry practice with reasonable care in moulding and melting will give uniformly good results. With extraordinary care and special methods of moulding, even better results can be obtained.

An aluminum alloy having the proper composition for the general run of automobile castings will have the following physical properties:

Tensile Strength	Elastic Limit	Elongation	Specific Gravity	Shrinkage
lbs. per sq. in.	lbs. per sq. in.	in 8 in.		in 1 ft.
21,000	12,000	1.4 per cent.	2.82	12/64 in.

Another alloy which has been in successful use for many years has the following properties:

Tensile Strength	Elastic Limit	Elongation	Specific Gravity	Shrinkage
lbs. per sq. in.	lbs. per sq. in.	in 8 in.		in 1 ft.
29,000	16,000	0.50 per cent.	2.99	11/64 in.

There are other alloys possessing still higher tensile strength, among which there is one having a tensile strength of about 42,000 pounds per square inch and an elongation of about 0.8 per cent. in 8 inches. However, it does not follow that the alloy with the highest tensile strength is the most suitable for any particular casting. The alloy to be used will depend a great deal upon the nature of the casting itself, as well as the nature of the service for which it is intended to be utilized.

## PATENT RIGHTS OF EMPLOYEES DEFINED.

WASHINGTON, D. C., July 14.—Inventors in the automobile world will be interested in a recent decision of the Court of Appeals of the District of Columbia, wherein the court ruled as follows:

"Inventors are often compelled to have their conceptions embodied in construction by skilled mechanics and manufacturers, whose practical knowledge often enables them to suggest and make valuable improvements in simplifying and perfecting machines or devices, and the inventor is entitled to protection from their efforts to claim his invention. At the same time an employee is to be protected from the rapacity of his employer also, and if in doing the work assigned him the employee goes further than mechanical skill enables him to do and makes an actual invention he is equally entitled to the benefit of his invention.

"Where an employee claims protection for an improvement which he devised while working upon a general conception of his employer, the burden is generally upon him to show that he made an invention in fact.

"To claim the benefit of the employee's skill and achievement, it is not sufficient that the employer had in mind a desired result and employed one to devise means for its accomplishment. He must show that he had an idea of the means to accomplish the particular result, which he communicated to the employee, in such detail as to enable the matter to embody the same in some practical form.

"The reduction to practice of an invention by an original inventor cannot be taken as a reduction to practice by another merely because the ownership of the claims of both may afterward become vested in the same person or persons. \* \* \*

## UTILITY AUTOS ON PACIFIC COAST.

SEATTLE, WASH., May 27.—The automobile has commenced to supplant the historic and picturesque stagecoach in the Pacific Northwest, the greatest activity along this line being in British Columbia and the Kootenay country. An experiment was conducted last year by the operators of the stage from Nanaimo to Alberni on Vancouver Island, a distance of 25 miles, and proved a success. This season two large cars have been added for passenger purposes and a Knox truck for baggage. Several cars are already operating between Victoria and Saanich, a distance of eight miles, the demand for this method of transportation being great, as well as rapidly on the increase.

The British Columbia State company has provided autos to cover the stretch between Vernon and Penticton, eight miles, and two routes out of Kamloops will mean daily runs for each car of 40 miles. From New Westminster to Port Moody, a distance of 8 miles, the auto appears to have a cinch on business, as the country is too hilly to ever be covered with electric lines. A large number of cars are now being used for sightseeing purposes out of Victoria. By this method it is possible for tourists to visit many of the picturesque spots of the island. The most recent line installed in Washington is between Everett, Hartford and Granite Falls, the autos meeting all trains at Hartford. At the present rate of increase the automobile stage will soon have a monopoly.

JUDGING from present indications it would seem as if 1908 were to be a six-cylinder year. It is evident that the uncertainty concerning this situation which prevailed last winter has been settled in favor of this type, as a large number of the old established makers who were on the fence, so to speak, when the six-cylinder motor was in question have resolved their doubts by announcing the addition of a car of this kind to their 1908 line, though their allegiance to the four-cylinder is unshaken. Besides these, there are a number of new makers who have come into the field with six-cylinder cars as the main feature of their production. The latest of these to make its appearance is the D. L. G., which hails from St. Louis, its initialed title representing the names of its builders, who are A. L. Dyke, B. Leibert and V. R. Givens, forming the D. L. G. Motor Car Company of that city, with headquarters at 3932 Olive street.

As will be seen by the illustration heading this page, a high-speed runabout on attractive lines is also to be a feature of the line, the chassis being the same in each case with the exception that its wheelbase is shorter by 17 inches than that of the touring car. Interest naturally centers about the motor, which has its cylinders cast in pairs with a somewhat unique valve arrangement in that the exhaust is situated on the righthand side and is operated direct while the inlet is situated in the center of the cylinder head and is actuated by a rocker arm. The carbureter is of the automatic type, while a Simms-Bosch high-tension magneto takes care of the essential of ignition, and a McCord ten-feed mechanical oiler supplies the lubrication, four of the leads being taken di-

rect to the main bearings. The motor dimensions are four inches bore by four and one-half inches stroke, and the motor is given the extremely moderate rating of 35 horsepower at 1,000 r. p. m. Cooling is by means of a Mercedes type honeycomb radiator supplied by a gear-driven centrifugal pump, supplemented by a fan.

The first step in the transmission of the power consists of a multiple-disk clutch, consisting of alternate plates of copper and steel, while the change-speed gear is of the sliding type with selective operation, providing the usual three speeds forward and reverse. Final drive is by propeller shaft to a Timken roller-bearing floating live axle. The front axle is also a Timken product of the I-beam type, while the suspension consists of Krupp oil-tempered crucible-steel springs of liberal dimensions and of a semi-elliptic type, the pressed-steel frame being raised in the rear in accordance with current foreign practice. The wheelbase of the touring car is 130 inches, while that of the runabout is 113 inches, the tread being standard in both cases and the tire equipment is also the same, consisting of 36 by 3 1-2-inch front and 4 1-2-inch rear. Two sets of self-equalizing brakes are centered in drums on the driving wheels. A Gemmer self-locking steering gear is fitted, with the usual type of control. The car has been specially designed throughout and is in no sense an assembled production, Mr. Leibert having been associated with a leading German builder for some years. He has devoted great pains to every detail of construction and material in evolving the design of this new six-cylinder type, considering it his masterpiece, and it is confidently expected that it will be heard from on the track and the road during the coming season.

## TRANSFORMATIONS IN CENTRAL NEW YORK.

By ROBERT BRUCE.

Automobile tourists are generally aware of the far-reaching road changes now in process in central and western New York, amounting for 1907 to a vast amount of new construction, the present effect of which is to greatly inconvenience the tourist. Probably the largest single contracts let in New York State up to this time, under the present highway law, have to do with portions of the main line between Albany and Rochester, closing several important stretches which, unless the tourist knows something about them in the beginning, are almost sufficient to become a puzzling barrier to his trip. The general situation, especially between Utica and Syracuse, is covered with thoroughness in the New York State section of the Blue Book up to the time of going to press of that volume; but even in the past three months great changes have taken place.

During the past week the editor of the Blue Book has traveled over the entire country between Syracuse, Utica and Schenectady, and sends *THE AUTOMOBILE* this information. At the present time the line between Syracuse and Oneida is open; this is as yet not much changed over 1906. From Oneida Castle east there are on the western end several miles of old road untouched; this is followed by a complete stretch of new State road open to the village of Kirkland. The single exception is one short stretch where work is now in process, but a fairly good emergency road is in use around it, in plain sight, therefore presenting no difficulties. The portion from Kirkland to New Hartford and Utica is closed at the present time. The best way to get around this is to continue east a short distance from Kirkland on the Seneca Turnpike to "Middle Settlement 4 Corners," thence through New York Mills and Yorkville.

From Utica east, what was formerly the best route on the north side of the Mohawk river from Utica through Deerfield to Herkimer and Little Falls, is entirely closed, and it is necessary to take either Rutger street or Bleecker street, through the Masonic Home grounds, turning over the West Shore railroad and the Erie canal, following the poorer road along the south side of the Mohawk river through Frankfort and Ilion to Mohawk. As the road between Herkimer and Little Falls is also closed, one making the eastbound trip from Utica should not continue through the village of Mohawk into Herkimer, as it will only lead to the necessity of turning back, or else plunging through work in process. However, if the tourist will watch for the small depot of the West Shore railroad at Mohawk, turning 90° right, immediately after passing the depot, (and before reaching the bridge over the canal), a narrow but passable road will be found which, with many turns, leads along the lower side of the river to Little Falls, crossing through the factory district and over the railroad into the center of that city.

Here is possibly the most important point on the main line for the tourist to know. Having run into Little Falls, one may travel the usual route on the north side of the river for about two miles only, coming to a frail suspension bridge crossing the Mohawk river at this point. Beyond the suspension bridge the usual route is absolutely closed by order of the State Engineer, a large sign to that effect being posted near the entrance to the bridge. It is important to cross this bridge and also the canal (both requiring care), turning left immediately beyond, running along the lower side from this point to Fort Plain. The route is not difficult to find or follow, but the road is narrow and horses less accustomed to automobiles than those usually met on the north side route are likely to be met. There are also three or four atrocious railroad crossings, requiring extreme care, especially where the West Shore is crossed on a down grade.

Running into Fort Plain, turn 90° left across the Mohawk river at that point, running up a short distance from the bridge to the main highway on the north side at the hamlet of Nelliston. Turning right at this point, the usual route between Utica and Schenectady is resumed, and there is no more difficulty all the way to Schenectady and Albany.

## GLEN ECHO DEFIES UNCLE SAM ET ALII.

WASHINGTON, D. C., July 15.—Attorney-General Bonaparte, in fitting and weighty legal language, has rendered his opinion that the little spot on the map called Glen Echo—a suburb of this city—has no jurisdiction whatever over the Conduit road. That the latter is Federal property, and in consequence the high-handed hold-ups and endless fines collected have all been illegal. But Glen Echo is belligerent and after listening to a fiery speech by its boy Mayor, the Town Council not only decided to stand to its guns, but issued a defi by cutting the limit of twelve miles an hour in half. From now on, or at least until the Government puts its thumb on the spot in Maryland, the only safe way for an autoist to pass through it without paying dearly for the privilege will be to get out and push his car, being sure to have the engine stopped while doing so, as the Mayor has been authorized to assess the limit of \$50 in every instance. He cannot push without fear of being punctured from behind by a 44-caliber revolver bullet if he exceeds the speed limit, for the belligerent Marshal Collins, who is in the Mayor's class, as he can only lay claim to having seen twenty-four summers, is reported to have reconsidered his intention to resign for the excitement of "tendin' store" behind the counter in his brother's establishment

### MARSHAL COLLINS MAKING AN ARREST AT GLEN ECHO, MD.

in Philadelphia, and is still on the road, while the supply of ammunition is plentiful. Glen Echo wants to know what the Government is going to do about it, and proposes to enrich the town treasury still further by making the speed limit six miles, and the State of Maryland is backing up its belligerent hamlet. Mayor Garrett and Marshal Collins will fight to the death and the Town Council says ditto whenever they speak, so that it would appear to be the Attorney-General's move. His opinion holds that the laws of the State of Maryland confer no authority on the town's Mayor to impose fines, either for offenses against the municipality or against the State, and that Congress has the exclusive right of jurisdiction over the entire length of the Conduit road and has had ever since its building in 1859.

### TIME SAVING TO CATCH A TIME-SERVER.

WILMINGTON, DEL., July 8.—Detective James L. Hawkins, who is connected with the office of Attorney-General Richards, has branched out all of a sudden as an automobilist, and a genuine one at that. A few days ago he received a telephone message asking him to go quickly to Claymont, six miles away, that one man was assaulting another and serious trouble was feared. The detective called up a relative who has an automobile. When he got to Claymont he found the man said to have caused the trouble tied to a tree and brought him back to the city. Only forty minutes was consumed from the time Hawkins left his office until he was back again with his prisoner and the road was not in very good condition either.

**DETAILS OF EDGE'S RECORD 24-HOUR RIDE.**

LONDON, July 1.—Straightaway after its official opening the new Brooklands track has gained worldwide renown by the 24-hour record ride of S. F. Edge and his Napier car. Prompt to time the green 60-horsepower six-cylinder car glided off the mark with its red and white companions to add interest. This additional feature was a lately formed idea to test the possibilities of three sister cars on which change of drivers was made every three hours.

A sixty-an-hour pace was reached the first lap of the three-mile course and with monotonous regularity the green car set up a steady speed of seventy miles an hour, the other contestants trailing close in the rear. These companion cars were there to race and not to give pace to their principal, added interest being lent by the fact that these cars represented the rival interests of the works and the London agency. Soon after the start Edge began to draw away and just inside the first hour he lapped both the others. The close of the first hour showed a 70-mile total for Edge and 66 3-4 miles to the credit of the others who stuck within a few yards of each other for the first few hours; in fact, at the 100-mile mark the white car led its rival by but two seconds. Two hours from the start Edge stopped a few seconds for water and again later on for a change of tires, though but little time was lost.

**Weird Scene Through the Night Hours.**

As night came on the track was brilliantly lit up with big Well's lights, a row of small red lamps making the inner edge of the track. It had been intended to utilize big acetylene lamps on the competing cars, but practice spins showed this course to be unnecessary. Large tanks had been provided to hold sufficient gasoline for twelve hours run, so that not much time was wasted in refilling. Somewhat remarkable was the freedom from mechanical troubles, not a single stoppage for adjustment being required by the green or white car. The red car experienced hard luck; a heavy jolt over a rough spot at the outside of the track caused breakage of a rear spring and the twenty-five minutes delay thus occasioned was never recovered.

Right through the run Edge's green car showed itself superior in speed to its companions till at the end of the proceedings it had gained a lead of well over forty miles from its nearest rival. Contrary to anticipation no apparent reduction in speed was marked toward the close of the run, and in his twenty-fourth hour Edge covered 62 1-2 miles with no apparent effort.

**How the Miles Were Reeled Off.**

The distances accomplished by Edge in the successive hours are given herewith:

	Miles.	Yards.	Total		Average
			Miles.	Yards.	Miles per Hour.
1st hour	70	130	70	130	70
2d hour	70	1,190	140	1,320	70
3d hour	66	1,240	207	800	64
4th hour	64	860	271	1,150	67
5th hour	71	190	342	1,360	71
6th hour	64	470	407	60	65
7th hour	67	300	474	360	67
8th hour	63	750	637	1,210	63
9th hour	71	1,270	609	720	72
10th hour	60	480	670	1,200	60
11th hour	66	1,040	737	480	67
12th hour	62	1,120	799	1,600	63
13th hour	66	490	866	330	66
14th hour	72	150	938	480	72
15th hour	68	1,160	1,006	1,640	69
16th hour	61	521	1,068	400	61
17th hour	71	700	1,189	1,100	71
18th hour	63	1,490	1,203	830	64
19th hour	60	340	1,263	1,190	60
20th hour	64	20	1,327	1,190	64
21st hour	60	1,670	1,390	1,110	61
22d hour	68	790	1,458	130	68
23d hour	61	230	1,619	360	61
24th hour	62	960	1,681	1,310	63

The average for the whole distance equals 65 1-8 miles per hour. Second place was taken by the white car with 1,538 3-4 miles, while the red car covered a total of 1,521 miles, and this in spite of the fact that these two cars were driven by men who were relieved at stated intervals.

JUDGE DILL'S CORBIN PARTY LEAVING FOR MAINE.

**TRIO OF CORBINS ON A STRENUOUS TRIP.**

Without any preliminary blare of trumpets or announcement of their going, three Corbin cars left East Orange, N. J., last Thursday bound for what would ordinarily be considered considerable of an endurance run. Judge James B. Dill was at the wheel of the first, Winthrop E. Scarrit, ex-president of the A. C. A., handled the second, while F. W. Darnstaedt, from the Corbin factory, completed the trio, the third car being used principally as a baggage carrier. The guests on the run are Judge Foster of the New York City Court of General Sessions, Judges Reed and Garrison of the Supreme Court of New Jersey, and Mr. Scarrit's two sons. The trip planned is to end at Judge Dill's summer camp at Rangeley Lake and the route is via Saratoga, Lake George and the Adirondacks to Montreal, thence to Quebec and from there down through the famous Chaudiere Valley, thus covering much of the route of last year's A. A. A. tour.

**A PREMIER IN AMERICA'S DARKEST EGYPT.**

CAIRO, ILL., July 15.—The rest of the country is probably not aware that this part of the State of Illinois is locally known as Egypt from the fact that it lies between the Mississippi and the Ohio rivers and is consequently under water for the most part. As a result, automobiling is not an ideal pastime there, but still there are a number of cars in the town situated on America's Nile and the accompanying photograph depicts one of them—a Premier 24, owned and driven by Leo McDaniell, who, together with a number of fellow autoists, placed their cars on a river boat and shipped them to New Madrid, Mo., recently, to attend a meeting of the Southeastern Missouri Drummers' Association. Automobile races were part of the fun and the Premier carried off the honors, besides getting a prize as the handsomest automobile.

THE PREMIER THAT HELPED ENTERTAIN THE ROAD KNIGHTS.

DUKE OF ABRUZZI IN A BOSTONIAN'S LOCOMOBILE.

On the occasion of his visit to the Hub, the Duke of Abruzzi, well known for his fame as an explorer, and who came over to represent the Italian Government at the recent opening of the Jamestown Exposition, took advantage of an invitation to see Boston from the front seat of a Locomobile.

### READING TO HOLD AN AUTOMOBILE CARNIVAL.

READING, PA., July 15.—Friday, July 26, has been set as the date of the automobile carnival and races to be held in this city under the auspices of the Reading Automobile Racing Association. The programme leads off with the race meet, which will take place under the sanction of the American Automobile Association at the Berks County fair ground, the track of which will be banked for the occasion. There will be six races in all, of two, three, five and ten miles, for cars of different classes. In addition to an obstacle race, which opens the programme, followed by a motorcycle race, while event No. 6 is a one-mile gymkhana race in which the driver must get out at the quarter, put on a pair of goggles, stopping again at the half to take a duster out of a suit case, reclosing the latter, and again coming to a halt to take on two passengers with parasols at the three-quarter mark. The races will be preceded by a parade and street carnival in the morning, in which prizes have been offered for the most beautifully decorated car, as well as the most grotesque ornamentation, and also for the neatest and best equipped car. To close the day's programme a ride will be given a number of city's poor children.

THE AUTOCAR TEAM AND ITS LUCKY MASCOT.

Not all the victories of the Autocar this year have been won by the cars turned out at the factory at Ardmore, Pa. The men who make the Autocars have been even more victorious, for their well-organized baseball team has not lost a game, though it has been in the field all season. The mascot on the radiator is Norman Smith, Jr., son of the second baseman.

### PEORIA COMPANY ASKS AN EXTENSION.

PEORIA, ILL., July 15.—Finding itself unable to meet its obligations promptly, the St. Louis Motor Car Company called a meeting of its creditors last week, with a view to making some arrangements by which it can continue business. Jesse French is president of the company and the principal indebtedness of the firm consists of \$70,000 borrowed money, for which he is security, while the other creditors' claims—mostly for materials supplied, total about \$30,000. Mr. French explained to the creditors that there were about thirty cars in the course of construction, and that if they can be completed sufficient can be realized on them to satisfy the smaller creditors, at the same time offering to hold back his own claims in order to permit the company to reorganize and try to get on its feet. He accordingly suggested that a committee be appointed to run the works for the length of time necessary to complete the cars now in process, with the alternative of throwing the company into bankruptcy. It is probable that his suggestion will be acted upon and a committee appointed to take charge of the works. The plant was started here in 1905 and has employed about 100 men ever since. The president of the concern is a well-known financier with headquarters in St. Louis, while his son, Jesse French, Jr., is vice-president and manages the concern.

PRINCE FUSHIMI'S POPE TOLEDO ACROSS THE BORDER.

While in Canada last month, Prince Fushimi, who is a member of the Japanese Imperial family and a member of the Japanese Supreme Council of War, utilized a Pope-Toledo touring car to make a number of side trips in many parts of the Dominion from the private train in which he constantly traveled.

### THINGS INTERESTING FROM TIREVILLE.

AKRON, O., July 15.—An interesting competition has been on between the Diamond and Goodrich companies to lead in furnishing the tires for the machines in the Glidden tour. The figures as given out by the Goodrich company are as follows: Official count shows a total of 72 cars, of which 37 are equipped with Goodrich tires, 30 with Diamond tires, 3 with Dunlop, 1 with Fisk and 1 with Morgan & Wright. The Diamond company's figures are as follows: Out of 78 cars, 35 are equipped with Diamond tires, 35 with Goodrich and 8 scattering.

The annual convention of the traveling salesmen of the Firestone Tire and Rubber Company was held this week, closing Tuesday night. Twenty-three of the salesmen were present, and all went to Cleveland to see the start of the Glidden tourists. The company treated their men royally while here, entertaining them at the Country Club. Business meetings were held at the offices, President H. S. Firestone presiding. It was reported at this meeting that the business of the company increased considerably the past year, the sales having been greater in the past twelve months than in the whole history of the concern previous to that, which is saying a great deal.

**FINAL DECISION IN ACETYLENE BURNER CASE.**

CHATTANOOGA, TENN., July 15.—After having litigated the matter for six years, a decision declaring the Dolan patent, No. 589,342, granted August 31, 1897, invalid, has just been handed down in favor of the American Lava Company and Paul J. Kreusi, of this city, by the Circuit Court of Appeals. There were two actions, the first having as complainants D. M. Steward, M. Kirchberger, B. Von Schwarz, P. Von Frays and Charles W. Iden, while in the second D. M. Steward figured as the complainant alone. The patent covered an air-enveloping acetylene gas burner of the type now in universal use, and the contention was that it was basic and no burner would work on this gas without carbonizing unless made according to its principles. When first tried, Judge Clark, sitting in the U. S. Circuit Court, declared against the defendants and caused a permanent injunction to issue, restraining them from further manufacture of the burners in question, including some seven different types. Shortly after this the American Lava Company brought out a different type, against which the second action was instituted, and a second injunction was granted against the defendants and later suspended on the filing of bonds to the extent of \$6,000 by the defendants. The Circuit Court of Appeals has now ended the litigation by declaring the patent invalid and reversing both of Judge Clark's decisions. The decision was based on the ground that the construction had been anticipated by Bullier in France.

**PANAMA'S RULER AND FAMILY IN A STEARNS CAR**

While on his visit to New York, President Amador of Panama and his family were whisked about the metropolis in a big Stearns touring car and were highly delighted with the new method of locomotion of which Panama can boast but few doubtful examples in the shape of some cars of ancient vintage.

**BELGIUM'S ROUTE ROYALE OPENED.**

OSTEND, BELGIUM, July 15.—The Route Royale, Ostend's special automobile track, was inaugurated to-day by the holding of a race meet. Unfortunately but few heavy machines were present, so that no phenomenal performances took place, but the new road which has been especially designed for automobile speeding has a remarkably perfect surface, which is considered to surpass that of the new Brooklands track. And it has all the disadvantages of the latter in superlative degree, from the spectator's standpoint, for the highest speed of the most powerful touring cars looked commonplace and only the Darracq and Mercedes saved the meet from falling flat. The distance is five kilometers in opposite directions—that is, with and against the wind—and as the latter was very strong only the big cars made a showing against it. Riga in a Darracq made the fastest time in 2:28 with the wind and 2:38 on the opposite stretch, with Baron de Caters next in a Mercedes, which did it in 2:44 and 2:49.

**THE RECORD-BREAKING MORA AT THE FAMOUS WHITE HORSE INN.**

S. H. Mora, president of the Mora Motor Car Company, at the wheel; T. W. Martin, vice-president, beside him, and C. L. Crothers, in the Mora Racytype that has created a new world's record by covering a total of 3,219 miles, the entire distance being made under sealed bonnet conditions.

**AMERICAN WINS FIFTY-MILE RACE AT ST. LOUIS.**

Later information from St. Louis is to the effect that at the Fourth of July race meet held in that city, the American car was victorious in the 50-mile event for touring cars, which was a feature of the day. In printing the summaries of the Lowell, Mass., in last week's issue of THE AUTOMOBILE, a seeming injustice was also done the same car by crediting the Stanley steamer as being the winner of the mile free-for-all event in :45 1-4, whereas the honor should have been given to W. A. Fredericks, driving the American Roadster, who did the distance in :45 flat, making the best time of the day, as stated in the body of the report.

**CHARGES AGAINST OLDFIELD DISMISSED.**

PORTLAND, ORE., July 10.—Barney Oldfield, who was recently arrested here on a charge of obtaining money under false pretenses by making use of the name of the local club to boom a race meet without the former's sanction, has made a written statement of the circumstances surrounding his connection with the affair which was perfectly satisfactory to the complainant and the charges have accordingly been withdrawn.

**AMERICAN CARS TO BE SHOWN IN DENMARK.**

COPENHAGEN, July 5.—Among the manufacturers of American cars who have already signified their intention of exhibiting at the show to be held here in the fall are the makers of the Ford, Reo and Rambler machines, and they have planned their exhibits on a scale which will place them on an equal footing with the English, French and German makers who will be here to bid for business in full force, as there is no home industry.

**A LITTLE CADILLAC IN THE POSTAL SERVICE IN HAWAII.**

Wherever they are met with, the little single-cylinder Cadillacs are found doing strenuous and exacting duty, as witness the one shown in the photograph, which with 1,000 pounds of mail sacks and a post-office inspector and additional passenger negotiates the mountainous roads of the island.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Itala Import Company, of New York City, reports the arrival and sale of its first six-cylinder model.

The Standard Automobile Renting Company, of New York City, has just been organized to carry on the business of renting touring cars, and has placed an order for three Lozier 40-horsepower cars.

The F. C. Stanford Manufacturing Company, Dewey Court, Bridgeport, Conn., are now making a specialty of automobile repairs that require welding, as they have unusual facilities for work of this class, in addition to the manufacture of automobile parts and sheet metal work, of which they turn out large quantities.

A contention of the American Motor Car Manufacturers' Association is that the medium-priced car is the best seller, and offers as proof that there are 7,500 Fords on the road. The association has long advised its members to build at least one model that will sell at a medium price, and points out the popularity of the Ford, Maxwell, Mitchell, Reo and others as conclusive evidence.

Ford cars are cutting a wide swath the world over, for right upon the heels of their meritorious showing in the Scottish reliability trials comes the announcement that both the four-cylinder runabout and the six-cylinder touring car made perfect scores in the Irish event of the same nature. The runabout made the fastest time in its class in the hill-climb, and received a certificate testifying to a "high-gear run" during the first two days.

Recognizing that the demand for high-class autoing apparel was not being more than half met at the Hub, the William H. Richardson Company, 388 Washington street, Boston, has opened a motor apparel department, which, as they state, is "complete to the smallest essential." They will carry a large stock of everything for the autoist, including imported lines, among which Burberry's English motor garments figure largely, while chauffeur's outfits will also be made to order.

Five consecutive scores in five consecutive starts in as many weeks is claimed by the Winton Motor Carriage Company as a record for reliability. The fifth score was made by a Winton Model M in the endurance run of the Bay State Automobile Association, Boston to Keene, N. H., and return, July 6. Thomas F. Walsh, the millionaire mine owner of Denver and Washington, has placed his order for a Winton Model M limousine, finished in royal blue.

The J. S. Bretz Company, Times Building, New York, American representatives of Fitchel & Sachs, has received advices from England that the Napier car, driven 1,581 miles in 24 hours on the new Brooklands track, at Weybridge, England, June 28-29, was mounted on F. & S. bearings. The Bretz Company has already received advices that the winners in the recent Herkomer tour in Germany, the German Emperor's cup race, the Grand Prix, the Targa Florio, the Graphic trophy and the Swiss heavy-wagon competition were all mounted on F. & S. annular ball bearings.

Extensive investigation is being made by the Hess-Bright Manufacturing Com-

pany, Philadelphia, Pa., to ascertain exactly how much wear occurs in a properly made ball-bearing after long use, and every opportunity to examine the bearings of cars that made considerable mileage is availed of for this purpose. The ball-bearing chankshaft of a Stevens-Duryea Bix Six, that had seen 8,000 miles' running, was recently examined, and it was found that the endwise play had been increased by amounts varying from 0 to 0.001 inch, while the radial play had been increased by amounts varying from 0 to 0.0001 inch, the original endwise play in new bearings being 0.021 inch and the radial play 0.0002 inch. It is practically impossible to adjust a plain bearing to as fine a point as displayed by these ball-bearings after 8,000 miles' wear.

That it is possible for an electric to travel almost twice as far on a single charge of the battery when operated on the low speed than when run on the high is the result of exhaustive experiments recently made by the Studebaker Bros. Manufacturing Company, South Bend, Ind., with one of their cars of this type. The car used was a Studebaker electric victoria-phaeton, weighing 2,000 pounds, and which had been in daily service for six months prior to the tests. On the first trial the car was operated at its lowest speed over a two-mile course, and ran for twenty-four hours before exhausting the battery, in which time it covered 154 miles. The second trial was made on the second speed, and it covered 135 miles in 15 hours, while on the third speed it traveled 101 miles in eight hours. The final test on the high speed carried it 82 miles in six hours; but, as the car is only rated to cover 40 miles on a charge, it delivered 100 per cent. more mileage on the high speed, and 150 to 285 per cent. in excess of its rating on the lower speeds.

### RECENT TRADE REMOVALS.

The Motor Car Equipment Company is now located in its new uptown quarters, at the southwest corner of Fifty-fifth street and Broadway, in the heart of automobile row, which are generally considered to be the finest of their kind in the city, if not in the country. A most complete line of accessories and clothing is carried, including many well-known specialties, of both American and foreign make, for which this company is the exclusive selling agency.

Bag and baggage, Joseph F. Gunther now finds himself on Michigan Avenue, Chicago's famous automobile row, with all the Ramblers, big and little, his can of gasoline and his bottle of lubricating oil, and he is there to stay. The move has not been a sudden one, for during the past two months or more both the new quarters and the old, on Wabash Avenue, have been utilized; while, more than that, the stock of Ramblers has been so completely disposed of that the actual moving consisted of but little more than the migration of the Gunther staff and the transfer of the fixtures.

### NEW AGENCIES ESTABLISHED.

Woodworth leather treads and the "Kant-Skid" tire grip have settled down on New York's automobile row, a branch

having been opened recently at 1,662 Broadway, which is in charge of Fred Blumenfeld, who has had considerable experience in tire protectors.

Following out its policy of covering the entire country with a network of facilities, so that no district of importance shall be without them, the Prest-O-Lite Company, of Indianapolis, Ind., will shortly open new charging plants, one of which will be located in Los Angeles to take care of the lower coast trade, while the other will be in Pittsburg, Pa.

The New England Motor Company, of Lowell, Mass., makers of the Rex accumulators, have just opened a branch store at 163 Columbus avenue, Boston, and the same company has provided for its metropolitan interest by opening an office at 25 Broadway, New York City the latter having been found necessary in order to take care of the increased demand in this quarter.

### PERSONAL TRADE MENTION.

R. D. Henshaw, who has long been well known to the automobile trade, has just joined the sales forces of the Pope Motor Car Company, and will handle the Pope-Toledo cars in the New England States from now on.

A rumor to the effect that Charles B. Shanks, general sales manager of the Winton Motor Carriage Company, Cleveland, O., had resigned came as news both to the Winton Company and to Mr. Shanks, as it was the first they had heard of it. There was no foundation for the report.

Though not made public at exactly the same time, George H. Strout, sales manager of the Electric Vehicle Company, Hartford, Conn., handed in his resignation, together with President Budlong and Hiram P. Maxim. Mr. Strout is at present on a business trip in the West, and his resignation is to take effect on August 1, after which he will take a short vacation before becoming identified with another automobile factory. He has been identified with the bicycle and automobile industries for the past thirteen years.

Right on the heels of the announcement that Ezra E. Kirk had severed his connection with the Kirk Brothers Automobile Company, of Toledo, O., which he entered after leaving the E. R. Thomas Motor Company last spring, comes the notice that he is already again in harness as western sales manager for the Rainier Company. He will have charge of the territory west of and including Pittsburg and Buffalo, which has heretofore been under the supervision of President John T. Rainier and Vice-President Paul N. Lineberger. The erection of the big plant of the Rainier Company at Saginaw, Mich., has brought with it a largely increased demand for Rainiers in the Middle West, and hereafter Mr. Rainier will divide his time between the factory and the New York office, which will still continue to be headquarters, while Mr. Lineberger will act as eastern sales manager. There are few better known figures in the automobile world to-day than Mr. Kirk, who, like so many others in the field, is a graduate of bicycling days. He enters upon his new duties at once, and will have headquarters at Saginaw.

INFORMATION FOR AUTO USERS.

**"Eclair" Pump Connection.**—One of the many imported specialties of merit handled by Leon Rubay, 1697 Broadway, New York City, is the Eclair universal pump connection, a French novelty designed to lighten the task of tire inflation. It is attached to the tire simply by pressing it on, and removed by pulling it off. The accompanying illustration shows the joint complete, which consists of a compression chamber, hermetically

THE ECLAIR UNIVERSAL CONNECTION.

closed by a rubber washer of special construction, held in place by a metal disk which screws into a removable ring placed over the compression chamber, and is drawn up tightly against a flange by means of the metal disk, every part of the connection being easily removable. Exhaustive tests have shown that the washer will stand between 4,000 and 5,000 inflations before requiring renewal, which may be made in less than a minute. The joint is attached to the pump in the ordinary manner and sells for a dollar complete.

**National Portable Houses.**—This is a line of portable house in the manufacture and design of which the makers have paid particular attention to the needs of the autoist, their construction being especially well suited for both small and medium-sized garages. Though designed to be portable, and, as the name suggests, shipped in sections and thus set up, there is no limit either to the size of the house that can be built, nor to the variation of architectural detail that may be supplied according to the requirements of the purchaser. Thus the doors may be glazed or solid, the side walls may have any number of win-

ATTRACTIVE TYPE OF PORTABLE GARAGE.

dows desired, and the floor may be of hardwood or cement, the latter always being recommended for garage purposes. When the construction itself is concerned, this may be of V-jointed matched siding, in steel representing pressed brick or stone, or of fireproof composite construction. There is also a wide range of choice of roofing materials, such as wood shingles, waterproof canvas duck,

asbestos, steel shingles, plain sheet steel, tin, etc. Where floors are required, as in cottages, temporary office buildings, and the like, this is of narrow, 7-8-inch pine, properly dressed and matched, and laid on suitable joists. The sections are keyed into one another on an interchangeable system, and when erected are as rigid and permanent as the ordinary form of built-up construction. They are made by the National Construction Company, 604 Morgan Building, Buffalo, N. Y.

**The New Heitger Carbureter.**—After a number of years of study, devoted exclusively to the problem of carburetion on the automobile and the motor boat, F. H. Heitger, of the Heitger Carbureter Company, 205-207 West South Street, Indianapolis, Ind., has just placed a new carbureter on the market, for automobile, marine and stationary use, for which much is claimed. It is of the annular float type, with the jet centrally placed and the body of the carbureter and the mixing chamber directly above it. The carbureter outlet, governed by a butterfly type of valve, is located at one side of this chamber, and the spring-controlled

VERTICAL SECTION OF HEITGER CARBURETER.

auxiliary air valve at the other. The small plunger lever for facilitating a start is placed at the same side as the auxiliary air valve, while the needle valve is at the opposite side on top, so that all adjustments are in plain view and may be readily made. The Heitger carbureter is also designed to be easily installed on any make of car, as the throttle can be made to open and close from either direction and the lever can also be operated from any direction, while the gasoline feed opening is provided with a swivel joint.

**Hercules Shock Absorbers.**—In the present condition of the streets of San Francisco, which is in the throes of rebuilding operations, there is an active demand for shock absorbers, and the Hercules, made by the Hercules Auto Specialty Manufacturing Company, 115 Dearborn street, Chicago, which has but recently introduced its device on the Coast, finds that it is meeting with unusual favor there. Another instance of its success is to be found in the large order for Hercules shock absorbers recently placed by the president of an important jobbing house, who first gave the device a thorough try-out on his own car before setting the seal of approval on it in the shape of a substantial order. While similar in principle to many other shock absorbers, in that it interposes a

frictional resistance to the excessive play of the springs, it embodies special exclusive features, chief among which is the auxiliary cushion spring, which gives the car's springs plenty of play on smooth roads up to 50 per cent. of their

THE HERCULES SHOCK ABSORBER, COMPLETE.

movement, before the friction device comes into action so that the car does not ride stiff and uncomfortably. The accompanying illustration shows the device complete, ready for attachment.

**Holley Carbureters for 1908.**—It is a matter of common knowledge that the auxiliary valve of the average carbureter, on which feature it is entirely dependent for its automatic action in supplying a mixture that will be as nearly uniform as possible regardless of the speed of the motor, does not always fulfill its functions properly. The differences in air pressure and the amount of surface acted upon are so small that it is difficult to keep the spring properly adjusted for all conditions of working, so that it comes somewhat as a surprise to note that the 1908 Holley is announced as "an automatic carbureter without moving parts." To accomplish this the principle of the Venturi tube has been employed with excellent results. The Venturi tube is what may be termed a double bell-mouthed pipe, i. e., large at both ends and constrict-

SIMPLICITY OF THE NEW HOLLEY CARBURETER.

ed in the center, and it produces the anomalous action of discharging a liquid or gas with a greater velocity through the smallest section of the tube than that due to the impelling head alone—usually illustrated in lecture room experiments by using

two buckets of water, one with a plain hole in the bottom and the other fitted with one of these tubes the smallest section of which is the same as that of the hole in the other bucket. The bucket fitted with the tube will empty itself in half the time required by its duplicate. Referring to the sectional illustrations of the new carbureter presented herewith, the air enters at A, passing downward and up through a U-shaped tube, constricted at its lowest point; at the bottom of the U is the gasoline inlet B, regulated by the usual needle valve, while the mixture passes through a butterfly throttle to the motor at C. The float chamber surrounds the lower end of the U, this constituting a Venturi tube of special form, allowing a very high air velocity to be obtained at B by avoiding the throttling effect due to the usual irregular constricting arrangements. The float is annular and controls the fuel supply in the usual manner, but the gasoline level in the chamber instead of being lower as customary is about one-eighth-inch higher, so that it is not necessary to lift the gasoline by means of a vacuum as ordinarily done. At low speeds there is thus always a small pool of gasoline in the bottom of the U and mixture for this service is obtained by surface evaporation, the pool gradually disappearing before the air current as the speed increases, being replaced by the usual spray at very high speeds.

**Steward's Dolan Acetylene Burner.**—The production of a brilliant flat flame by one jet of gas through one opening briefly

this work was undertaken by Clarence S. Steward, who after several months study and experiment, succeeded in perfecting machines, which are now in operation, the company having contracted with the inventors for the exclusive right to manufacture the new burner. The results of tests made by the Department of Physics of Columbia

FLAME PRODUCED BY STEWARD'S DOLAN BURNER.

University show that the Steward's Dolan burner also has the great advantage of producing a greater amount of light with gas than the old type, giving an actual candle power of 35.6 on a consumption of .83 of

a cubic foot, or 40.5 candle power to the cubic foot, as against but .33 and 33.1 in the case of some English and German burners that were submitted to the photometric tests at the same time.

**Two New Reeves Motors.**—The Reeves Pulley Company, Columbus, Indiana, has recently turned its attention to the manufacture of two new types of water and air-cooled motors for commercial vehicle use and reports an excellent demand for them for 1908 deliveries. Model L is a 4 by 4 inch, four-cylinder water-cooled motor, rated at 22-24 horsepower. It is built throughout of the best obtainable materials, while the workmanship is of a grade usually associated with exclusive private designs rather than the commercial motor. All parts are made on carefully prepared jigs and templates, making them interchangeable, so that replacements may be promptly procured, and at reasonable prices. The crankcase is all aluminum, the upper half carrying the bearings and the lower acting merely as an oil pan, thus making it readily removable without disturbing any part of the engine. The crankshaft is turned from a solid hammered billet of specially tempered steel and is finished by grinding.

The bearings are all interchangeable die-cast bushings, made of special bearing alloy and hand-scraped to a true running surface. The pistons are of gray cast-iron, accurately turned and ground to fit, and are provided with four rings. The valves are drop-ported in one piece and ground; all are on the same side, actuated from one camshaft. The water jacket not only provides an ample quantity of water where most needed, but has also been designed to deaden the noise of the valves.

Model N is a double opposed 4 by 4 inch, 8-10 horsepower air-cooled motor. The crankcase of which is made of iron. The valves are 25 per cent. nickel steel, ground into cast iron interchangeable cages, which are removable. The valve lifters are case-hardened steel and are provided with a timing adjustment on the pushrods. The flywheel acts as the only fan necessary. In other respects the same painstaking care in construction and the same high grade materials are employed as in the Model L. This motor is made to run in either direction and may be mounted in any position on the car.

NEW MODEL N, 10-HORSEPOWER REEVES HORIZONTAL OPPOSED AIR-COOLED MOTOR.

tells the story of this new acetylene burner, which would appear to be destined to revolutionize practice in this field. Among its most obvious advantages over the present type of forked burner are its lack of fine orifices to clog up and the absence of necessity for having two impinging jets in proper alignment because it is likewise minus this feature of the current form in general use. This new burner is the invention of Edward J. Dolan and M. J. Tracy, of Philadelphia—the first-named being a pioneer inventor of acetylene burners, the type now in practically universal use having been brought out by him in 1897. After completing the invention of this new and improved form, it was found an equally difficult task to devise machinery to make its manufacture on a commercial scale possible. It took the inventors several years of patient work to turn out a few specimens properly by hand, and they were submitted to the D. M. Stewart Manufacturing Company, Chattanooga, Tenn., probably the largest makers in this line in the country. The task of evolving machinery to perform

RUNABOUTS

No. 104	Stod.-Day.	35	G. S. Smith	G. S. Smith
No. 108	White	30	H. K. Sherldan	H. K. Sherldan

TWENTY-ONE clean-score twelve-day endurance were ever called upon to ac-driven vehicle modestly began yesterday in New York City. start on Wednesday, July 10. that are a disgrace to the State tent and execrable highway in the mountains of Western Pennsantly interrupted by water-Maryland and gave a sublime toric country; turned north-and bumpy turnpikes of East-concluded on the macadam New Jersey. Nearly sixteen changeable American road, but mobiles are asked to travel

And it was done on a sched-fast on some days and too slow horsepower of your car—but a the ordinary tourist would at-

ing for pleasure or traveling for necessity, and, in consequence, furnishes no criterion for a touring time table.

Extraordinary conditions were further required in the matter of repairs, for the rules said that only yourself and your mechanic could work on the car, and then only with what you carried; if you used extra parts, there was penalization. At the finish of the day's run your car was taken away and did not return to your possession until the beginning of the next day's journey. Then, after you were on your way, you could give it the meager attention which all machinery should receive to enable it to perform most capably and enjoy a long life.

It was abusive and unusual, the treatment—or lack of it—which the cars received, and that they should survive and endure and proceed was a source of wonderment, more to those who knew and realized the exact conditions than to the thousands of on-lookers who did not comprehend the task to which the mud-caked and uncleaned autos were put as they willingly ploughed forward, intent upon reaching the goal in the metropolis of the country.

True, the rules may be vastly improved upon, there may be better but no more hard-working chairman than Mr. Hower, another year a more interesting route may be selected, and other things might happen, but the 1907 Fourth Annual Tour of the American

survivors of the very hardest touring to which automobiles accomplish since the motor-its cumulative career, ended Cleveland was the scene of the The route led over roads of Ohio; comprised both excel-Indiana and Illinois; traversed sylvania, with progress inces-bar jolting; dropped down into glimpse of picturesque and his-ward and followed the dusty ern Pennsylvania; and then thoroughfares of enlightened hundred miles of typical, of exactly the kind which auto-over every day.

ule which might have been too on others—according to the schedule far in excess of what tempt to accept either in tour-

Automobile Association was worth while: a benefit to buyers and a great proving test for the makers of cars. It should be viewed in its general aspects and the picking of flaws which undoubtedly existed will not wipe out the general good that has and will follow in the wake of such a big event—the most pretentious and best conducted affair of this character yet held in this country.

Fourteen different makes of automobiles grace the list of those which came through without any penalization. But, in all fairness, there should be taken into consideration the fact that not a few of those which suffered more or less depletion of their original 1,000 points through troubles that were either not mechanical or else of a minor nature, a half dozen or more in the finishing miles of the Canton-Pittsburg run—the worst link of the variable cross-country chain—met with punctures owing to the miserable road surface. These, despite the exceptional liberality of the police authorities in Allegheny and Pittsburg, were unable to reach the Hotel Schenley before the expiration of a schedule which on this particular day was a bit close and compelled cars having difficulties to do some tall hustling. And some of the drivers hesitated at racing through the streets even with a fairly good police protection.

The rules required a contestant who made replacements of parts other than what he carried along with him to become a non-contestant, and while some persisted and completed the long journey for the stubborn satisfaction of saying so, others could see little glory and a lot of useless work in this proceeding. In the carrying of these extra parts not a few of those who had no opportunity of gaining experience in previous tours were somewhat at loss to estimate what might be actually needed. The parts carried along did not always necessarily mean that the cars were weakest in these particulars, and more frequently that which was needed was of small cost and often it happened to be just the thing that had been left behind. Therefore, the list printed on another page is not mechanically valuable, but will satisfy the curiosity of those who speculated as to the assortment which might be carried for exceptional endurance emergencies.

#### "And Buffalo Retains the Glidden Trophy."

The Buffalo and Pittsburg clubs quickly became the real contenders for the possession of the Glidden trophy, the other clubs dropping out of the contest early in the race. When Buse of Buffalo went astray on the road and lost points, there was undisguised elation in the Smoky City camp. When Jones of that city smashed into a mail carrier's cart and did other similar stunts and lost more points than his unfortunate rival, the Bisons did some shouting which was loud and prolonged. Another year it is probable that more care will be taken in the selection of teams, and possibly they might be limited in number and several teams come from the same club. This is an idea of Mr. Glidden, who rode through the entire tour in Chairman Hower's car and naturally figured as a notable all along the line.

#### The Runabout Contest for the Hower Trophy.

When the call came, somewhat insistent, for the admission of runabouts on an equality with the touring cars, Chairman Hower came to the fore and supplied a trophy for this class. It was rather a matter of surprise that the runabouts incurred penalties, one after another, with great regularity until finally only two were

left—Sheridan with a White and Smith with a Stoddard-Dayton. These two drove with careful judgment and each day seemed to adhere to a steady pace that took not into consideration the doings of their opponents, some of whom appeared unable to resist the temptation of utilizing their horsepower and then loafing for an hour and often several before checking-in time arrived.

#### Enthusiasm All Along the Line.

From Cleveland to Chicago and back to New York City the autoing caravan was a source of attraction in every city, town and village, and often in the country there were picnic parties which had assembled for the sole purpose of watching the passing of the up-to-date users of the road. There has been established by the participants in endurance runs an inviolate rule that not one splash of mud shall be washed from their cars nor one speck of dirt removed from their clothing. Under ordinary conditions and attired in their riding garb, automobilists look somewhat ineligible for an appearance competition, but when they have proceeded for several days might easily be mistaken for "Weary Willies" of the road if they were proceeding on foot. "General" Coxey had some facetious comments to make at Massillon, and the inmates of an asylum in another town looked askance at the flying procession in such a way as to cause one to believe that those mentally bereft believed that the wrong ones were under surveillance. If someone will start a crusade for cleanliness among automobilists while on an endurance tour—admitting that more dirt will be accumulated on the following day, but why carry all the dirt which sticks—the public might be disabused of the idea that automobilism is the dirtiest kind of traveling.

But the progress of the 1907 tour was a source of enjoyment and great interest from beginning to end, and the attention of the thousands that saw and of the thousands more that read added immensely to the volume of automobile interest and enthusiasm which are evident in nearly every city and hamlet of the country—and certainly in all places that were on the route of the great tour just concluded.

#### Talk Even Now of a 1908 Tour.

What should be next year? was the matter discussed vigorously during the tour and at its wind-up. Chairman Hower believes that you cannot combine an endurance contest with a pleasure tour. Others have said so before, but this year's event was the third effort by the A. A. A. with a combination run. It must be voted a success and generally beneficial, but the room for improvement still remains and there should be careful planning, starting now for next year's run.

The tour this year was too long. One week is enough. In six days' running the abilities of a car can be demonstrated or its weak points discovered sufficiently to answer all practical purposes. A mid-day control will lessen the unnecessary physical hardships inflicted upon drivers and passengers and lend an essential innings of rest which will not lessen the strenuousness as far as the cars are concerned. Of course, there should be observers, and if any entrant selects an incompetent observer he will have only himself to blame, for if he is wise he will pick one of his most experienced engineers to ride in the cars of the other fellows. This accepts in advance the assurance that a contest with observers will be for makers and not for amateur owners.

## FINAL DAY'S RUN WAS THE EASIEST OF ALL

NEW YORK, July 24.—From Philadelphia to New York is slightly under a century, but the good roads of New Jersey are often quickly covered, despite the present law in that State. Confetti-Chief Lewis had as a companion in leaving Quakerville Dr. J. R. Overpeck, driving a Walter, who showed the most available route to reach the open country. At Trenton, the home of the Walter car, this concern gave basket luncheons to

the eager tourists, who, sniffing the salt air afar, were eager to reach Jersey City and feast their eyes upon metropolitan grandeur. Here the White Company thoughtfully supplied coffee and sandwiches at the checking-in place in front of the City Hall. Of course, there was a wait of a couple of hours until the entire cavalcade had arrived. Not a single one met with a penalty, and even the stragglers, who had been catching up for several days

past, shared in the somewhat dusty ride. The old-timers brought to mind the first "long" automobile ride ever attempted in this country, that of the Automobile Club of America from New York to Philadelphia, seven years ago, on which occasion the participants did not reach their destination until dark, and there were several that fell short of the checking-in place. Automobiling then and automobiling now are two vastly different propositions. Ferrying to Twenty-third street at 1:15 P.M., the dirt-grimed cars and the dust-covered occupants lined up in West Twenty-fifth street. Police Commissioner Bingham promptly responded to an eleventh-hour request for parade assistance, and a triumphal progress took the happy finishers over to Broadway and

up through the automobile district to Columbus Circle, where the final checking in occurred, photographs were made, and the great tour was all ended with the shouting, except for the totaling of the penalty columns, done later at A. A. A. headquarters. At the Hotel Astor in the evening, Chairman Hower called the tourists together for a final session. He congratulated them on the showing which they had made and thanked them for their aid in making the tour a success. Light refreshments were served, and many a good story of the event was told unofficially. An added and pleasing feature was the presentation of a silver loving cup to Mrs. A. Cuneo, given by the participants in the tour, who wanted to recognize her plucky driving of her Rainier.

TOM FETCH'S PACKARD AT THE APEX OF ONE OF THE PENNSYLVANIA MOUNTAINS, WHERE THE SCENERY THAT GREETED THE A. A. TOURIST WAS WILD AND PICTURESQUE.

## DEDUCTIONS OF THE TOUR THAT ARE SELF APPARENT

By F. B. HOWER, CHAIRMAN TOURING BOARD.

It must be one thing or the other—an endurance contest or a pleasure tour. The pleasure journey is no longer of any special value to manufacturer or user, and therefore it is my opinion that the 1908 event of the A. A. A. should be a prolonged endurance run, with every entrant providing a "scrutineer" or observer, who of course would ride only in the cars of other entrants for obvious reasons.

Each time the "scrutineer" took his place in a car he would be handed the list of extra parts carried, and at the conclusion of the day's run the results of his observations would become a part of the official records.

In touring nowadays a disabled car can often reach a garage or machine or blacksmith shop and accomplish sufficient repairs to continue to the end of the journey, but for using parts not carried, I repeat, there should be at least a five-fold penalty.

The purpose of a strenuous test is to enable the maker to correct the structural weaknesses in his car, and he can discover

these defects only by subjecting his product to extraordinary conditions. If his car has a fault he should be the first one desiring to find it out. It is safe to say that much has been learned by all the makers who participated in the run just ended. We asked far more of the cars than they might ever be called upon to perform, but I believe that in automobiles, like in other construction, there should be ability to withstand several times what may be met with in ordinary usage.

It is self-apparent that an endurance tour or any contest of this character should be conducted by a disinterested body rather than by the makers. The public naturally will look upon the event with greater favor under such circumstances, as it naturally stands to reason that the report of the results of such a test will be received as emanating from a source wholly untainted with the slightest suspicion of trade bias and, in consequence, be considered as authoritative and as having far more weight than they possibly could otherwise.

## DEPLORABLE CONDITIONS OF AMERICAN HIGHWAYS

By CHARLES J. GLIDDEN.

THE fourth annual tour of the American Automobile Association was witnessed by more people and created a greater interest than any event of its kind ever held in this country or any other. It has shown to the world the reliability of the American cars, the skill of the drivers, and revealed the deplorable condition of the highways of a prosperous nation.

Seventy per cent. of the roads would, by any European government, be closed to public travel and marked "use at your peril." The serious accidents were due wholly to the condition of the roads which were unknown to the drivers.

The contest for the Glidden Trophy by clubs has removed any possibility of a tie and increased the popularity of the tour. That far the Hower Trophy for high-powered runabouts

has brought into prominence a superior class of vehicles for touring by use of which economical drives can be made for long distances when it is not the wish of the owner to carry a large party, or a great deal of touring impediments.

The tour has been ably managed by the Touring Board, through its efficient chairman, F. B. Hower, and the foundation has been laid for future events in which a large majority of the clubs in the United States will participate and every prominent manufacturer be represented.

The contest is open to the world, and it would be interesting to know the record of foreign manufactured cars on American roads in a test of this character, as, outside of the wilds of Russia, Europe offers no such testing ground as this.

THIS IS A FAIR SAMPLE OF SOME OF THE "GOING" ENCOUNTERED BETWEEN CANTON, OHIO, AND PITTSBURGH, PA.

ROADS THAT WERE SUCH ONLY IN NAME TESTED CARS AND TRIED THE DRIVERS' SKILL.

**A**FTER twelve days' touring over roads as varied as possible for highways to be—the variety being not merely a matter of road surface but also of changing geographical conditions, it is an easy task to sum up with a considerable amount of accuracy the mechanical features developed by the A. A. A. tour.

A mere numerical declaration of the automobiles which left Cleveland on July 10 and of those which have survived to the end of the journey might cause the superficial observer to be unfavorably impressed with the value of the automobile as a touring machine. Of those having covered the 1,570-mile journey a certain number are incapable of further effort without a thorough overhauling, involving quite a stay in the shop.

Not more than thirty-five machines out of over seventy starters have reached New York in perfect condition, ready to go forth to further exploits without repairs or adjustment. The elimination of over 50 per cent. of the competitors on a twelve days' running schedule may lead critics to condemn the machines as unsuited for the work they are built to accomplish, and might cause prospective automobilists to hesitate in face of such an expensive pastime. Nearly 1,600 miles and 50 per cent. of the machines candidates for the hospital, the layman might muse, and decide to wait for the perfect automobile. But if the true conditions of the tour are understood, such a result will be considered as thoroughly satisfactory. The party toured—but not as ordinary mortals tour, for the average man does not perform herculean feats when he wanders round the country in an automobile or subject his car to maximum tests. Road conditions on the A. A. A. tour were such as are to be found in no other country in the world, and the daily stages and running times called for strains which no sane private owner would impose upon himself or his car. Briefly, a year's ordinary wear is compressed into a fortnight; to survive the fourteen days more than commonplace mechanical construction is required. A few who entered the run—and many who stayed out—were under the impression that the tour was a series of daily journeys under normal touring conditions. Those who have gone through the affair in any capacity know the enormity of their mistake.

Throughout the tour there has been a remarkable immunity from engine troubles. The run could certainly not have been made under sealed bonnet conditions, but there has been less tinkering under the hood than in any other competition of a like nature. One car cracked a cylinder, one retired with a broken connecting rod, another had serious magneto troubles, and there were various cases of broken valve springs, fan troubles, short-circuits, carbureter adjustments, and the like. On the whole, however, the power plants gave full satisfaction. With such heavy going as was met with on the outward run to Chicago and the strenuous hill climbing in Pennsylvania, where the engine was called upon to furnish its maximum power for several hours in

succession, the performance of the motors is thoroughly satisfactory. Leaky radiators were only small in number, and with few exceptions were the result of collisions and blows which would not have been met with under ordinary conditions. Very few motors showed signs of overheating, and more than one car traveled over the mountain stages from Canton to Baltimore without pouring a drop of water into the radiator. Such a performance speaks volumes for the efficiency of the engine.

The weak point of the machines was in their transmission and drive. Clutch, gears, shaft, differential and rear axles in some cases developed weaknesses of such a nature as to put machines out of the competition. One car abandoned with a broken clutch, five at least stripped their gears, and about half a dozen had broken or damaged rear axles. In three cases a broken truss rod was observed, two of which led to the rupture of the rear-axle housing and the total disablement of the car. A few others suffered so severely in this respect that, though they reached New York, their rear axle will have to be dismantled and entirely overhauled. Traveling over such rough roads as the Toledo-South Bend stage, the fast Canton-Pittsburg run, or the heavy pulling over the Alleghenies into Bedford Springs imposed enormous strains, as several makers of lightweight and poorly constructed rear axles found to their cost. On good roads, with minimum loads, the cars might have given years of satisfactory service, but when four passengers and heavy baggage had to be transported over bad roads at a rapid rate the driving mechanism broke down immediately.

Chassis suspension was discovered to be insufficient in a number of contesting and accompanying cars. Several drivers, anticipating trouble of this nature, carried spare springs with them, and had occasion to use them before the end of the trip. More trouble was experienced with front than with rear springs, three machines breaking both front springs and several suffering from one spring more or less seriously broken. Spring irons and rubber bumpers had frequently to be added on the way. When Chicago was reached some of those who had left home without shock absorbers decided that their presence would be useful, and forthwith fitted them to their cars. Few, apart from the perfect-score contestants, had perfect suspension, sufficient to give easy riding to the occupants of the car or immunity from breakage. Frequently the springs might have been lengthened and strengthened with advantage, and an efficient shock absorber added in front at least. Some of the most pleasing machines in this respect had springs of more than ordinary length for their seating capacity, and were fitted with a complete set of shock absorbers. A couple of cases were reported where the shock absorbers themselves were incapable of performing their work, one of them breaking away from the frame repeatedly. Corded springs were noted in a few cases, and one non-contestant im-

provided a set of rubber bumps out of a section of solid tire. Before checking in at the controls a number of drivers wisely paid close attention to the lubrication of their springs.

A very severe and at the same time unnecessary strain was imposed on the springs by the presence of water breakers, for there is no reason whatever why these should be allowed to remain on the highways. From Pittsburg to Bedford they were rather more annoying than dangerous, for, owing to the bad surface, cars rarely took the bumps at a rapid rate. From Bedford to Baltimore the breakers were a constant danger, for, with a car running over the good macadam from twenty-five to thirty miles an hour, it was impossible to slow for every bump, and the strain on the springs was enormous.

Friday, and especially Saturday, were "fierce days on brakes," as some of the drivers appropriately put it. Not that any car was totally inefficient in its braking system or suffered any injury through their failure to act, but on the whole they were shown to be not sufficiently powerful for continuous mountain work. As road conditions improve and mountain touring becomes more general, greater braking surface and more easy methods of regulating the brake bands will have to be adopted. No water-cooled brakes were observed, this practice, a common one on European machines built for mountain work, not having yet been adopted by American constructors. A few cars were obliged to stop to cool off their brake bands as a precautionary measure, and all those who had time to do it overhauled their brakes before checking in at South Bend. One non-contestant declared that he spent all Sunday putting his brakes into shape for the following day.

Steering gear gave very little trouble, there being but one case of a breakage under ordinary running and three disablements of greater or less gravity by collision with road objects. One machine had a stout hickory bar attached to the connecting rod, the driver declaring that it not only minimized the danger through a breakage of the connecting bar, but absorbed a certain amount of vibration.

Users of speedometers, and they comprised nearly every participant in the tour, declared that, although the instrument rarely became disabled, the fixtures were not sufficiently robust to stand the hard going. Several of the brackets broke. Some drivers, anticipating such a trouble, had two instruments, so that if one went out of business they were not obliged to run by guesswork.

## SEEN BY THE UBIQUITOUS SNAPSHOTTER.

By F. ED. SPOONER

One blacksmith at a point somewhere between Ligonier and Pittsburg will have reason to remember a hard ride in a Packard car. Wallie Owen had driven hard when he met with an accident and the Packard, belonging to a Pittsburg gentleman bound for Bedford, came along. Owen was offered assistance and at once started for the nearest mountain village to get a job done in blacksmithing. He carried back with him the smithy and carried him so fast over the water breaks that none of the occupants of the car ever found a chance to see whether the cushions were easy. In very fact, they were far above the seat the greater portion of the time. Owen repaired the break and forty miles later on it gave out. He went out Sunday and came in among the cheers of the contestants.

Sunburn was a serious matter with the contestants this year. At no other time did the sun cause like trouble. Faces became red, then started to swell and the face changed its appearance so that many could not be recognized. George M. Davis of the E. R. Thomas Motor Co. and many others suffered from sunburning and were in the hands of the doctors. The malady took on a serious aspect and caused untold agony in some instances. The doctors could not explain it, some explaining that bugs caused it and others that erysipelas developed. Whatever the cause, the beauty of many a man disappeared.

The neatest and best arranged reception along the route was at the old Firestone Homestead near Columbiana. Here the tourists were presented with a handsome basket filled with lunch. Every basket contained boxes of sandwiches, cigars of the finest kind and stone bottles of delicious milk. The ladies received handsome bouquets. The Messrs. Firestone, with their wives and many visiting ladies, presided over a tent filled with good things.

The reception to the tourists at Kokomo, where the Apperson Brothers presented lunches and small bottles and the Haynes Automobile Company supplied lunches from a patrol wagon which met the cars on the road, was appreciated by the tourists. The route was altered to take the tour past the Haynes factory, America's first automobile factory. This was done because Sales Manager Fanning made the request.

COLUMBIA ON ONE OF THE MANY HEARTBREAKING STRETCHES OF ALLEGED ROAD.

When the tourists stopped at Dayton at the big factory of the Dayton Motor Car Company, they were presented with lunches, were not allowed to pay for their gasoline and received a reception which warmed the cockles of the heart. The city turned out en masse and gave the visitors a royal reception. Sales Manager Jamison and Mr. Stoddard attended to all wants.

Mrs. Cuneo wore bands around her arms to strengthen the wrists and at Bedford Springs had armlets which drew much attention. The arms burned below and above the wrist bands and burned badly. Many commented on the fact and scores asked questions. The extent of the effects of the sun were plainly visible on Mrs. Cuneo's wrists.

**I**N contrast to previous A. A. A. tours, every competitor in this year's event was called upon to carry all the parts he considered necessary for the trip, and to obtain no parts from outside sources. During the stay at Bedford Springs, all competing cars were examined in order to verify the spares carried. Discrepancies between the manufacturers' list and the actual parts carried were discovered on certain machines, in some cases the parts being in excess of the list and in others parts being missing which, according to the list, should have been on the car. In all cases it appeared evident that the non-conformity between the list and the parts was due to hurried packing on the part of the manufacturer or to negligence of the drivers to verify the materials received.

As an official admission of the parts which, in the estimation of the manufacturer, might need replacing on the journey, the complete inventory holds considerable interest for those who are closely following the tour.

**OFFICIAL LIST OF EXTRA PARTS CARRIED.**

- Car No. 1—N. H. Van Sicklen—Apperson: Four roller bearings, 12 spark plugs, 1 commutator chain, 1 fan belt, 1 oiler belt.
- Car No. 2—K. R. Otis—Pierce Great Arrow: No extra parts.
- Car No. 3—R. D. Garden—Pierce Great Arrow: Four spark plugs, 1 carbureter float, 1 carbureter air valve complete, 1 unit coil.
- Car No. 4—H. A. Grant—Maxwell (non-contestant).
- Car No. 5—A. L. Kull—Dragon (non-starter).
- Car No. 6—T. J. Clark—Packard: One 714 hand brake ring, 1 796 clutch band assem., 1 1715 front spring, 1 647 foot-brake band shoe F.W., 1 647 1-4 foot-brake band shoe R.L., 1 647 1-2 foot-brake band shoe R.W., 1 647 3-8 foot-brake band shoe F.L., 1 647 5-8 foot-brake band shoe (Interm.), 2 1692 spark plugs.
- Car No. 7—A. R. Welch—Welch: One fan belt, 1 commutator complete, 1 pair valve arms, 1 exhaust valve complete, 4 spark plugs, 1 set brake lining and rivets, 2 spring clips and rivets, 1 bumper saddle and strap.
- Car No. 8—Chas. E. Finlay—Pierce Great Arrow (non-starter).
- Car No. 9—George S. Salzmann—Thomas Flyer: No extra parts.
- Car No. 10—F. J. Pardee—American Mors: One front spring, 1 rear side spring, 3 gasoline pipes, 4 never-skip spark plugs, 1 406 ball bearing, 1 508 ball bearing, 1 307 ball bearing, 1 309 ball bearing, 1 Whitney chain, 3 intake springs, 6 spark plugs, 3 exhaust springs, 2 valves, 4 nuts, 1 magneto, 2 magneto grease cups, 1 magneto gear, 1 magneto disk, 12 valve washers, 4 bolts.
- Car No. 11—Montgomery Hollowell—Thomas Flyer: No extra parts.
- Car No. 12—R. D. Chapin—Thomas Flyer: Two valves, 3 valve spring spools, 3 spring clips, 3 commutator wires, 3 universal joint bushings, 1 right front steering knuckle, 1 steering ball joint, 3 post springs, 1 spring repair, 1 spring clip bolt, 2 rocker arms, 1 front wheel inside bearing, 1 front spring bolt, 1 steering gear ball arm, 3 pet cocks, 1 commutator roller, 1 vibrator spring, 1 vibrator screw, 1 commutator contact, 1 carbureter spring.
- Car No. 13—Geo. M. Davis—Thomas Flyer (non-contestant).
- Car No. 14—Phillip S. Filinn—Pierce Great Arrow: Four spark plugs.
- Car No. 15—C. G. Cabanne—American Mors: One front spring, 1 rear side spring, 2 prs. Weed chains, 1 magneto, 4 valve springs, 4

- never-skip spark plugs, 1 H. B. bearing, 1 H. B. bearing, 1 H. B. bearing, 1 H. B. bearing, 1 Whitney chain, 4 spark plugs, 4 ignition hammers, 2 grease cups, 8 bus-bar bushings, 8 bus-bar nuts, 4 valves, 6 ignition springs, 4 gasoline pipes, 1 box extra parts.
- Car No. 16—Orrel A. Parker—Royal Tourist: No extra parts.
- Car No. 17—F. S. Dey—Pierce Great Arrow: No extra parts.
- Car No. 18—H. Paulman—Pierce Great Arrow: Non-starter.
- Car No. 19—G. S. Weldely—Premier: One spark coil unit, 1 set universal joint bushings, 1 outside front wheel cone, 1 inside front wheel cone, 1 storage battery.
- Car No. 20—John Kane Mills—Dragon: Non-starter.
- Car No. 21—Thos. P. Jones—Pierce Great Arrow: No extra parts.
- Car No. 22—H. H. Perkins—Packard: Four spark plugs.
- Car No. 23—H. C. Shoemaker—Shoemaker: One emergency spring repairer, 1-2 doz. cap screws, 1-2 doz. cap screws, 1-2 doz. cap screws, 1-2 doz. cap screws, 1-2 doz. cap screws, 4 spark plugs, 1-6 doz. grease cups, 1 fan belt, 2 spring bolts, 4 flat keys, 1 pr. tire grips, 1 clutch shifting finger, 2 clutch springs, 1 center plate for universal joint, 1 universal joint pin, 1 doz. assorted taper pins, 1 valve, 1 push rod and 1 roller and pln, 1 bearing, 1 brakeband, 1 cardan shaft.
- Car No. 24—W. M. Lewis—Mitchell: One carbureter, 1 commutator, 1 unit Splittorf coll, 1 pump coupling, 1 cardan shaft with universal joint, 4 grease cups for cardan shaft, 4 bushings for cardan shaft, 1 torsion rod block with rivet, 2 turn-buckles for rimbeads, 2 mushroom push rods, 2 oiler belts, 12 assorted split cotters, 12 assorted taper pins, 6 assorted cap screws with nuts, 12 assorted rivets.
- Car No. 25—Sid Black—Lozler: Two drive chains, 1 front spring, 2 clutch springs, 1 air valve, 1 spark coil, 1 doz. spark plugs, 2 oiler belts, 2 fan belts, 1 complete set wheel bearings.
- Car No. 26—Mrs. A. Cuneo—Rainier: One contact plug, 4 complete ignition plugs, 2 valve cocks, 1 front inside wheel cone, 1 inside front wheel ball roll, 1 outside front wheel cone, 1 outside ball roll, 1 outside rear wheel ball roll, 1 inside rear wheel ball roll, 1 inside rear wheel cone, 4 hose clamps, 1 front hub cap, 1 rear hub cap, 1 front spring, 1 rear spring, 4 spring clips, 5 lock nuts (front wheel), 4 lock nuts (rear wheel), 1 wire for magneto, 3 hose connections, 2 valves, 1 right knuckle, 1 left knuckle, 2 oiler chains, 1 steering drag rod, 1 pair oiler sprockets, 1 spring for stud, 1 rear hub lock and nut, 1 torsion rod spring, 5 sets of hammer igniters of 3 pieces each.
- Car No. 27—A. Kumpf—Pierce Great Arrow: No extra parts.
- Car No. 28—Paul Gaeth—Gaeth car: One oiler belt, 1 fan belt, 2 valves, 1 pinion shaft (ball race), 1 pinion shaft (cone), 1 set pinion shaft balls, 2 front wheel cones, 2 front wheel ball races, 1 set front wheel balls, 2 rear wheel cones, 2 rear wheel ball races, 1 set rear wheel balls, 1 front spring.
- Car No. 29—G. P. Moore—Welch car: One fan belt, commutator complete, 1 pr. valve arms, 1 exhaust valve complete, 4 spark plugs, spring mender, set brake lining and rivets, 2 spring clips and rivets, 1 bumper saddle and strap.
- Car No. 30—H. M. Coale—Autocar: Inlet valve cover, inlet valve assembly, exhaust valve assembly, rear axle, 2 oiler belts, clutch spring, 2 T roller bearings, 6 spark plugs, 1 fan belt, 2 inlet valve springs.
- Car No. 31—E. S. Lea—Walter: One brake band complete, 1 set foot brake connections, 2 complete hub connecting rods, 3 spring clips, 1 valve case, 1 valve nut, 1 exhaust lifter complete, 1 inlet lifter complete, 1 hub cap, 1 belt for brake band, 3 rubber connections, 1 set of brass bushings for driving shaft, 1 box of assorted bolts and nuts, 16 spark plugs, 30 gaskets, 2 oil pipes, 1 rubber bumper, 1 lot of wire, 1 set of spiral springs, 1 complete rocker arm, 1 clutch collar, 2 extra valves, 2 coll units, 2 thrust washers, 2 fan belts, 1 Universal cross, 1 timer, 4 valve cap washers.
- Car No. 32—W. J. Howard—Oldsmobile "A": No extra parts.
- Car No. 33—R. M. Owen—Reo: Oiler pipe, auto jack, hammer, master links extra, 1 chain, transmission brake band, ball end, distance rod end, push rod, 1 valve, rear wheel key, rear wheel pin, high speed cone, filler plug, carbureter oil, shut-off for gasoline, box friction tape, 2 bolts for hood to dash, 2 high-speed dogs, clamping screw high-speed spider, starting ratchet and pin.
- Car No. 34—R. L. Lockwood—Reo: Extra parts same as No. 33.
- Car No. 35—Geo. L. Lyon—Reo: Extra parts same as No. 33.
- Car No. 36—E. B. Finch—Pungs-Finch: Two valve stems, 2 fan spindles, 1 pump, transmission shaft, brake band.
- Car No. 37—A. L. Peterson—Meteor: Three springs, 2 valves, 2 spring clips.
- Car No. 38—H. C. Tillottson—Stoddard-Dayton: Leather valve for carbureter, 2 front wheel bearings, 2 rear wheel bearings, 8 wheel lock washers, coil unit, 2 valve caps, 1 push rod adjust screws, fan belt, carbureter, 2 spark plugs.
- Car No. 39—Arthur N. Jervis—Berliet: Four spark plugs, ignition rod, 4 igniter contact levers, 7 igniter outside levers, 8 ignition lever springs, 2 igniter plate gaskets.
- Car No. 40—R. H. Johnston—White: Non-contestant.
- Car No. 41—I. C. Kirkham—Maxwell: Front spring, rear spring, inside ball race, outside ball race, steering knuckle (right), steering

knuckle (left), 2 valves, drive pinion shaft yoke, drive shaft yoke, 2 yoke pins, inlet spring, exhaust spring, drive pinion grease cup, 2 commutator arms complete, 2 spark plugs.

Car No. 42—R. H. Tucker—Royal Tourist; No extra parts.

Car No. 43—J. W. Mears—Acme car: Two sprocket shafts, 2 compensating shafts, 2 con. rod brasses, 1 steering knuckle, 1 steering knuckle arm, 1 driving chain, 2 emergency brake bands, 1 magneto switch, 1 magneto circuit breaker, clutch spring, 2 sets T wheel bearings, 1 complete set of gear shafts and bearing transmissions.

Car No. 44—Gus G. Buse—Packard: Six spark plugs, 4 valve stem keys, 2 valve springs, magneto chain, magneto carbon, spring clip, universal joint cover, governor diaphragm cover (rubber), governor diaphragm cover (leather), 1 foot hose for wster line.

Car No. 45—A. M. Robbins—Aerocar: One valve spring, 12 spark plugs.

Car No. 46—Geo. F. Barr—Aerocar: Two valve springs, 12 spark plugs.

Car No. 47—Walter C. White—White: No extra parts.

Car No. 48—A. J. Scaife—White: No extra parts.

Car No. 49—Chas. H. Burman—Peerless: Two spark plugs, pr. external brakes, 2 universal couplings, live driving shaft, rear wheel clutch plate, 2 spring clips and 5 spring bolts, rear hub cap, air valve, 5 fan belts, 6 R.B.F. annular ball bearings, 4 brake rods, brace for crankcase, 2 water jacket gaskets, 3 pieces 1x1-4 inch hose, inside rear hub, outside rear hub, front drive pinion, rear drive pinion, differential, differential.

Car No. 50—W. C. Straub—Peerless: Pr. external brakes, 2 universal couplings, live drive shaft, rear wheel clutch plate, 2 spring clips and five bolts, rear hub cap, air valve, 2 Timken roller bearings, 6 R.B.F. ball bearings (inside, outside, thrust drive, rear drive, differential, differential), 4 brake rods, 3 water hose connections, 2 spark plugs.

Car No. 51—J. H. Becker—Elmore: Two steering knuckles, 4 cones, 6 ball bearings, 1 bypass screen, 4 cylinder rings, timer, timer clamp, coil unit, 2 trans. brake shoes, 4 universal joint bushings, emergency brake lever dog, 2 Sager equalizing springs.

Car No. 52—Wm. G. Houck—Deere: Two valves, 2 valve springs, 8 spark plugs.

Car No. 53—Deere-Clark Motor Car Co.—Deere: Non-starter.

Car No. 54—Edward Noble—Haynes: Two valve springs, 2 universal joint pins, 3 fan belts, 2 oil pump valves, 2 roller bearings, grease cup, 2 spark plugs, 2 spring shackles, carbureter air valve, 2 rollers for pinion, 4 valve plug washers.

Car No. 55—F. N. Nutt—Haynes: One valve, 2 fan belts, 3 valve springs, 2 oil pump valves, roller bearing complete for front wheel, 1 grease cup, 4 spark plugs, 6 valve plug gaskets, carbureter air valve, 2 rollers for pinion, 2 universal joint pins, 2 spring shackle bolts.

Car No. 56—F. E. Dayton—Columbia: No extra parts.

Car No. 57—A. D. Cressler—Thomas Flyer: Non-contestant; from Chicago to Indianapolis only.

Car No. 58—Lucius S. Tyler—Maxwell: Front springs, rear springs, 6 spark plugs, set external brake sheaves, universal yokes, 2 universal yoke pins, inside ball race, outside ball race, dust ring, felt washer for dust ring, 2 inside cones, 2 outside cones, valve, fan belt, 2 inlet valve springs, 1 exhaust valve spring, 2 spring clips, pr. commutator arms complete with spring.

Car No. 59—Chas. A. Fleming—Maxwell: Front spring, rear spring, drive pinion support, 2 sets brake shoes, right steering knuckle and left, fan belt, spark coil units (2), 14 spark plugs, 2 grease cups, 2 inside ball races, 2 outside ball races, 2 pet cocks, 2 spring

clips, grease cup cover, drive yoke, universal yoke pin, 4 inside front wheel cones, 4 outside front wheel cones, 4 valve springs.

Car No. 60—Wm. Turner—Thomas Flyer: Non-contestant.

Car No. 61—H. G. Smith—White: Non-contestant.

Car No. 100—A. E. Hughes—Pierce Runabout: Carbureter air valve, carbureter air valve spool, carbureter air valve spool nut, carbureter air valve spring, seat air valve, 2 interior brake shoe springs, fan belt.

Car No. 101—C. A. Coey—Thomas Flyer: Non-starter.

Car No. 102—H. E. Coffin—Thomas Flyer: Two valves, valve spring, 4 universal joint bushings, 3 clutch toe springs 3 spring clips, 2 commutator wires, 2 coil adjusting screws, left front spindle, valve stem spools (2), 2 rocker arms, inside front wheel bearing, front spring bolt, spring clip bolt, 3 compression relief cocks, 1 pet cock (brass).

Car No. 103—H. O. Smith—Premier: One spark coil unit, set universal joint bushings, outside front wheel cones, inside front wheel cone, storage battery.

Car No. 104—G. S. Smith—Stoddard-Dayton: Leather valve for carbureter, front wheel bearing, rear wheel bearing, 8 lock washers, 1 coil unit, 2 valve caps, push rod adjusting screw, fan belt, carbureter, 2 spark plugs, driving pinion.

Car No. 106—J. C. Zimmerman—Locomobile: Non-contestant.

Car No. 106—R. G. Kelsey—Matheson: Two extra spring shackles, 1 ignition plug hammer, 1 ignition plug anvil, 2 rocker arms, 4 plug gaskets, 1 set (2) Timken roller bearings.

Car No. 107—Harry G. Stutz—Marion: One pin and shaft, 1 transmission shaft assembled, 1 right hand front knuckle, 1 left hand front knuckle, 1 coil unit, 4 spark plugs, 1 Schebler carbureter, 1 Herz timer.

Car No. 108—H. K. Sheridan—White: No extra parts.

Car No. 109—C. S. Johnston—Continental: Two extra springs, 2 spring clips, 2 shackles, leather belting, 1/2 doz. assorted bolts, 4 spark plugs, 3 pet cocks, lot of assorted bolts, starting crank handle, 2 brake bands.

Car No. 110—A. B. Tucker—Dragon: Non-starter.

Car No. 111—W. Owen—Pennsylvania: Three valves, 1 coil, 1 carbureter, 6 spark plugs, roller bearings for two wheels.

Car No. 112—J. W. Haynes—Dragon: Two fan belts, 2 valves, 2 springs, 2 spring cups, 2 spring cup keys, 1 commutator, 1 clutch, leather and rivets, 1 set Timken bearings complete, 1 oiler gear on shaft, 1 fiber oiler gear, 2 full sets gaskets for engine, 4 spark plugs, 2 rollers for clutch shaft, 2 roller pins for clutch shaft, 4 Hyatt roller bearings, 2 thrust bearings, 1 propeller shaft bearing (long), 1 propeller shaft bearing (small), 1 box assorted cotter keys and taper pins, 1 box lock and flat washers assorted, 1 box assorted bolts, nuts, machine bolts and studs, 3 feet hose, 2 connecting rod bearings, 1 piston pin, 1 piston pin bushing, 4 vibration springs for coils, 4 contact points for coils.

Car No. 113—H. P. Branstetter—Dragon: Same list of extra parts as for car 112.

Car No. 114—James G. Barclay—Thomas: Two valves, 3 valve-spring spools, 3 spring clips, 3 com. wires, 3 universal joint bushings, 1 right front steering knuckle, 1 steering ball joint, 3 toe-springs, 1 spring repair, 1 spring clip bolt, 2 rocker arms, 1 front wheel inside bearing, 1 front spring bolt, 1 steering gear ball arm, 3 pet cocks, 1 commutator roller, 1 vibrator spring, 1 vibrator screw, 1 commutator contact, 1 carbureter spring, 1 main shaft for trans., 1 trans. yoke.

Car No. 115—Wm. Badger—Cleveland: One front spring, 1 set ignition parts.

## SEEN AND HEARD ALONG THE ROUTE.

ONE fact is self-evident—there's always a grumble on conditions for contests of any sort. The New Jersey Automobile and Motor Club's 600-mile run, the Long Island Automobile Club's three-day run, the Automobile Club of America's 600-mile sealed-bonnet contest, all were far too easy to be a real test of cars, and the New York Motor Club contest was simply a rank failure because it was too hard, and cars could not be expected to make perfect scores. The Fourth Annual of the American Automobile Association was harder than last year. It was a real test of cars and drivers, but according to some it was too hard, these "some" being in the contest, while to many who did not enter it was not hard enough to try out cars. "Too hard" said one, "Too easy" said another, and all have advice to offer as to how a tour should be run, while few will ever take the time to draw up their conclusions and put them in writing, so that committees may consider them.

Stone throwing and ilke troubles nearly caused accidents. Spectators who watched the tour pass seemed to think that the tourists were immune from trouble. Notes wrapped with a stone in paper were pitched into the cars by young girls, and boys threw stones in mischief and without thoughts of danger to the contestants. In one instance a woman threw a wet dish cloth and apples were thrown by kindly minded persons. These pres-

ents and missiles, for they were such in many instances, caused untold agony when they struck the tourists, and in several instances came very near causing trouble through striking the driver.

Since the trip of the Greater Arrow in pathfinding, the roads from Pittsburg to Ligonier had been so improved that time was made in the first half of the Pittsburg to Bedford Springs journey, which allowed a leeway of hours for the latter half of the trip. The eight and one-half hour schedule was considered far too fast when made, but proved an hour too slow for an average on the time made by the cars.

In front of the Auditorium Annex two negroes passing stopped to look and one said to the other: "None but millionaires ride in automobiles." Some of the tourists rather swelled at that, including some newspaper men, and backs became straight, while some felt of their pocketbooks and wondered where the million was going to be found.

The officials required four people in every touring car, but some did not have four all the time, as the water breaks kept at least two in the air most of the time. A few learned to ride the bumps safely by standing, but others took their innings and became rubber balls.

# Classification and Elimination of Speeding

By  
A.  
N.  
Jervis

**N**EXT in emphatic persistence to the impression of the utter crudeness of American roads is that of the wonderful stage of efficiency and reliability to which the automobile has been brought, that it should pound and bounce over them or plow through them day after day for thousands of miles.

The locomotive, on its costly special roadbed and steel guiding rails, is driven along, nursed and cared for constantly by an engineer who knows the machine as a mother does her child, and under all these favoring circumstances the locomotive is not required to go out day after day. It is given a run of 100 miles one day and given a rest the next, being thus relayed all the time. Something in the neighborhood of fourteen locomotives are used to haul the fast trains between New York and Chicago. Yet the lighter and more delicate engine machinery of the automobile is taken out on the trackless trails called roads and bumped along day after day and expected to keep in good running condition without even being cleaned up and attended to over night.

Simply because men demanded it, some cars have been built that will do this, and now it is exacted of them all. It is unreasonable, but competition in the open market compels, and therefore, as an advertisement of the touring qualities of their cars, nothing can be better for the makers than one of these competitive tours if it is sensibly, ably and equitably conducted.

## The Old Tale of the Survival of the Fittest.

What the public wants to know about the cars is how much trouble and expense they involve on a long tour. Those who buy cars or are contemplating purchases are entitled to this information when a competitive tour is arranged by a non-commercial organization, of which they are members, such as the A. A. A. What the tour reveals regarding the various cars should be given to the public honestly. There is everything to gain in this. Actions speak louder than words and the performance of a car in a well-regulated touring contest will go further toward establishing a lasting reputation than unlimited shouting and reams of printed argument. The good will stand and the flimsy will fall, and this is what every honest manufacturer wants—to stand or fall on the merits of his product and to see the fit survive while the weak are exterminated. This is certain to happen, whether contests which bring out the weaknesses are run or not, for in no industrial manufacture does the law of fittest survival apply more rigidly. It is fair to assume that every maker is striving to meet the competitive conditions and produce a car that for efficiency and reliability is worth its price, whatever that price is. Those who expect to continue in business must do this. In no other line is it such arrant business folly to build a clap trap article to sell quickly. The maker of such a product in automobiles can have but a very short career. Considering these points, why should not all be willing to see competitive tours run on the

strictest basis of honesty and frankness, without any advertising faking whatever? It is acknowledged that the manufacturers have much to learn before cars will be perfect. They benefit by the instruction, as well as the buying public. It does not spell ruin to have derangements and breakages occur while cars are being put through a strenuous run. That portion of the public which buys automobiles is intelligent and reasonable in the main. They do not expect a car to make long tours over wretched roads without any care or repair or adjustment. They do not expect an \$800 car to make as good a schedule run and to give as little trouble as an \$8,000 car. They know that what a car may do, or fail to do, on one day or one tour, it will not on another. They know that the record of one trip is not the final word as to the merits of a car. It is probable they are less fooled by the misleading reports given out than is supposed. They are too reasonable to suppose that the \$800 car is equal in all ways to the \$8,000 car, just because the rules of some contest permits both to make a perfect score. They do not expect a watch, or a bicycle, a horse and carriage, or a kitchen range to work without regulation and repair, neither do they expect to get as good a diamond for \$50 as for \$500, although they know that a genuine diamond can be bought at the lower figure. It is fatal to try and build up a business in any way that involves fooling the public. Therefore, it is time that all the fog should be driven away from these touring contests. The present one has shown that they can be made of value to both the public and the manufacturer. It is nearer what such an affair should be than any predecessor, although far from being right yet.

## Big and Little, All Are Expected to Do the Same.

It is at once too strenuous in some conditions and too lax in others. It is beyond every conception of equity to have cars of all sizes, weights, horsepower and prices competing on equal terms. To those who merely read the reports in the papers one cannot tell but what every car not penalized went through the day or the tour with equal facility. Only those on the tour know the troubles of many that barely pull through and the ease with which others perform the task set. This amounts to misrepresentation and is wrong, because it is a fact that the public is so wise that it is coming to put no faith in the apparent teachings of such events. They know it cannot be true that all these cars of different sorts are equally good performers. They want the truth. The man who cannot afford to pay more than \$2,000 for a car does not expect it to climb mountains and run as fast and be as little trouble and to give as much comfort and last as long as one costing \$6,000. What he does want to know is about how much trouble and expense this or that car is on a long trip and what sort of a time schedule it can reasonably live up to.

To furnish this information the conditions of a contest should be the same in essentials as those of a pleasure tour, but just a bit more strenuous and exacting.

The first thing fundamentally wrong is to frame up rules so that a premium is placed upon speeding, with a time limit as to early arrivals. In all these tours the participants have been encouraged to "beat it" to the night stop, although there is a penalty for being there too early, or, to be precise, for "checking in" too early. Could anything be more ridiculous? The penalty for arriving ahead of time was originally designed to prevent speeding, but the rule of not making any allowance for time spent in making repairs to tires, or cars, for lunching, or for any unavoidable delays, has always induced the drivers to keep as much as possible ahead of schedule in order to have time to spare for unexpected delays. In consequence, the majority arrive at the end of the day's run far ahead of time and then have to stand in the

R. G. KELSEY'S MATHESON ON THE WOOD-SKIRTED HIGHWAY.

ROYAL TOURIST IN COOL SHADOWS OF THE ROADSIDE.

sun or rain till the time for checking in. Could anything be more farcical or more contrary to normal touring conditions?

The pleasure tourist who expects to dine at a certain time and place, if delayed by punctures or other troubles will make up some part of the time, perhaps, but he will not endanger his car and his life to be there at that time, as men have done on the present tour. The rule requiring all lost time to be made up is wrong in every way. It is the one that compels speeding and it is the one that gives out a false impression of merit, because under it a car may be penalized when its running qualities were not at all in fault. Stops should be deducted and a record of them kept, along with every repair and adjustment made.

#### Elaborate Arrangements Would Be Justified.

Observers would be necessary, of course. It is said that it is difficult to get honest observers. Well, it is difficult to regulate honesty under any conditions. There is certain to be a percentage of deception, as there is under the present rules, and the employment of observers would certainly decrease it.

Some incidental racing to be first at the finish is almost unavoidable under any conditions, although the system adopted on this tour of issuing numbers of the starting order to the cars and having a pacemaker whom none may pass has worked very well. This could be modified so that cars could check in on arrival and not have to stand foolishly waiting for their time.

With the cars in classes there would be a pacemaker for each division, of course, and the whole arrangement would be elaborate, but what is worth doing is worth doing well, and one good competitive tour that would really bring out the truth of respective merit, as they have been supposed to do, would seem to be worth while. If a man was to be allowed the time consumed at lunch,

in repairing and in all stops, he would be foolish to risk his chances of lasting two weeks by fast driving. A fairly lively schedule could be made and those who chose to "beat it" might be allowed to do so, for there are wise tourists and foolish ones, but every inducement for "beating it" should be removed. One control a half hour or hour from the finish could be arranged.

An immense amount of detail will be necessary to work out a satisfactory touring contest, but it would appear to be worth while, for with a proper set of rules, that would let every car stand on its merit, it would be "good business" for every maker who really believes in his product to enter several cars. Those that made good would be vindicated and the honest makers of those cars that failed to make good would learn what they wanted to know—their weak points.

#### WILL THE FARMER INSIST UPON SPEED HIMSELF

"We read in a newspaper that a large manufacturing company is about to engage in building family automobiles for the farmers, but designed for room and ease for the farmer's family rather than for speed," says the *Delaware State News*. "Well, we never saw a genuine farmer yet who would buy an auto that hadn't speed and couldn't just split the air. The farmer now howls at the speed of the auto sports because he must take their dust and insolence. But if he had a machine himself he would undoubtedly let her whiz. Unless his old hoss is well on the road to the graveyard, a farmer will not permit another farmer to drive by him on the road now without a sprint. He is up on his high speed mettle all the time and prides himself on cleaning out any kind of a road race, as much as a school girl glories in being the belle of the school."

HAY MOTOR DRIVERS WATCHING THEIR RIVALS AT THE WHEELS OF THE "BENZINE BUGGIES."

# The Details of the Days' Runs

ARE there any roads in the United States away by main strength over every foot timore on primeval cowtracks and through sharp declivities and hurtling down them their spinal columns over endless water—has come to the decision that there are not. human endurance on one side and artither, days become whole epochs in the that springs eternal that each one battles daily endeavor, and it is with a heaven-sent feeling of relief that each one draws up at the finish and receives his formal release—another day nearer the coveted goal. And this for the everlasting honor and glory of the American automobile and its builder, who has demonstrated that no conditions are too severe, no test too gruelling to be overcome with credit to itself by the fabric of iron and steel he has produced. Some day we shall have many miles or real roads. There's might in the automobile's growing army.

that deserve the name? Since fighting their of the distance between Chicago and Balveritable sloughs of despond, climbing to the imminent danger of dislocating breaks—each and every one of the tourists In the struggle between mechanical and ficially aggravated natural obstacles on the lives of the tourists. It is with the hope forth to perform his strenuous round of

## WHAT HAPPENED ON THE SIXTH DAY

COLUMBUS, O., July 17.—There was some excellent going on this day, despite the fact that the rain of the previous night had raised some havoc with the surface of the Old National Highway, which figured for 106 of the 174.2 miles that constituted the allotted task. A thunderstorm soon after the start drenched the tourists, and the ruts, full of water, supplied a musical splash that made the traveling somewhat skiddy. At Greenfield, twenty miles, traps were said to exist, and so the procession poked its way through town, cautiously and with due respect to the law. Just about this time Old Sol's ruddy face came through the clouds, and the day took on a new aspect, and life was again worth living.

Cordiality and hand waves and flags marked the tour's pathway, and occasionally a bouquet found its way into a car, thrown by a rosy-cheeked lass who often supplied her name for a souvenir postcard. Lewisville enforced the speed limit vigorously, and there seemed a slight hesitancy in the greetings of tourist and onlooker. In other towns there was manifest great disappointment that the pace was not more rapid, and one small boy summed it up when he contemptuously said: "Why, I see 'em go faster every day than you fellers!"

At Dunreith a sign told that the new Maxwell-Briscoe factory was only ten miles away at New Castle. "Come over and see us!" was the invitation, but unfortunately we didn't have time.

Beyond Westville the Indiana barefoot boys and girls—some of the latter of pretty good size—were replaced for more shoeless boys and girls of Ohio. Freckles bedecked their countenances just the same, and sunbonnets and red calico dresses continued stylish in the villages and the country. The scent of new mown hay seemed equally sweet and the harvesting of acres of wheat and oats was moving apace. The country looked prosperous, and the farmers and their families welcomed the passing of the autos in holiday mood and with enjoyment.

At Dayton we bade adieu to the National Highway, said hello at the Stoddard-Dayton factory, got gasoline and lunch for nothing, and continued on our way rejoicing. Just as we entered the lively town the Speedwell Motor Car Company had thrust baskets of thirst quenchers into our cars.

Springfield's wideawake automobile club did a kindly act when it told us to beware of the water bars encountered soon after leaving the town, denoting the nightmares of road building by little red flags. The road, however, didn't prove half bad until we were within a dozen miles of Columbus, when it turned into a rutty road with all sorts and kinds of holes, and we bumped along until the welcome brick pavement was struck at the city's limits. The Columbus Automobile Club entertained in the evening at its headquarters in the Hotel Hartmann.

### Steady, Regular Running Was Required.

Over the 174 miles of road between Indianapolis and Columbus few mechanical troubles made themselves visible. Nothing more was required of the machines than steady, regular running for nine hours and nearly all responded to the call. The exceptions were No. 24, Mitchell, which lost a little time on the road owing to ignition trouble, but which would have still reached control on time had not a puncture occurred during the last fifteen miles. A plucky attempt was made to get in on time by driving into Columbus at top speed, but it was then too late to make up the loss and 98 points penalization awaited the car.

With one exception all the Hower runabouts finished the day's run with perfect scores. C. S. Johnston, the owner of No. 109

Continental, was the unfortunate. At Richmond an officious policeman detained the driver for several hours. Misfortune still tracked the Hower contestant, this time a collision with a trolley at Dayton. Mr. Johnston, realizing his chances destroyed, retired.

MODERN TYPES OF CONVEYANCE AT THE INDIANA-OHIO STATE LINE.

## THE SEVENTH DAY ARRIVAL AT CANTON

CANTON, O., July 18.—This figured as an eventful day in the history of the tour. There was as poor going getting out of Columbus as there was reaching its hospitable precincts. "Spaghetti Chief" Lewis went astray at Frazeyburg, some 55 miles onward, and the Maxwell and Premier climbed a mountain and climbed down again—some seven miles of the toughest sort of wasted effort—and before the error was corrected several cars, including that of Chairman Hower, had followed suit. Beyond Port Washington there is an abrupt turn with a bridge that jumps over the canal, and here several had to employ skill to avoid accident. One came to grief.

An average country road extended to Massillon, where the Jewel is made and where the most hospitable Cantonians first gave greeting to the visitors.

"Come in, the town is fine. It is yours."

That tells the story which was to conclude early the following

up an embankment and ditched. No. 90 Packard press car was close behind with disabled Deere No. 52 in tow, and the combined crew soon placed the Meteor on the road again, uninjured.

The worst accident of the day was that which befell W. G. Houck's Deere car No. 52. Near Port Washington the steering gear snapped, causing the automobile to shoot over the embankment into the canal. When the car was put on the road again it was found that the engine and transmission were intact, but that the steering apparatus was hopelessly disabled. Tom Fetch, who came along with Packard press car No. 90, rigged up a temporary steering control of an exceptionally ingenious nature. The emergency brake lever was dismantled and attached to a tire tool mounted in makeshift bearings across the fore end of the running board and secured to the connecting link. No tools or part not carried on the car were used for this clever piece of work. Two men were needed to operate

CARS PARKED FOR THE NIGHT ROUND THE SOLDIERS' MONUMENT AT INDIANAPOLIS.

morning when on the outskirts of the attractive little city a banner was to read:

"Good-bye! Good Luck! Here's to the Winners."

Mayor Turnbull, Committeemen F. C. McLain, H. A. Croxton and associates met Chairman Hower and gave to him the key of the city. Lakeside Park was open to the dust-grimed company, which was specially entertained at the Country Club across the lake, with His Honor, the Mayor, acting as the director of ceremonies.

### How the Unlucky Ones Suffered.

The road surface for the day was never very heavy and was everywhere dry, yet there was such a succession of ruts and breakers, difficult grades and dangerous turns that it was impossible once time had been lost to again make good.

Early in the day A. M. Robbins, driving Aerocar No. 45, withdrew from the contest with a broken clutch. His previous record had been a clean score all along the line.

Meteor No. 37, entered and driven by A. L. Peterson, suffered from a leaky radiator, which on the hilly road made it impossible to continue. On a quiet lane the radiator was dismantled, the soldering iron heated at a nearby cottage and the leaks soldered up. A couple of hours later the car missed a sharp turn, ran

the car, one on the running board to steer and another to control the engine and change gears. For a mile the Deere was towed by the Packard, but when it was found that the steering gear acted satisfactorily, the tow rope was cast off and the machine brought in under its own power.

No. 31 Walter, entered by E. S. Lea, after a sharp turn off a bridge, shot over an embankment, a drop of about ten feet, without suffering any injury. Put on the road, it was in such good condition that it got into the control on time.

No. 43 Acme entered Canton with a loss of 42 points, the hard going having caused a bit of trouble in the rear axle. Gus G. Buse, who had retained a clean score up to this point, and looked upon as one of Buffalo's best representatives, suffered to the extent of 91 points. About sixty miles from home he passed the writer, who at the time was jogging along easily in the White non-contestant, driving at a very rapid rate. According to a rough calculation, he was making a last desperate attempt to reach control by racing over the rough roads. As we were the last on the road and had taken careful note of all lame contestants, the report that Gus G. Buse lost time through missing the trail in Coshocton appears to be correct. All the Hower runabouts—seven of them being still in the running—finished with perfect scores.

[TOURISTS THE CENTER OF POPULAR INTEREST AT COLUMBUS.]

CANTON'S SHADED STREETS PRESENTED A SCENE OF ANIMATION.

## EIGHTH DAY THE HARDEST OF THE TOUR

PITTSBURG, PA., July 19.—Enthusiasm galore greeted the arrival in this smoked hustler of American cities, but the ride from Canton—just under a century in distance—was the hardest run of the tour, and the schedule of six hours compelled some fast and skilful driving, especially during the route through Allegheny and Pittsburg right up to the entrance of the Hotel Schenley. But the mayor had prepared for the unusual occasion and police lined the streets and held back the thousands who shouted and waved as the smut-faced drivers and passengers whirled along at speed never before allowed in this city.

For the greater part of the way from Canton the going was simply frightful. Near Columbiana the "Firestone Homestead," a summer outing place of the Firestone Tire Company, the most palatable sort of a lunch was handed to the flying squadron as it temporarily stopped in its rocky progress.

But the worst section of the journey came in getting into Allegheny. At Freedom, some thirty miles out, "Phil" Flinn induced a change of route in reaching his native city, and there are some who believe the book would supply the better going. It is safe guessing that any route into Pittsburg is pretty bad, and it is a fact that the one followed figured as the worst stretch of road of the tour.

At the Schenley there were good accommodations, and the Pittsburg Automobile Club added to the festivities by a band for the afternoon and evening. President Kneeland, Secretary Paul C. Wolff, Dr. J. A. Hawkins and other club members were much in evidence, for few of the tourists had the ambition to accept the club's kindly invitation to call at its downtown headquarters.

Six clean score Gliddenites and one clean score runabout failed to make the schedule time of six hours. Altogether ten touring

cars and two runabouts had penalizations placed against them on the eighth day's running, proving that the test was the most severe of any to which the cars had been put. Had not the police of Allegheny lent that valuable aid and Grand Boulevard been opened for a fast final spurt several others would have been unable to accomplish the run on the very restricted time allowance.

### Those That Were Unlucky and Met Penalizations.

F. J. Pardee, driving American Mors No. 10 for clean certificate only, lost his chance of victory through tire trouble; his wild dash over the last ten miles failing to bring him to the checker's line when he was clocked to report in. "Sid" Black, piloting Lozier No. 25, arrived with a time penalization of 57 points. For a couple of days he had been struggling with his front springs, one of which had broken as early as the Chicago-South Bend stage. When both smashed it was impossible to maintain the strenuous pace any longer.

Mrs. Cuneo, who commanded much attention all along the tour, had eight points placed against her for her late arrival, due to the breaking of one of the front springs of her Rainier No. 26. Gaeth No. 28, driven by Paul Gaeth, lost time on the road principally on tires and had his perfect record destroyed by a penalization of three points. No. 37 Meteor arrived very late, having had further trouble with a leaky radiator. On a previous day the starting lever had been bent in such a way that whenever the motor was cranked the lever bore upon the lower part of the radiator and broke away the tubes.

The little Maxwell No. 41 also tarnished a clean score by a time penalty of 37 points. Acme No. 43 reached control with a loss of 27 minutes as the result of a weakened rear axle.

THE APPROACH TO PITTSBURG WAS VERY PICTURESQUE.

DAY OFF AMONG THE SUMMER MAIDS AT BEDFORD SPRINGS.

Another of the perfect score men to meet with misfortune was F. N. Nutt, driving No. 55 Haynes, with a penalization of two points for late arrival. No. 58 Maxwell, a machine with a previous good record, lost three points, also for late arrival.

Among the contenders for the Hower runabout trophy John Haynes, driving Dragon No. 112, was the most serious suffered.

The fan pulley sheared off when the car was ahead of its schedule, necessitating a repair of such a lengthy nature that there was little chance of reaching control on time. Later a blow-out, while traveling at a rapid rate, placed the Dragon hopelessly in the rear. H. E. Coffin's Thomas Forty No. 102 received its first penalization for late arrival, the loss being 77 points. The White and Stoddard-Dayton were comfortably on time.

## NINTH DAY THE ALLEGHENIES WERE CLIMBED

**B**EDFORD SPRINGS, PA., July 20.—Out of the deceptive haze of the Smoky City the dirt-caked and bedraggled procession this morning emerged, and, truth to tell, had they been on horseback instead of in autos they might with few exceptions have been taken for present-day Coxeyites. The other afternoon, while viewing the passing through Massillon, "General" Coxey is said to have remarked that the autoists gave his former "army" a close call in appearances.

Through Wilksburg and and then winding down into Turtle Creek, in and out of Wilmerding, and next East McKeesport and the Greensburg pike began. The pall of soot seemed to be thinning and there were patches of light in the sky. Twenty miles there were occasional bits of climbing, and the tourists expressed delight at finding that the water bars were being lessened in number by laborers who worked sturdily. It was learned later that Congressman George F. Huff of Westmoreland county was the man who had given the final word that resulted in lessening these cuss-word producers. Greensburg is the Congressman's home and it is a smart city and thoroughly up-to-date.

It is up and down to Youngstown, and a couple of miles beyond the route paralleled Loyalhanna river, the valley rich in foliage and deliciously cool. The climb of the Chestnut Ridge wasn't hardly worth talking about, and the worst encountered came in the way of a soft spot on the level road near Ligonier. A rough clay hill, next Laughlinstown, and then the string of panting autos tackled the four-mile dig up Laurel Ridge. Rain threatened and at the top a fog enveloped the summit and shut out the picturesque views possible in all directions on a clear day. A coast of two and a half miles down to Jennerstown caused some burning of brakes.

Stoyestown lies at the base of the Alleghenies, and 'tis an upward journey, with occasional variations of downward dips, to the summit, near which is Buckstown, where the farmers for miles around were picnicking for the day, drawn thither by the

passing of the autoists. Sunshine broke forth and the eight-mile coast to the foot disclosed scenic beauties in profusion. Of course, the water bars had kept everybody bouncing about and cussing, and some of the inexperienced mountain drivers did more or less damage to their weakened cars.

'Tis an attractive spot, this Bedford Springs Hotel, where a rest is scheduled for over Sunday, and Manager Wing exerted himself to the utmost to provide for the autoing army, despite the already crowded condition of the well-conducted hostelry.

### Some Penalization Came in the Crossing.

With but very few exceptions the sufferers on the ninety-seven miles of mountain climbing were those whose machines had been weakened on previous stages. Columbia No. 56 stripped all gears but the high and was unable to make the journey. Meteor No. 37, after making arrangements to solder the leaky radiator when the motor had been cranked, and cover the distance without stopping the engine, entered into collision with a trolley car and was obliged to remain in the neighborhood of the Smoky City until next day, arriving at Bedford on Sunday night.

Deere car No. 51 was patched up for the run and reached Bedford Springs in a tottering condition, stripping the intermediate gear on the way. To bring it over the mountains after the injuries it received through falling into the canal was a remarkably plucky performance on the part of the driver.

Acme No. 43 stayed behind several hours to repair a damaged rear axle, being heavily penalized for late arrival. Despite his bad position and weakened axle, J. W. Mears declared he would continue as a contestant.

T. P. Jones, driving Pierce No. 21, after a nine days perfect performance, trailed in late and incurred a time penalization of 90 points. The delay was caused by five punctures and two blow-outs and by Mr. Jones' young son being thrown out of the tonneau and having to be attended to by a doctor. This penalization spoiled

WHERE THE LONG ROW OF DUSTY CARS WERE GARAGED OVER SUNDAY IN THE FIELD AT BEDFORD SPRINGS.

BURMAN (PEERLESS) TACKLING 1863 WATER BREAKS OR "THANK-YOU-MA'AMS" THAT CORRUGATE PENNSYLVANIA ROADS.

the Pittsburg club's clean Glidden score and placed Buffalo in lead.

Mrs. Cuneo had been delayed on the run to Pittsburg by a broken front spring, which called for further attention before Bedford Springs was reached. For the last few miles, where speed was possible, the lady driver made a bold dash for home and was rewarded by a rousing cheer from those gathered in the hotel grounds. The inexorable checker, however, marked down three points for late arrival.

When everybody at Bedford Springs had retired for a well-earned rest, Mitchell No. 24 slipped into the ground, unofficially checked of course. Both front springs being broken, the run over the mountains had been a run in name only. W. M. Lewis announced that he desired to continue as a contestant and insisted he would complete the tour at any rate.

Hower trophy contestants suffered heavily during the day. A. E. Hughes, with clean-score Pierce No. 100, had a series of tire troubles and a few mechanical difficulties, which caused him to arrive with a time penalization of six points.

H. E. Coffin, on Thomas "40" No. 102, when trying to pass a touring car at high speed outside Pittsburg, went into the ditch and broke the front spring.

H. O. Smith's Premier No. 104, with a clean score at Pittsburg, was unable to continue owing to the driver, Harry Hammond, falling ill and no substitute being available.

Up on the mountains, miles from any village, Wallace Owen was stranded with his Pennsylvania runabout, also a clean scorer. An encounter with a stony stretch of road broke a steering arm. At noon on Sunday the idling crowds in the Bedford Springs

Hotel grounds were suddenly awakened to life by the appearance of Owen on his runabout, evidently in good shape, the broken steering arm having been replaced.

Only two men, G. S. Smith on a Stoddard-Dayton and H. K. Sheridan on a White steamer, now remained with clean scores out of an original list of eleven competitors. John Haynes arrived on time and was checked in as perfect, but as he had stripped a gear on the journey, had previous penalizations and had no intention of continuing as a competitor, the contest for the Hower trophy narrowed down to a duel between the Stoddard-Dayton and the White.

S. Black, in charge of Lozier No. 25, Sunday afternoon drove into the hotel grounds with his two front springs patched up with stays and buffers and one rear spring in a weakened condition, having successfully crossed the mountains.

BEDFORD SPRINGS, PA., July 22.—When early risers looked down into the hotel grounds this Monday morning they were surprised to find that a couple of runabouts had slipped in quietly during the night. R. G. Kelsey's big Matheson, No. 106, withdrawn several days before with a broken connecting rod, had made a night journey, as was evidenced by its searchlight and lamp for speedometer. Thomas runabout No. 114, attending to Warner speedometer business, had come in on a flat tire, with a weakened right front spring, and a left front spring which had not formed part of the car's make-up when the tour began. The driver, J. G. Barclay, on retiring for a well-earned rest, gave orders to be called at an early hour, but only woke when the tire cars had gone, and so had to await the arrival of a new set of tires.

## TENTH DAY'S SCENIC BEAUTY WASTED ON CONTESTANTS

BALTIMORE, Md., July 22.—The route of to-day's 140-mile run supplied scenic beauty in abundance, and though they had what proved to be a most liberal schedule in ten hours for the journey none of the contestants and few of the others took time to observe the grand country through which they passed. From Bedford to Foltz there was mountainous driving, some forty miles, over Rays Hill, Sidling Hill and Scrub Hill, and then the conquering of Tuscarora Mountain. Of course, there were the water bars, but the roadbed was solid and the scenery alluring in the extreme. The Little Juniata River was followed in the early miles of the run, and the rippling stream, gurgling along, often underneath a canopy of foliage, supplied an inviting pacemaker. The red dirt road was dusty and there came discomfort when the cars bunched.

Descending Tuscarora Mountain, its side revealed panoramas of scenery the thorough enjoyment of which was spoiled by the

incessant water bars, which the drivers continued to cuss long and loud and the tonneau passengers added much strength to the vociferous expletives.

At Foltz the pike into Hagerstown began, but before that city was reached there came an easy climb of the Blue Ridge Mountains, which contributed scenery less rugged than that of the Alleghenies, but possibly more pleasing to the eye. How good that pike felt is easily imagined, for despite the fact that it contained water bars these spoilers of pleasure traveling were not of such an obnoxious sort as those met with in Pennsylvania.

Maryland's hills looked like a "Garden of the Lord" to the famished auto horde, and its red brick houses, whitewashed barns, and stone fences, with fields of grain, harvested and stacked, presented a picture that few saw as the winding ribbon of road wore away beneath their flying car.

Some did stop for dinner in historic Frederick, with its Bar-

bara Freitchie lore, but the greater number followed close on the heels of Chairman Hower's pacemaking car and scurried for the outskirts of Baltimore, there to kill time until they could report at the night control.

It was a pity that the grandest day's run of the tour should have been so scantily appreciated except by a handful.

#### One Perfect-score Car Loses Its Place.

The New York Motor Club was a severe sufferer in the day's run, owing to the heavy penalization of Stoddard-Dayton No. 38 to the extent of 142 points for late arrival, and of Mrs. Cuneo also for late arrival with her Rainier No. 26. W. W. Macdonald, the Stoddard-Dayton driver, had brought his car to every previous control with a perfect score, but was seriously delayed on this stage by the brakes burning out. Later a pin sheared on the transmission brake, causing a further loss of time.

Mrs. Cuneo's Rainier, which started out with a broken front spring, had a blowout of one of the front tires, which rendered the car momentarily unmanageable. It swung off the road between a telegraph pole and a tree, bending the front axle so seriously that a lengthy stay had to be made at a nearby blacksmith's shop.

Excepting the Elmore, which arrived three minutes late, owing to water circulation troubles—the fan having broken and the driver refusing to remove the seals which he had placed on the car at the commencement of the trip—and the already heavily penalized Mitchell, which obtained 60 points more, all contestants finished the day's run perfectly.

No changes were made in the position for the Hower trophy, the White steamer and the Stoddard-Dayton remaining with perfect score, while A. E. Hughes retained his previous position with Pierce No. 100 penalized a total of six points.

## ON THE ELEVENTH DAY THERE WAS DUSTY RIDING

PHILADELPHIA, July 23.—There was little of pleasure touring in the long 174 miles roundabout run from Baltimore, over roads which spilled dust and reeked with water bars—that abomination inflicted upon highway travelers by the roadmakers of the Keystone State. The Marylanders are similarly partially guilty, but not to the extent of the Pennsylvanians.

In the vicinity of Hanover there is one T. J. O'Neill, vice-president of the Automobile Association of York county, and he and his associates have convinced some of the road supervisors that water bars are not essential to the life of a highway, and on both sides of Hanover there was a welcome relief from these preventives to automobile enjoyment.

To-day in Hanover the way into, through and out of town was marked with white flags, and two railroad crossings were specially guarded, as the dusty caravan flew along. As it entered York a sign placed by the A. A. of Y. C. told that the speed law was being strictly enforced. Sure enough it was, for a chain of "cops" extended through the entire town, the inhospitality of which will be remembered for some time to come. One might have thought that a band of desperadoes were coming, of which the town desired to protect itself from.

The numerous toll gates, the soft roads and the innumerable water bars made the run one of the most trying and disagreeable of the tour. At Lancaster the local automobile club supplied appreciated lemonade that washed out the throats of the parched tourists.

Near Philadelphia, at Glen Loch, the enterprising *Press* had hung a banner of welcome, at which were given pennants that carried the incoming cars past all the remaining toll gates without the annoyance of shelling out small change and stopping. Light refreshments also were tossed into the cars.

UTILIZING THE THOMAS'S GENEROUS LOAD OF GOODRICH TIRES.

At Bryn Mawr the Pennsylvania Auto Motor Company made an acceptable gift to the arrivals in the form of baskets of fruit, chilled and palatable.

"We wish you all success," the accompanying card said, though "Wally" Owen, the company's representative, had met with misfortune on the rough Pittsburg-Bedford section and mournfully came along of necessity as a non-contestant.

At Ardmore the Autocar Company said on a banner across the road: "If we can help you, stop!" But the kindly offer did not find many takers, the Quaker City being too near at hand.

To-night the Quaker City Motor Club vociferously entertained the tourists at the Majestic Hotel, Mayor Reyburn officially welcoming the party to the city. The Automobile Club of Philadelphia and the Automobile Club of Germantown also extended courtesies to the visitors.

#### Score Changes of the Day.

Although all the clean-score men for both Glidden and Hower trophies maintained their position, the day was responsible for a number of penalizations among those who had already suffered. Haynes No. 55 at an early stage of the journey had to abandon with a broken rear axle, after having done nine days clean running and been penalized two points on another day.

F. J. Pardee, driving American Mors No. 10, was in exactly the same position as the Haynes driver. For nine days he had run clean, on one day had a minimum penalization and to-day fell down entirely through having to change his left rear spring and repair a broken leaf of the right rear spring.

Mrs. Cuneo arrived in Philadelphia on her Rainier No. 26 about half-past 8 o'clock and was penalized 191 points. On the tenth day the breakage of one front spring caused her to incur a penalty of 426 points, and, the opposite side having given trouble to-day, she went still further down in the list. To bring the car in under such conditions required a large amount of courage on the part of the lady driver—courage which was rewarded by a rousing cheer from those gathered about the hotel—for one spring was propped up entirely by buffers of various kinds and the other was patched up with half leaves and could have had very little life.

In No. 7 Welch, driven by F. S. Welch, a very promising competitor was wiped off the list through the breaking of a crankshaft. The Welch's previous performance had been twelve points on the first day for a road accident in no way imputable to the mechanism, and a clean score on every succeeding stage. This failure caused the Automobile Club of Detroit to be wiped out of the competition for the Glidden trophy.

Meteor No. 37 arrived on schedule time, but owing principally to a damaged radiator and a collision with a trolley car the automobile had been out of the competition for a couple of days, A. L. Peterson's object in continuing being to get a certificate for having covered the entire distance.

# Along the Road and at the Night Stops—

WALTER C. WHITE IN HIS WHITE STEAMER ON THE ROAD NEAR INDIANAPOLIS.

**A Good-Roads Auto Caravan.**—Reflecting upon these things, it occurs that the best way to campaign for good roads would be to have just such a caravan of automobiles as composes the present A. A. A. tour carry a delegation on a long tour, instead of their traveling about by train, as they now do. In this way they would, first of all, speak with the feeling of personal experience, and, secondly, they could make their appeals in the various localities effective by employing the pointedness of local conditions. Through Ohio, Illinois and Indiana are to be found rich farming districts, where the sturdy agrarians get but one day's wage for the toil of two days, because what they harvest from the fields on one day it takes them one full day more to realize upon in cash, the second day being spent in the haul to market and back, whereas good roads and the modern vehicles that are concomitants would reduce their hauling to fully half the time. It takes the concrete example to reach the bucolic mind, and, therefore, such a campaign as suggested, with the evangelism of road improvement gathering the data for local argument as they proceeded, would probably be more effective than any yet conducted, for at the bottom of this whole road problem is the blindness of the farmer to the practical benefits of good roads and his unwillingness to submit to taxes for highway improvement.

**But It Is Inaccessible.**—In the Alleghenies the tourists passed through one place where there was tossed into each car a well printed and floridly written pamphlet extolling the merits of the place as a summer resort. It was a puny bit of a village, but, as the book said, it was "dropped like a gem in the setting of the grandest mountains," and it really might become something of a resort if there were some way of getting to it, and opportunities for riding, driving and motoring after one was there. Yet the minds of the people had not been opened to the paramount necessity of accessibility and of good roads in the vicinity of any resort, so they were spending money advertising before they had the goods, instead of getting busy on road improvement. If this place was visited by such a touring party as suggested, and the Supervisors taken for a trip in the cars, the situation could be made clear to them as in no other way. They would realize that first of all they must have the roads, and the building of them would, in the majority of cases, begin forthwith.

**Brakes Were Well Tried.**—On Saturday, when the trip over the Allegheny summits revealed how much brakes have been improved and how much there is yet to be done in this direction, the Berliet car, which had been a more or less sensational performer all along, was revealed as being dif-

ferently fitted in this respect than any other. It raced up and down the hills and bumped along without any trouble, just as it had been doing every day, and it was wondered why its brakes did not heat up. Investigation developed the fact that it can alternate its braking system in four different applications. The clutch can be thrown out and the gear lever set at neutral, so that the driver does not have to hold the clutch pedal back with one foot, but has them both free for the two foot brakes. Then he can alternate with the foot brakes the emergency hand brake, and can also brake with the engine.

**How Goodrich Looked After Its Users.**—A big Thomas Flyer, with its capacious tonneau stocked with outer shoes, inner tubes, repair outfits and detachable rims, was constantly on the search from Cleveland to New York for Goodrich tire users in need of a replenishment of their stock. H. C. Miller, general representative of the Goodrich Company, had charge of the tire equipment, with W. H. Rutherford assistant, while W. Turner sat in authority at the wheel. It was an exceptionally heavy load that the Thomas carried in its tarpaulin-covered tonneau, yet the car was never delayed by tire troubles of its own. To carry a load of tires insures freedom from tire trouble, declared the Goodrich representative. Other travelers on the 1,600-mile journey had their reasonable share of punctures, but were never troubled with blowouts.

**Our Alleged Roads.**—From the first day out the impression that has been at once primary and paramount is the wildness of American roads. It strikes one that all the fine phrases about the conquest of the West and the subjection of the wilderness is merest moonshine, when twenty miles from the principal cities of the various States are found alleged roads that in reality are old trails, practically unimproved since the early settlers used them. Perhaps the road conditions were no great surprise to any one, because such execrable highways are to be found in the native State of every American; but the long stretches of primitive clay roads, running through fertile farming districts and connecting important cities of the Middle West, gave to those who had not toured this section before a new and very vivid appreciation of the need of a main pike between the cities.

**Something About "Napoleon" Hower.**—As the tour progressed the participants grew to like Chairman F. B. Hower much better than they did at the beginning. It became apparent that in his autocracy he was showing no favoritism, but ruled impartially and without vacillating. His task was difficult and at times exasperating, but he was always ready to hear what any complainant had to say. Mr. Hower is

JOHN HAYNES AND THE DRAGON ARRIVING AT INDIANAPOLIS.

the first vice-president of the Automobile Club of Buffalo, and will probably succeed to the presidency next year. For ten years he was commodore of the Buffalo Yacht Club, and his services were so acceptable that the only manner in which he escaped a further continuance in office was to sell his boat and thus become ineligible.

**How Diamond Tires Were Supplied.**—Diamond tire users had their stand-by in a White steamer, fitted with a special body for carrying casings, tubes, repair outfits and tools, which accompanied the competitors and gave help where help was needed. H. G. Smith, of the Diamond Tire Company, had charge of the equipment, and H. E. Stein drove the steamer throughout. A stock of about eighteen casings and fifty tubes were carried continuously on the car, the provision being renewed each night from a large quantity traveling from point to point by rail. Tire assistant is a strenuous occupation, declared H. G. Smith, for the relieving car must be out first and come in last, and when control is reached a busy time is spent getting in touch with the various drivers, noting their wants, arranging for the shipment of old stock back to the factory and the forwarding of the new material to the next stopping point.

**The Sealed Bonnet Maxwell.**—One of the real marvels of the run from Chicago east was the keeping of the pace by Charles Price's little 16-20 Maxwell, that has been running with its bonnet sealed since June 28, when it started in the Chicago reliability run. Afterward it was one of the winning team in a six-hour race at Peoria, Ill., and ran until the last hour of the 24-hour race at the Harlem track, Chicago, on July 13, until it was put out of business by a collision. Its seals remained intact, and during the tour they were inspected every day by David Beecroft, of the committee of the Chicago A. C., who first put them on.

JOHNSTON'S CONTINENTAL RUNABOUT, WHICH HAD HARD LUCK.

**Greetings Along the Line.**—While there were cities and towns on the route of the tour that gave slight heed to the passing of the motor-driven procession, enthusiasm as a rule was contagious, and the greetings of onlooker and autoist were simultaneous. One who never tired of shouting a resonant hello to all comers was J. W. Gogarn, publicity manager of R. M. Owen & Co., and frequently when the observer seemed a bit backward, especially in country districts, Mr. Gogarn brought forth a quick response by his insistent way of salutation.

**The Experimental "Little Six" Pierce.**—No car commanded more attention during the tour than the one used officially by Chairman Hower, with whom Mr. Glidden also rode. This car is the first small six-cylinder of the Pierce Company, and it was "tried out" on tour with the capable Winchester at the wheel, supplemented by "Jack" Utely, once chief mechanic on the warship Kearsarge, and "Tony" Ledderman. If there were any faults in the "Little Six" needing correction it is a certainty that this trio discovered them.

**The Spaghetti Bunch.**—Beyond question, the hardest workers on the tour were the drivers and occupants of the two "spaghetti" cars—Maxwell and Premier. Earliest up in the morning, it was mighty hard for them to seek their cots early enough to get sufficient sleep. "General" Lewis and "Lieutenant" Mortimer Reeves were on the job all the time, and Drivers Reynolds and McNamara never failed at any stage of the game. Starter and Checker-in Ferguson was another who worried along unruffled with small chunks of sleep.

**Regulars Didn't Like the Autoists.**—The arrival of the automobilists at Bedford Springs was regarded as an insolent intrusion by that peculiar person, the chronic sojourner at pleasure resorts, who, like birds of passage, hies from hotels south to others in the north and back again as the weather changes. One woman was overheard to remark to her companion at the Springs: "I suppose, after these dirty autoists go away, they will clean out the swimming tank, won't they?"

**That Chicago-New York Highway.**—It is safe to say that those who previously had been but mildly interested in the project of a New York and Chicago highway will henceforth be enthusiastic, and they will go even further, for after the trip over the long stretch of the Old National Highway, from Indianapolis to Columbus, no one could fail to wonder why this bit of roadwork never has been continued until it became a transcontinental causeway.

**One Publicity Man Who Drove.**—R. H. Johnson, the energetic exponent of White publicity, drove his steamer through the entire tour. It is only in the past few months that Mr. Johnson has taken a place at the wheel, and though he has "trade affiliations," he must be considered an amateur driver. Therefore his feat must be rated most excellent, for there were no simon-pure amateurs who completed the long tour in the driver's seat.

**What One Hotel Proprietor Said.**—There is a mighty fine hotel in South Bend, Ind., and its proprietor, Mr. Oliver, who gave the house his name, passed out some advice to his clerks, bellboys and help before the rather unprepossessing cavalcade of autoists arrived. "Don't judge any of these men by their clothes or appearance," spoke he, "for they may be millionaires, despite their disguises."

**Lid Off for Autoists in Pittsburg.**—At Pittsburg the Chief of Police declared that the lid was off regarding speed, and the way the cars raced into and out of that burg, under police protection, would have made a New York cop faint away.

# DYNAMIC PROPERTIES OF VANADIUM STEEL\*

By J. KENT SMITH.

BEFORE I speak of vanadium itself, perhaps you will allow me to say just a few words on the subject of steel from an engineering standpoint. Under the conditions of practice comparatively few years ago we were accustomed to judge with considerable success the steels that we had by their behavior under static tests, that is to say, under tests where the force and the body were more or less at rest, or, anyway, very slowly moving. We had a rough kind of an idea that anything that gave certain static tests would behave in a certain way in use. But as things have progressed, our point of view has changed in regard to this somewhat. A body may be perfectly statically ductile and a body may be perfectly susceptible to satisfactory static tests, and yet when you apply stress tests dynamically (hit the body or vibrate it, or anything like that), it goes to pieces or something happens. As the conditions of engineering requirements got more drastic, we began to have more and more breakdowns, which we were accustomed to call "mysterious failures." Of course, a few of the cases of failure were not mysterious, because the metal was obviously of bad composition; but in very many cases the metal would give perfectly good tests chemically and statically; it might even look perfectly well under the microscope, yet it had broken. The fact of the matter was, it practically got tired of its work and had "thrown up the job."

### Series of Light Blows May Prove Fatal.

I think it is beyond argument that we can break a piece of metal by applying repeated strains less than its elastic limit. For instance, supposing we take a piece of metal the elastic limit of which is represented by any number as 10. Now, if we put a series of strains on that metal, each of whose intensity is only represented by the number 5, in due time we will fracture it. If such strains be only represented in intensity by the number 2 1-2, we will in time fracture the metal, but in an interval of time much greater than twice that accompanying the first set of conditions. In other words, all steels deteriorate under repeated strains, and such deterioration is enormously more rapid as those repeated strains approach the elastic limit of the steel. *But such rate of deterioration is not proportionate in different steels, and it is precisely here that the very great value of vanadium comes in, as the vanadium steels have proved themselves, both by test and in practice, to be absolutely pre-eminent in their power of resisting such deterioration.*

The usual dynamic tests include a sweeping shock on a notched bar, repeated blows by a falling weight on either a notched or an unnotched bar, rapidly alternating impacts accompanied by permanent distortion on an unnotched bar, and rotary vibratory flexion tests produced by the suspension of a counter-weight on a rapidly revolving bar of such shape that the area of fracture is definitely located.

### Comparative Life Under Repeated Stress.

The rate of deterioration before alluded to as to repeated stresses becomes less severe, as is amply illustrated in Table I.

I strongly advocate also that the usual static "tensile and bend" tests should, in many cases, be supplemented by the knowledge of the behavior of the steel under torsion, while I attach great importance to the repeated bend test made in such a way as to indicate the point at which the metal begins to "break down." In those respects the vanadium steels take the front rank. The action of vanadium is very powerful; it

may be said that vanadium is to metallurgy what strychnine is to medicine, and therefore it is only used in small quantity, or carrying out the simile, small doses.

Vanadium increases the strength of steel *per se*, but to the greatest extent by acting through another constituent

TABLE I. COMPARATIVE EFFECTS OF CHROMIUM AND VANADIUM ON STATIC TESTS.

ROLLED BARS UNTREATED	Pounds per Sq. In. Elastic Limit	Ultimate Tensile Stress	Elongation on 2 Ins.	Reduction of Area
	Tons Per Sq. In.	Tons Per Sq. In.	Per Cent.	Per Cent.
<i>Crucible steels:</i>				
Plain carbon-manganese.....	35,840	60,480	35	60.0
Plain + 0.5 per cent. chromium.	51,206	76,160	33	60.6
Plain + 1.0 per cent. chromium.	56,000	85,568	30	57.3
Plain + 0.1 per cent. vanadium.	63,840	77,952	31	60.0
Plain + 0.15 per cent. vanadium.	68,006	81,760	26	59.0
Plain + 0.25 per cent. vanadium.	76,384	88,032	24	59.0
Plain + 1 per cent. chromium + 0.15 per cent. vanadium.....	81,088	108,864	24	56.6
Plain + 1 per cent. chromium + 0.25 per cent. vanadium.....	90,496	135,296	18.5	46.3
<i>Open-hearth steels:</i>				
Plain carbon-manganese.....				
Plain carbon + 1.0 per cent. Chromium + 0.15 per cent. Vanadium.....	39,648	72,128	34	52.6
	77,056	116,480	25	55.5

(present in such quantity as not to dynamically "poison" the steel in question), while it confers in itself to steel properties of great dynamic value. The first is exemplified by the table.

### Its Value as a Master Alloy.

Vanadium thus can be regarded as a "master" alloy, in that it can act in totally different ways, and by judiciously using it in the line one wishes to follow, steels of great dynamic superexcellence, great static superexcellence, or combinations of both, are attainable, such as can be obtained by *no other known means*. The second table illustrates types of this.

The "vanadium axle steel" is of particular interest, as the attainment of steel statically comparable with a nickel steel, in fact superior to it, even statically, combined with the ductility of mild steel and an infinitely greater power of

TABLE II.\*

N. B.—All figures obtained *under* comparative conditions.

NATURE AND TESTS	1 Carbon "Axle" Stock	2 Nickel "Axle" Stock	3 Vanadium Axle Steel	4 Vanadium Crank-shaft Steel	5 Vanadium "Continual Mesh" Gear Steel
<i>Static—</i>					
Yield point (lbs. sq. in.)	41,330	40,270	63,570	110,100	224,000
Ultimate stress.....	65,840	87,360	94,080	127,800	232,750
Ratio.....	0.62	0.56	0.66	0.87	0.96

Falling w'ght on n'ched bar, number of blows	25	35	69	76	.....
Rotary vibrat'ns, number of revolutions...	6,200	10,000	67,500	.....	.....

resisting fatigue, as evidenced by vibratory and alternating impact tests—such inference, I may say, is amply borne out by practical experience, puts a new phase on the "factor of safety" question in connecting rods, coupling rods, crankshafts and the like.

### As a Component of Spring Steel.

In another grade comes vanadium spring steel, which has proved of enormous value, not only in enabling a spring to be

\*Extract from a lecture delivered before the Central Railway Club, Buffalo, New York, by J. Kent Smith, Chief Metallurgist of The American Vanadium Company, Pittsburg, Pa.

made having twice the coefficient of safe working load (and thereby rendering possible the lightening of the spring itself), but at the same time one which is, so to speak, endowed with the property of "life" and does not "get tired" and break down as a pure result of service. Again, the value of such a spring is great in regard to the fact that it can safely meet "overload."

The subject of case-hardening is a fascinating one, and one that could with justice occupy half a dozen lectures itself. In a lecture such as this it would be impossible to go into detail. Suffice it to say, therefore, that no *tempering steel* should be case-hardened, owing to the inevitable brittleness produced in the core through the necessary operation of quenching. A special variant of vanadium steel is made for this process, utilizing the toughening action of vanadium on a quenched high carbon steel and the conferring of strengthening and fatigue-resisting qualities to the core of the article, thus enabling a result of wonderful value to be obtained.

Vanadium case-hardening steel stands on record as the finest material of its kind, as the result of very great numbers of practical experiences.

#### As a Factor in Steel Castings.

Vanadium has been very successfully used in castings. It is not advisable, from a practical steel-founding point of view, to use chrome in a "casting." We use plain vanadium, and we anneal the casting at about 950 degrees Centigrade. Then you will get a casting which, in resisting vibration, is very much like a good type of forged carbon steel; it is infinitely superior to the ordinary carbon steel *casting*. Of course, the ordinary steel casting in carbon does not stand vibration like forged carbon steel, but the vanadium steel *casting* will stand it like a carbon steel *forging*, while in its use in casting we are getting a combined static and dynamic action. We are increasing the static strength considerably, if not to the fullest extent, while we are increasing the dynamic qualities enormously. We use it in casting chiefly with a view of increasing "dynamics" and not "statics." I may seem to be a kind of a maniac on dynamic tests, but their importance has been borne on me so often in ordinary work. There is no doubt about one thing—you cannot adduce dynamic qualities from static tests any more than you can do the other way about; they are in two totally "different streets," to use an every-day expression.

Vanadium steels are no more difficult to forge than the ordinary corresponding steels. The only word of warning I would sound here is that vanadium steels must be treated as high-temper steels. That is to say, we must not go and plunge the heat into it all at once. Vanadium structural steel forges exactly like a 3 1-2 per cent. nickel steel. If you apply the heat and work to it at first reasonably gradually you will have no trouble afterward. The steel will stand as much heat as mild steel, but in heating any steel of high temper you are very liable to disintegrate the metal and you have to observe reasonable care and precaution. As regards the maximum contents of vanadium I have found myself, from experience, it is very seldom advisable to go above 2 per cent.; certainly never above 25 per cent.

#### Its Use in Other Special Services.

There is no doubt in my mind that the chief difficulty at present existing in the locomotive frame is the resistance through molecular disintegration. If we use vanadium there we cure it; there is no question about it. That has been a shining example of where "dynamics" came into play, almost exclusively; it is almost simply and solely a question of resisting vibratory molecular deterioration.

I hope that I have not given the wrong impression, I have harped so much on the question of dynamics to the seeming exclusion of statics. Do not think that I am sneering at the static tests or that I apparently dismiss the value of high

static strength and ductility. I do not. I attach great importance to them. But I speak from experience when I say that I am sure that we were beginning to lose ourselves in straining to get a high static strength that we really *did not want*, at the sacrifice of something that we *did want*, and therefore that we would have been better off if he had gone less for increased static strength and increased our dynamic qualities.

#### THE MARKET FOR AUTOS IN SOUTH AFRICA.

The following letter has also been received from Consul-General Lay at Capetown regarding the market for American automobiles in South Africa, and the lesson it conveys should be of considerable interest to American manufacturers:

Three or four years ago there were more American cars in South Africa than any other kind. They were not the best type of American cars, being principally runabouts, which were unsuited to the rough roads; consequently they did not last, and American cars got a bad name. It is only fair to state that the cars imported were of the cheap class, and were not fair specimens of American motor manufacture, and I do not think that any really good American car is at present in use in this country, though one would have thought that with notoriously bad roads in the States American cars would be more suited to South Africa than any other. As far as I can at present see, there is nobody attempting to push the trade, and yet I believe trade is to be done, though, owing to the depressed times, not to a very large extent at present; but obviously it is the best car for the money that will sell, and owing to the enormous standardizing in America I believe manufacturers in that country could really put an equally good car on the market at a lower price than English or French makers, though you must remember that there is a 3 per cent. preferential tariff in favor of English cars, the customs being 15 per cent. on foreign cars, with 3 per cent. rebate on English, which, considering cars cannot be manufactured in this country, is a most ridiculous charge.

It is difficult to tell you the cost of running a car per mile, as they vary so much; but if a man drives a car himself of, say, from 10 to 15 horsepower, which is quite sufficient in this country, where the roads will not allow of high speed, and allowing that it runs 6,000 miles a year, I think £100 (\$486.65) per annum is a fair estimate, this including the cost of tires, which is by far the largest item. I think it is more expensive to run cars in Johannesburg than here, because the roads are worse, and generally it is more expensive in South Africa than in any European country because of the enormous tire cost, owing to the rough surface of the roads.

At present there are about 1,000 cars in South Africa. There is no reason why the number should not be doubled if any energetic man pushed the business and gave reasonable terms, and I think that among doctors and commercial travelers customers would be found. In time I think the farmer might be induced to use motor wagons, especially in districts where water is scarce, but it will take some time to educate the farmers up to anything so modern.

Mr. Lay also forwarded a copy of the Handbook of the Automobile Club of South Africa, of which Mr. J. M. P. Muirhead, P. O. box 1161, Cape Town, is the honorary secretary. This book gives chronological landmarks, road maxims, roadside troubles, first aid in accidents, night signals, patrol depots, and table of distances, and is on file for public reference at the Bureau of Manufactures, Washington, D. C.

Present tendencies of design where that most important essential of the power plant is concerned—the lubrication—are decidedly toward the much-desired goal of simplicity. When the automobile first came on the scene its maker found himself compelled to buy all his accessories in the open market, and as a result he had to buy many things that were totally unsuited to his purpose. Not the least of these were oilers—that is their generic title, and as such they were known in connection with the various kinds of machinery for which they had been designed and on which they had been rendering perfectly satisfactory service for years, but that machinery was not the automobile motor, nor anything like it. That became evident after a while and has been so ever since, and, fortunately for the automobile user, the builder recognized that fact long ago and set about making improvements without delay. The result is apparent in the many simple and self-contained systems of lubrication now in use.

## TREND OF INVENTION IN OTHER LANDS

TO what lengths an inventor may go in evolving a highly complicated device to serve a purpose that can be far better carried out by the simplest of arrangements, has seldom been better illustrated than by an instrument which has been given the euphonious title of "Oleometer" and which is shortly to be placed on the market in England. It is described at length in *The Autocar*, from which the accompanying illustration as well as the details of its operation are taken, though, as a matter of fact, the latter are obvious at a glance. It will be seen that it consists of a float chamber communicating with the oil pan of the crankcase, a float in the former carrying contacts making connection with a circuit in which two small incandescent lamps are placed on the dash. One is white and the other red, representing low and high level conditions of the oil in the crankcase and corresponding to the contacts already mentioned, so that when the float rises as a result of an excessive amount of oil in the engine base, the red light shows, and when it falls too low, the white light appears. That is, it does, if the switch under its containing case is pressed, so that the device is not automatic in any sense of

THE OLEOMETER AND ITS COMPLICATIONS.

the word, and pressing the buttons for high and low levels represents an operation which it takes all this complication to act as the substitute of looking at a gauge glass, which is an instrument not provided as often as it should be, or lifting one of the handhole covers off, and they are now made to come off readily in the majority of cars, and are as easily replaced. The Oleometer, on the other hand, relies upon the accumulators for its operation, and in order to be sure that both the latter and the circuits of the device are all in good order, a third button is provided to test them, this lighting both lamps simultaneously and independently of the float-contact apparatus. Such devices are interesting illustrations of what can be done in thinking up new and weird accessories with which to burden the car, but their utility is generally in inverse proportion to their complication.

### To Give Warning of Tire Defections.

For some reason or other, the many devices that have been brought forth at one time or another for the purpose of apprising the driver of a car of the fact that one of the tires has suffered injury in order that it may be repaired before further damage is done, have received little or no attention on the part of the average autoist. With the far smaller tires and heavy cars of a few years ago, it was seldom necessary to provide any other warning than that given by the car itself, yet it has not been unusual even under such conditions to find that a tire has been completely ruined through lack of notice of its condition in good season. Both cars and tires have been improved to such an extent during the interim that it is now nothing unusual to have a tire go flat without the slightest notice of its demise, unless rough spots, car tracks or similar obstructions that cause the rim to come in contact with the ground are encountered, and not infrequently it is driven several miles in this condition. Some of the devices that were placed on the market a few years ago were the

very essence of simplicity, beside being well adapted to give the necessary audible warning of the tire's demise, but somehow or other they "fell flat" instead of the tires they were intended to protect. Now an English concern comes forward with an electrical device of the kind which is described and illustrated in

AN INGENIOUS ELECTRICAL FLAT TIRE ALARM.

*Motor* (London) as follows: "A short brass cylinder containing a plunger is clamped on to one of the spokes as shown. The rod of the plunger carries a boss or foot adjuster, so that it is depressed by the side of the tire on contact with the road when the tire is partly or wholly deflated. On the axle is clamped a metal collar carrying an insulated strip of brass, and when the plunger rod is pushed up it makes contact and completes an electrical circuit and rings a small bell on the dash. The plunger is in direct connection with the frame by means of a copper wire joining it to the hub flange." The battery and ground connections are not shown by the illustration.

As a whole it is so simple that the average autoist, with his knowledge of electricity, could readily set to work and devise something equally effective for himself with very little trouble.

### A New Low Limit in Weight per Horsepower.

With a total weight of slightly less than 100 pounds the new 35-horsepower six-cylinder motor made by Pelterie for aviation, the accompanying illustration of which is taken from *Omnia*, would appear to set a new low limit in the weight of motors of this class that is apparently a very close approach to a possible minimum in this respect. Its arrangement is further unique in that the six cylinders composing it are mounted on a crankcase barely long enough to accommodate two of their size were they placed in the ordinary manner. This also greatly simplifies the engine by making possible

A 100-POUND, 35-H.P. MOTOR.

the employment of a two-throw crankshaft, each group of three cylinders acting upon a common crankpin. Air-cooling is employed, of course, and the cylinders, which are set at an angle of approximately 90 degrees to one another, are also staggered so that each one gets the full benefit of a direct

cooling current. Considerable ingenuity has, of necessity, been exercised in the arrangement of the valve-operating mechanism, the three push rods for the front group of cylinders being of the usual type employed in connection with rocker arms, while the other three are jointed and operate at an angle as shown, the inlet valves being of the automatic type. No details of the dimensions of the motor or of its speed are given, though the latter as well as the compression must naturally be high in order to produce its rating of 35 horsepower. It is of considerable interest as demonstrating to what lengths light weight and compactness may be carried where the internal combustion principle is applied to the design of a motor for aeronautical purposes.

#### Reversible Four-cycle Marine Motor.

Inventors and motor designers have long been engrossed in the study of the four-cycle motor for marine purposes with a view to devising some simple means of reversing the latter. At present a reverse gear or a reversing propeller—the latter only applicable to the smaller sizes of boats—being a necessity in connection with this type of motor. The two-cycle motor is readily reversible merely by manipulation of the ignition advance lever, though many boats using this type of motor also employ some extraneous method of reversing the direction in which the propeller rotates. This new motor is termed the "Reversator," and is the invention of a Swede, C. Luttermann, the illustrations being from *Die Yacht*. It will be evident that the problem consists almost

VALVE MECHANISM AND CAM DETAILS OF REVERSATOR MOTOR.

entirely of the matter of making provision for reversing the cycle of the engine, as is done in the steam engine, when the position of the valve is shifted by means of the reverse lever, thus making what would have been an exhaust stroke, an intake stroke and *vice versa*, as any four-cycle motor can be made to start in the reverse direction merely by advancing the spark sufficiently to cause a backfire, as is done with the two-cycle. The principle is thus the same as that of the steam engine, except that as every other stroke is an idle stroke in the four-cycle motor, the timing of the valves must necessarily be altered to a greater extent, or 90 degrees in a revolution, the inlet valve being advanced that much while the opening of the exhaust is retarded a corresponding amount, or the opposite where the change desired is from a reverse to a forward movement. To accomplish this, a disk with the proper slots cut in its face and in which sliding members work, transmitting the motion to the valve stems, are employed. These slots are cam-shaped, corresponding to the profile of the cams themselves, and the operation of reversing consists in shifting the position of the cam to the extent permitted by the slot. In the sectional illustration, the arrow indicates the direction of forward rotation, while the smaller view shows the exhaust and inlet cams. The lefthand set of cams are those of the exhaust, while the righthand are those of the inlet valve, the position in which they are illustrated corresponding to that required for the normal forward movement, usually denominated "clockwise." Rotating them through 90 degrees causes the motor to reverse.

#### ONE WAY OF PREVENTING TIRE BLOW-OUTS.

By A. D. HARD, M.D., MARSHALL, MINN.

Automobile users who have had experience on country roads know that the most severe wear on pneumatic tires comes from ruts. Hard, sun-baked roads that have been deeply rutted by horse vehicle travel while soft, quickly tear the rubber from the sides of the casings and expose the fabric to still more rapid disintegration until a blow-out report announces that your tire is almost worthless. This side wear is far more destructive than the tread wear, yet no satisfactory device has so far been placed upon the market to eliminate it. I have tried several plans for protecting the sides of my tires, and have settled down upon the one which I am about to describe as the best and cheapest, so I gladly give the benefit of my experience to the readers of *THE AUTOMOBILE* who may have occasion to use rough and rutty country roads, and they are doubtless legion.

Procuring for a song two discarded rim-cut tire casings of the same size that I used on my wheels from the junk pile of a tire repair shop, I removed the clincher flanges with a sharp knife, and also divided the casing square across. With a 1-4-inch punch I made 24 holes in the edges of the casing, equidistant, and 3-4-inch in from the edge. These holes will be almost exactly four inches apart. I then prepare twelve retaining wires for each side of each of my two casings as follows: A piece of No. 8 galvanized iron wire 10 inches long is bent in the shape of a "V" and the ends are bent into hooks at right angles with the plane of the "V," the hooks being 3-4 inch long. These retaining wires are now hooked into the holes in the casings so that the ends of the hooks shall be on the outside, and the hooks closed down upon the casing with a hammer, which will make a good job.

Jack the front wheel up, deflate the tire and place this prepared protector on over the casing. It will not reach all the way round, and a gap of four or five inches will have to be filled by fitting in a small section of the same kind of tire casing and retaining it by several double hooks 2 inches long made of No. 8 galvanized iron wire, with the ends of the hooks outward. When the protector is in place on the wheel the "V" shaped retaining wires should correspond with the spaces between the twelve spokes of the wheel. Now, with a piece of rawhide lace leather, 1-2-inch wide, the retaining wires are laced to the wheel spokes, the lace leather passing first around the spoke and then through the apex of the "V" shaped wire until both sides of the protector are firmly held to the sides of the tire. The tire is then inflated and you have a double casing on your front wheels with the sides well protected by the rows of iron hooks, which project exactly where the side wear comes from rutty roads. It will be noticed that I have directed that these protectors be placed upon the front wheels. The reason for it is as follows: The presence of this protector increases the diameter of the front tire from 1-2 to 3-4 inch, and when it has passed through a rut, the action of the protruding wires and the increased diameter leave the rut enlarged so that the rear wheel tire can pass through with little, if any, wear. This also obviates the retarding influence of the rut on the rear wheel, and greater propelling power is available. The front tires look a little clumsy, but the fact that they are almost absolutely free from all punctures, stone bruises, rim cuts, tread and side wear and blow-outs, combined with the fact that the rear tires are incidentally protected and given a good path to travel in, is satisfaction enough to offset almost any amount of clumsy appearance.

"The development of the internal combustion motor has not been so startlingly rapid as that of the steam turbine, but in one essential point it assumed a leading position, and it has retained that position over all other prime movers. I refer to the heat efficiency of the engine. The early gas engines of the now prevailing compression type had an indicated efficiency of about 16 per cent. This efficiency has been slowly increased, until at the present time gas engines are in regular use having an indicated efficiency of 35 per cent., and even a little over. No steam engine efficiency can be compared with these figures."—*Dugald Clerk*.

## LETTERS INTERESTING AND INSTRUCTIVE

### The Office of Contact Breakers and Tremblers.

Editor THE AUTOMOBILE:

[829.]—I have read a number of articles in "The Automobile" on the subject of magnetos, induction coils, and wiring in general, but I have not yet found any that explain the office of the circuit-breaker on the magneto and the vibrator on the induction coil. Will you please enlighten me?  
A SUBSCRIBER.

Los Angeles, Cal.

The contact breaker on the magneto has two very important functions to perform. The type of high-tension magneto in general use is synchronized with the motor, that is, its operation keeps step with the latter and the working of the contact breaker is made to correspond exactly with the occurrence of the two impulses per revolution of the usual four-cylinder, four-cycle motor. Its other function is purely electrical. You are probably aware that the magneto with its H or Siemens type of armature, would generate four peaks, or current impulses per revolution, when revolved continuously. The second office of the contact breaker is to utilize but two of these current impulses per revolution, and also, which is the most important, to maintain the armature winding short-circuited upon itself except at the very moment that the current is needed to create the spark for firing the charge. In other words, the current under these circumstances is said to "build up" to the point at which the contact breaker opens, allowing the current to pass into the external circuit, this point corresponding with that of the peak of the alternating wave generated by the magneto. Thus the contact breaker's chief function is to hold back the current until it reaches its maximum value for ignition purposes.

Regarding the vibrator of the ordinary induction coil used for ignition, this is necessary to give the current the periodicity required to enable the coil to operate. A continuous current sent through the primary winding of an induction coil without the interposition of a trembler or vibrator would not produce more than a single secondary impulse at the terminals of the latter winding, so that when a repetition of this is desired, it is necessary to make and break the contact in order that the core of the primary coil may be successively magnetized and as rapidly demagnetized, the rapidity of the latter action within certain limits determining the efficiency of the coil.

As an alternating current fluctuates from zero to its maximum value in alternate cycles, no trembler is necessary when used with an induction coil, although promptness and more than either certainty of action are of paramount importance for ignition service.

### What Is the Fuel Consumption of Various Sized Motors?

Editor THE AUTOMOBILE:

[830.]—Can you inform me the amount of gasoline a car should use in relation to the bore and stroke of its engine, as well as its rated horsepower, when running from 15 to 30 miles per hour?

Prince's Bay, N. Y.

H. V. ROTOPAN.

We have no such data at hand and to our knowledge nothing of the kind has ever been definitely ascertained and preserved. The condition you mention, *i. e.* running 15 to 30 miles an hour, is much too indefinite to base any calculations of fuel consumption on, as the latter would naturally depend on the load, this consisting of the car itself, whether the touring type or a runabout, whether it had a full complement of passengers or not and more than either of these, the condition of the road and the gradients as it will be readily evident that more than twice as much gasoline will be necessary to propel the same weight of car through deep mud and sand on a hilly road as would be required over a smooth and level surface. The light touring car of 20 to 30 horsepower is popularly considered as being capable of making twenty miles on a gallon of gasoline, while the heavy car of 45 to 60 horsepower requires a gallon for every ten to fifteen miles, these figures differing with the conditions and being based on the experience of a number of drivers during the past few years.

### How to Place a New Valve on an Inner Tube.

Editor THE AUTOMOBILE:

[831.]—I find your Letters Interesting and Instructive very helpful, but there is a question that I am unable to find an answer to in any of the automobilizing books or papers, and I have not seen it discussed in your columns, though it may have been up in early numbers before I began to take "The Automobile." This is the matter of repairing, or putting in a new valve for the inner tube, when, as so often occurs, it leaks or goes out of business for other reasons.

The old valve is vulcanized to the inner tube. To attach a new one, do you cut out the old one at the base and attach the new one in the same place with the aid of an acid and cement solution, such as is used for patches, or in what way can the repair be made?

Does the flat base of the new valve go on the outside or the inside of the tube?

These may seem very simple questions to people who know, but it is just these simple little things that the new hand does not know, and that he is rather ashamed to ask his friends about for fear they may laugh at him for his ignorance. "A NOVICE."

St. Paul, Minn.

Doubtless the reason why you have never seen this request for information in our columns, as well as your not finding it dwelt upon in books concerning the automobile, is due to the fact that it is decidedly not a repair that comes within the province of the amateur. If you have any inner tubes that require new valves, we should recommend by all means that they be forwarded to the manufacturer or sent to one of the numerous branch depots scattered throughout the country and which are about the only places that have the proper facilities for doing work of this nature. The flat base of the new valve goes on the outside of the tube, but it requires an experienced hand at tire repairing to put it on properly, and we doubt very much if the ordinary acid and cement solution such as is used for making emergency patches will make a satisfactory job of such a repair. To our knowledge it is one that is seldom, if ever, attempted by the amateur, as it can only be satisfactorily done on the large automobile tires now in universal use by those experienced in doing such work and who have the proper facilities for carrying it out.

### Some Questions Concerning a Motorcycle.

Editor THE AUTOMOBILE:

[832.]—How can the power of a 21-2-horsepower motorcycle engine be increased to 3 or 3 1/2 horsepower without altering the motor very much? Could this be done by lengthening or shortening the connecting rod?

(2) If a motorcycle engine were to be run as a stationary engine, would it be necessary to put another flywheel on the outside of the crankcase, beside the two on the inside?

(3) Can you give me some idea as to how the horsepower of an engine is found? An answer under the head Letters Interesting and Instructive will be appreciated.

A SUBSCRIBER.

Chicago, Ill.

We should not recommend attempting to increase the horsepower of a motor such as you mention, particularly when the increase desired is in excess of 50 per cent. of the original power. The power of a motor may be increased to a certain extent without any very radical alterations, but the result is never a certainty, and the change may involve unexpected complications that render the motor altogether worthless. An increase of compression is the expedient most frequently resorted to in order to increase a motor's output. The simplest way of doing this is to tap the inner side of the cylinder head and fasten a small cast iron plate to it in order to reduce the clearance space, but this must be carefully done, so as not to obstruct the valve ports. It can also be done by using a longer connecting rod, but this is not advisable, as the result is apt to be the destruction of the balance of the moving parts made by the original designer.

2. It would not be necessary to add a third flywheel to the motor when used for stationary purposes, but we doubt very much if there is any motorcycle engine on the market that is adaptable

to this service, as it is the extreme opposite to that for which it is designed. In fact, such engines usually have a very high compression and it is doubtful if they could be kept cool for more than a comparatively short time when running stationary and under load.

3. The horsepower of an engine is found by multiplying the mean effective pressure, usually written m. e. p., by the length of the stroke in inches, times the area of the piston head, times the number of power impulses per minute, this product then being divided by 33,000, which represents the equivalent of a horsepower in foot pounds per minute. For ordinary calculations the pressure, which is one of the most important factors, is usually assumed. The formula adopted by the Mechanical Branch of the Licensed Association of Automobile Manufacturers, after much study, is the following:  $\frac{D^2 \times N}{2.5}$ , where D represents the diameter of the cylinder squared, times N, or the number of cylinders, divided by 2.5, which is a constant computed from the known horsepower of a large number of the most representative American four-cylinder motors. The formula given above is usually written  $\frac{PLAN}{33,000}$  and has long been employed in calculating the power of steam engines, the only change made in it being that N represents the number of power impulses per minute instead of the number of revolutions as in the steam engine. The brake horsepower is found by testing the engine on the brake, that is, applying an adjustable load to it with the aid of a dynamometer, the motor usually being coupled to a dynamo, the current output of which is measured while the speed of the motor is also taken. At the same time indicator cards are taken and with the aid of a planimeter, the exact m. e. p. of the engine is calculated.

#### Some Queries Regarding Extreme Offsetting.

Editor THE AUTOMOBILE:

[833.]—Presuming that you are conversant with the Ramsay crank mechanism, which has a connecting rod about 3 3/8 times the length of the crank, and a crank of ordinary design, having the shaft located off the axis of the cylinder a distance equal to the length of the crank, I would like to have you inform me, under Letters Interesting and Instructive, if the following conclusions drawn by the Ramsay people are, in your estimation, correct. If not, why not, and if so, is there anything not shown by the Ramsay people that could in your opinion seem to offset the following advantages, as claimed by them.

1. It increases the crank effort.
2. It applies energy to the crank during 192 degrees of crank travel, as compared with 180 degrees in the ordinary engine.
3. It reduces cylinder friction.
4. It gives a slower movement to the piston at the beginning of the return stroke, reducing back pressure and allowing for more thorough expulsion of the exhaust gases.
5. When the cylinder has become warm it decreases leakage during compression.
6. It makes practicable the use of splash lubrication for horizontal engines.

Last, but not least,

7. It makes an auxiliary exhaust port practicable without any of the existing disadvantages.

G. W. TYRELL, M.D.

Perth Amboy, N. J.

In our opinion, the Ramsay engine is merely an instance of carrying to an extreme a principle that has been found to be beneficial on a very limited scale. Some of the very old steam engines of the single-acting type were built in this way, but that is so long ago that but few in the present generation are aware of the fact. Of late years it has been found of benefit to design automobile engines with the center of the cylinders slightly off that of the axis of the crankshaft, the offset being to the side of the idle stroke in order to bring the connecting rod more nearly vertical on the power stroke. This reduces friction considerably by cutting down the angular pressure of the connecting rod against the piston, which in turn bears very hard against the cylinder wall and tends to cut down the power slightly in the ordinary engine. But it has long been recognized that carrying the principle to an extreme involved the very disadvantage that it was designed to obviate. That is, it introduced an excessive amount of angular pressure on the idle stroke, although the advantage of having an almost vertical position of the connecting rod on the

power stroke was obtained, thus continuing the application of the energy to the crankpin through a slightly greater portion of the crank circle. Accordingly, about the maximum offset found in automobile engines is 25 per cent. of the length of the stroke, and the average from 10 to 15 per cent.

We are more or less familiar with the engine in question, and while we have not made any particular study of it, still we cannot see that many of the claims you mention are based on a very substantial foundation, as, for instance, the decrease in the compression with a worn cylinder. Nor that of making practicable the use of splash lubrication in horizontal engines as it is already used in thousands of engines of this type with perfect satisfaction and in which there is no offset at all. The best example of the use of an auxiliary exhaust port is also to be found in an engine which is designed without any offset. We have not taken up the claims you enumerate in consecutive order, as we do not deem them of sufficient importance. Like many manufacturers who make engines, or anything else for that matter, of a special nature, it is probable that the makers of the Ramsay are prone to exaggerate its good qualities a bit, and overlook some of its faults.

#### Altering a Runabout to Ride More Comfortably.

Editor THE AUTOMOBILE:

[834.]—Will you please answer the following through your Letters Interesting and Instructive?

My 1905 Maxwell runabout seems to ride a little roughly of late. If I were to put full elliptic springs on it both front and rear and lengthen the wheelbase by placing the front axle further forward to the extent of making it come flush with the frame end, would the benefit be sufficient to warrant making the change, and would the longer wheelbase make it harder on the hills and in mud for the engine?

In equipping gas lamps with the "Royal Multiplex" electric burner, should the distance from the lens be changed? With the above named bulb, the lamp only throws a narrow shaft of light, but it goes much further ahead than with gas.

Verona, Ill.

FRANK STERNE.

We should certainly not recommend making the radical changes to your car that you mention in your letter. The fact that the car does not seem to ride as easily as it did formerly would appear to be due to the fact, either that the old springs are worn out—that is, they have lost their life to such an extent that they no longer respond, or something may have gone wrong with their adjustment, thus preventing their proper action. It would not be an easy matter to put full elliptic springs on a car the suspension of which had originally been designed for the semi-elliptic type, without making a study of all the requirements, and the latter would doubtless be found to involve other changes than the mere installation of the springs themselves. Nor should we recommend lengthening the wheelbase in the manner mentioned, as we doubt very much if the result would be of sufficient benefit to warrant the expense. In all probability, new springs of the same type as the car now carries will probably remedy the difficulty, or it may be that, as already mentioned, the only thing necessary is a little readjustment. If the latter is not found to provide the desired remedy, we should advise consulting the makers of the car before attempting any such radical alterations as you mention.

Not being familiar with the particular lamps that you carry, nor, for that matter, with the type of burner you mention, we are hardly in a position to make a definite reply to your second question, but it is evident from the changed character of the light produced that shifting the relative positions of the burner, or bulb, and the lens, until the proper focus is found, would be likely to produce a more satisfactory result.

#### How to Measure Coil Current Consumption.

Editor THE AUTOMOBILE:

[835.]—Will you kindly give me, through your correspondence department, a method for determining, with the aid of a small voltmeter, the number of amperes used by an automobile spark coil? The particular coil I have reference to is designed to operate at six volts.

"FAULTY SPARK COIL."

The small pocket meters in general use for testing batteries are not well adapted to this purpose, as they are not calibrated on a

sufficiently fine scale to make the reading of much value. To make such a test properly a low-reading ammeter is what is required. The scale of such an instrument only reads to two amperes by tenths of an ampere, and such special meters are now being placed on the market by a few manufacturers. The method of making the test is the same in either case, the connections being as follows:

Insert the meter in the primary circuit of the coil to be tested; that is, between the battery and the coil, so that the entire current will pass directly through the meter. Start the engine or turn it over quickly by hand and the reading given by the instrument will be a close approximation to the current consumption of that particular coil. A well-made six-volt coil, such as you mention, ought to give satisfactory service on from 0.5 to 0.75 ampere, and in no case should greatly exceed one ampere, any excess over this amount being indicative of faulty adjustment of the vibrator. When the meter is connected up as already referred to, in order to make the test the vibrator should be adjusted so that the coil is not consuming more than the amount of current mentioned unless it be found that satisfactory ignition cannot be obtained except with a higher reading. Each coil should be tested separately in the same manner, this always being done with the engine running, as an idle test is very misleading. You may be able to obtain a fairly good result with the ordinary pocket meter, but we doubt it very much, as the latter is usually calibrated with a total reading of at least 25 amperes. The divisions are accordingly very fine for the units representing one ampere, and as the hand jumps every time the current is sent through it it is almost impossible to make a close test with such an instrument. This is also a disadvantage of using any meter on this work, but with the engine turning over at its normal speed the hand of a low-reading meter will fluctuate comparatively little.

#### Is a Magneto a Good Investment?

Editor THE AUTOMOBILE:

[836.]—I have been a subscriber to "The Automobile" for a number of years and think it considerably more valuable since the publication of letters and inquiries has been made a feature. I would like to have a little information with regard to magnetos.

Do they give much trouble? That is, if they receive reasonable care.

Are they satisfactory if run with a friction wheel against the flywheel, using the same timer and coil that are already on the machine, and that have been used with dry cells? Is there any way to stop the noise in new planetary gears? I am using heavy grease as a lubricant.

OLD SUBSCRIBER.

West Branch, Ia.

What you refer to in your letter is really small direct current dynamo instead of a magneto, there being considerable resemblance, however, as some of these small generators are made with a permanent horseshoe field, the same as a magneto. They are, however, equipped with a commutator and are designed to generate a direct current. They are usually found to give satisfactory service in connection with the ordinary equipment of timer and coil as employed with dry cells, but they are most largely used in connection with stationary engines where the speed is more uniform than on an automobile. They may be run by friction from the flywheel, but require a good governor to take care of the sudden and extreme fluctuations of speed. They are not magnetos in any sense of the word, as the latter produce an alternating current and are generally designed to run synchronously with the motor, only generating the current just when it is needed to fire a charge in the cylinder. They give very satisfactory service with reasonable care and are very largely used. There are also special dynamo and battery outfits on the market which give good service.

It is more or less difficult to prevent the noise caused by a planetary gear when the latter is being used on the low speed or reverse, as under such circumstances a number of small pinions are in mesh and carrying considerable load. Such a gear, however, should occasion less annoyance on this account when new, the amount of noise created increasing with its age as the pinions wear. One of the chief causes of noise is the fact that the teeth

of the pinions are poorly cut and grind against one another, this also causing a loss of power. Grease should tend to lessen this somewhat, though the makers of a small car of which thousands were turned out a few years ago recommended that nothing but comparatively thin oil be put in the case of the planetary gear. We have known of a mixture of jewelers' sawdust and heavy lubricating oil being used with excellent results in a very noisy change-speed gear of the sliding type, and it might also prove efficacious in the planetary. The use of a heavy grease or paste in such close quarters necessarily introduces greater friction, but as the low gear and reverse are used comparatively little this would hardly be any great objection if it served the purpose of lessening the noise.

#### AN ENGLISH IMPRESSION OF THE GRAND PRIX.

Editor THE AUTOMOBILE:

[837.]—My impressions of the Grand Prix are mostly centered, naturally, round the two "Weigel" cars, and I should imagine that your readers would be anxious to know what was the fate of the two English competitors.

It was hardly a lucky day for England or for the Weigel cars. But the bad luck had nothing to do with either the cars or the men who drove them. Any chance that we may have possessed for victory was utterly ruined by the detachable rims we employed, which unfortunately we had not had a chance to try or we should have found out the error of our choice long previously. They only came into our possession on the Saturday before the race, when we were in France. Immediately we tried them we knew that any chance of success with them was out of the question.

As to my general impression of the race, I think it is the finest race ever been. On the day of the race itself the organization was perfect. The rules were carried out within their meaning, leniently yet sufficiently strict, and taking into consideration the fatigue of the men. I consider the officials were just and fair to everybody, no matter what their nationality. I can hardly say as much for the day of verification. My cars were not passed until close on midnight, and to have to wait till midnight to pass the cars, and start racing a few hours afterwards is distinctly unfair to the drivers. Everything was done correctly, but it was Bediam let loose.

My impressions of the cars, borne out by the times, are distinctly that the Mercedes were the fastest on the course. Jenatz's wonderful lap proved that. The cars that gave me the best impression were the Dietrich cars, and they were unfortunate in losing. Duray's performance, in my opinion, was wonderful; he had Lancia at his mercy at the end of the first lap, and I believe could have passed him in the second one. Nazzaro's victory, in my opinion, was a piece of luck. At one time Wagner was miles ahead of him, and his other stable companions equally so.

We have been very unlucky in the Grand Prix, but we have had our lesson, and will take it to heart. Two cars will race in the Ardennes, and I believe they will be well placed. It must be taken into consideration that these are practically touring cars, being the mere coupling of two touring engines, and I have no hesitation in saying that these cars, with the exception of the three I have named, were the fastest on that course. Viewing this race as a whole, I have no hesitation in saying that France is still the center of motor car racing, and if British manufacturers wish to obtain a worldwide repute and not merely a local one they would be well advised to assist each other in entering cars for the Grand Prix, and I hope that next year there will be a good showing of English cars.

D. M. WEIGEL.

London, Eng.

#### REQUIREMENTS OF CANADIAN ENTRY.

Editor THE AUTOMOBILE:

[838.]—Referring to the letter on page 98 of the July 18 issue of "The Automobile," from "Subscriber," in reference to the conditions upon which an American car may be taken into Canada, I am enclosing herewith a letter received from the Chairman of the Touring Board, which I believe will give your "Subscriber" the information required.

F. H. ELLIOTT,

Secretary, A. A. A.

F. H. Elliott, Secretary, A. A. A.

Regarding the letter you received from the C. S. Warner Co., Niagara Falls, Canada, would say that the Warner people will bond an American car going into Canada for balance of the year 1907 for five dollars (\$5.00), and the Canadian license and markers to put on the car cost four dollars (\$4.00), so that the entire cost of passing in and out of Canada at will for the balance of this year is nine dollars (\$9.00), which is quite a substantial reduction from what it has been in the past.

FRANK B. HOWER,

Chairman, Touring Board, A. A. A.

LOCOMOBILE TYPE E, LIMOUSINE, 20-HORSEPOWER.

IN line with the policy followed by the American manufacturer to-day, the Locomobile Company of America, Bridgeport, Conn., announces the completion of its 1908 models as well as their readiness for the market, right on the heels of the closing of the 1907 season. The work of designing a new model, embodying the refined detail that the experience of the former year has suggested and the trying out of these new cars is no longer left to the close of the current manufacturing season, as was the case a few years ago. It is undertaken many months in advance, so that ever since last winter the work of building and delivering 1907 cars at the Locomobile factory has been carried on concurrently with the testing out of the 1908 models, which are now being turned out in number.

As has been the case in the past, there will be two Locomobiles for 1908, but so far as design, construction, materials and the like are concerned, both cars are practically identical. The smaller car will be known as Type E, and its rating will be the same as in previous years; that is, 20 horsepower, while the larger car, known as Type I, is equipped with a 40-horsepower motor. But, as already mentioned, the same distinctive features are common to both. While the attention of their builders is confined to these two chassis, either may be had as a runabout, touring car, limousine or landaulet, the smaller machine, Type E, also being furnished with a removable tonneau which is interchangeable with a rear deck carrying a rumble seat. All the fastenings consist of bolts and wing nuts, so that the transformation from touring car to runabout is very simple. When either type of body is in place, there is nothing to indicate that it is not permanently attached to the car, the nature of the fastening not being evident even upon inspection at close quarters.

The day when cars come forth each season in a new

guise have long since past, and now it is rather the maker who shows his faith in the system he has long adhered to by continuing it practically unchanged who begets the confidence of the purchaser, rather than the maker who is constantly striving for what are, after all, nothing more than talking points, in order to obtain public interest, so that it is now unusual to look for anything startling in the way of change on the new models of the old-established makers. Probably the greatest change to be found in the new Locomobiles is the adoption of a four-speed gear-set of the selective type on the smaller car, so that both are now uniform in this respect. A new feature of the engine is the use of a bronze plate covering a generous size opening in the cylinder heads. This communicates with the water jacket and it is designed to be utilized to give access to the latter for inspection and cleaning, the return connection of the circulating system being made through the plate. Other new features of the motor are to be found in the provision of flanges cast on the exhaust manifold, by means of which warm air is supplied to the carbureter. The latter, which is placed quite low down on the inlet

side, is practically the same as last year's model, but has been fitted with a new type of automatic air valve, while a flexible coupling has been placed on the pump-shaft to insure against binding, and facilitate the removal of the pump. The pump-shaft also carries a flange pulley for the fan-belt. To sum up, there are no sweeping changes in either model, the chief difference from the 1907 types being an increase of power on the Type I and the adoption of a four-speed gear of the selective type on the Type E in place of the three-speed progressive gear set formerly employed.

As already mentioned, both cars are so essentially alike, even in detail, that one description would apply equally well to both. The cylinders are cast in pairs and are mounted on a

REAR VIEW OF CHASSIS.

manganese bronze crankcase—a peculiarity of construction which the builders of the Locomobile were among the first to adopt and to which they have consistently adhered ever since, as the heavier metal has given perfect satisfaction in service and the net increase in weight is practically a negligible factor owing to the smaller amount necessary.

The valves are oppositely disposed and mechanically operated, the cams and camshafts being made integral, while the inlet camshaft also carries the skew cams for the make and break igniters. These cams are laid out with a profile which enables the time of ignition to be altered by shifting the camshaft longitudinally, thus causing the trip-rods to lift sooner or later, as the case may be. All operating gears are forward and are thoroughly encased in a dustproof aluminum housing bolted directly to the front end of the crankcase. An extra pinion on the inlet camshaft serves to drive the magneto, while another on the exhaust camshaft drives the centrifugal pump situated opposite.

As has been the case for the past two or three years, the ignition is of the low-tension type and in the smaller car entire dependence is placed on the magneto. To facilitate starting the larger car a set of accumulators is provided as a part of the standard equipment. Compression relief cams are also employed on the large engine and are made integral with the exhaust cams. The centrifugal governor acting upon the throttle and arranged to be cut out by the pedal accelerator is also retained. The force feed lubricator, driven by a steel belt from the exhaust camshaft, is placed directly under the footboard and is located over a part of the exhaust pipe in order to receive the benefit of the heat from the latter, the usual sight feeds being placed on the dash. A hand pump is also provided, and on the large car, Type I, 14 pints of oil are carried in a tank hung from the frame and connected directly to the lubricator, so that no oil in cans need be carried.

Probably the painstaking thoroughness with which every detail

LOCOMOBILE TYPE I, STANDARD, 123-INCH WHEELBASE.

of the manufacture of the car is looked after by its builders may best be illustrated by the lengthy process through which the piston rings are put in finishing and which gives them a fit as close as that only obtained otherwise by quite a few miles of running. To effect this, after grinding the rings are placed in a holder in the same position as they occupy

on the piston, and this is then run in a cast-iron tube of exactly the same size as the engine cylinder, the running-in process being facilitated by the use of a little abrasive.

The clutch is of the standard conical type, faced with heavy leather backed by flat springs and having the spring-thrust self-contained when the clutch is engaged. The housing of the four-speed sliding transmission is of manganese bronze, with cover plate of aluminum alloy. All shafts run on Hess-Bright ball bearings, as is also the case with the differential, bevel drive and countershaft; the direct drive is on the fourth speed. The countershaft also carries a generous-sized drum for the running brake, while the emergency brake consists of drums bolted to the rear wheels and with which the driving sprockets are made integral. Both axles are single piece I-beam drop forgings. The steering gear is of the worm and sector type and the transverse rod is placed behind the front axle. The wheelbase of the smaller car is 102 inches, or 116 inches as a limousine, while the large car in the touring car has a 123-inch wheelbase. The frame construction is noteworthy in that the rear ends of the main pressed-steel frames are connected by a steel bar passing through openings in the forgings, the

OPERATING LEVERS AND DASH.

outer ends of these bars being utilized to carry the spring shackles. At the forward end of the frame is a dropped member or cradle designed to support the radiator so that the latter is not dependent upon either of the side members of the frame for support and is thus relieved of all torsional strains ordinarily set up by the latter. In accordance with modern practice the axis of the radiator and the front axle coincide, giving an excellent weight distribution.

ADMISSION SIDE OF 40-HORSEPOWER LOCOMOBILE MOTOR.

SAME MOTOR AS VIEWED FROM THE EXHAUST SIDE.

GENERAL VIEW OF THE CHASSIS OF THE NEW SHOEMAKER CAR.

It is quite evident that the makers of the new Shoemaker car, the Shoemaker Automobile Company, Freeport, Ill., are quite confident that it is capable of putting up as creditable a performance under the most strenuous conditions as are those of far older makes and well-established reputation, as its first bid for publicity is as an entrant in the gruelling tour of the A. A. A. for the Glidden Trophy, the wearied competitors in which reached New York yesterday. For the present the makers are devoting their entire attention to the manufacture of a single type known as Model C touring car.

This is equipped with a four-cylinder motor of the standard type, the dimensions of which are 4 1-2-inch bore and 5 1-4-inch stroke, the rated output being 35-40 horsepower at a moderate normal speed. The valves are all placed on the same side and operated from the same camshaft. A noticeable departure is evident in connection with the carbureter, which is placed on a level with the top of the cylinders and is fed by gravity from an auxiliary gasoline tank placed over the motor—a feature that is of particular value in hill-climbing where a gravity system of fuel feed is employed, as it insures a constant supply to the carbureter regardless of the angle at which the car may be placed. The tank above the motor is fed by a positive plunger-pump, operated by an eccentric on the timer shaft, the pump being in communication with the main fuel tank low down at the rear of the chassis, while any excess from the carbureter itself is led directly back to this tank through a special overflow pipe. Ignition is of the high-tension type, the timer being mounted vertically directly over the flywheel and in front of the dash from which it is readily accessible by means of a removable panel placed in the latter. Lubrication

is by means of a Hill Precision oiler mounted alongside the motor while the cooling system consists of a vertical tubular radiator, the circulation being by means of a gear-driven pump, an eccentric being placed on the same shaft that drives the pump to operate the mechanical force feed oiler, while on the extreme front end of the same shaft a pulley is fixed to take the belt for the fan, this being the only accessory that is not gear driven.

The makers call particular attention to the change-speed gear, which is of the sliding type with selective form of operation, providing three speeds forward and the usual reverse, with a direct drive on the high speed. Chrome nickel steel of the highest grade is employed in all the pinions and their supporting shafts, which in turn are carried on 3 1-2-inch phosphor bronze bearings, lubricated by flooding with oil in addition to which four compression grease cups are provided, as shown in the illustration depicting the gear set and its housing. The pinions are of one-inch face and six pitch and are all thoroughly case-hardened. The cut gives some idea of the extreme of compactness the makers have attained in the design of this gear-set, which only measures 6 7-8 inches between bearings and tips the scales complete at but 55 pounds. A self-contained multiple disk clutch forms the connecting link between the change-speed gear and the motor, the latter being formed of an aluminum disk faced with cork inserts which is retained between two large cast-iron disks, supported by four substantial lugs screwed into the flywheel. The disk rotating with transmission shaft only weighs 5 1-2 pounds, thus eliminating the tendency to spin the latter and facilitating the movement of the gears. Final drive is by propeller shaft, designed to be practically a horizontal plane when running with a normal load in the car.

THE COMPACT GEAR-SET WITH ITS GREASE CUPS.

SHOWING AUXILIARY FUEL TANK AND CARBURETER.

## HOT WEATHER ACTIVITIES OF THE AUTO CLUBS

### Canadian Motoring League Becomes Active.

TORONTO, ONT., July 22.—At the last meeting of the board of directors of the Ontario Motor League it was decided to affiliate with the Royal Automobile Club of Great Britain. Official headquarters have been established in the Stair building, where the secretary will be permanently located. In connection with the office a touring bureau has been established, patterned after those maintained by American clubs, and a large file of road maps will be kept, other assistance also being rendered in the way of supplying information regarding customs and the like.

The league has adopted a comprehensive good roads policy, which, if approved by the Government, will mean the expenditure of a large sum on road improvement throughout Ontario, the plan simply being to petition the Government to grant one-half instead of one-third of the cost, as at present, under the Good Roads Act. Considerable has already been accomplished toward the betterment of the lake shore road between Toronto and Hamilton, and \$12,000 is now being raised to improve the worst stretch of six miles near here. Work was started a fortnight ago and is being pushed rapidly. The league has also completed its road guide of Canada, supplying reliable information covering 111 routes, all of which have been covered by a car in the preparation of the work.

The league has also found time to engage in other activities and last week supplied twenty-five cars for a charitable mission, by giving some seventy odd of the patients of the Home for Incurables a pleasant day's outing, the chief feature of which was a drive through High Park.

### Minnesota Auto Association's Run to Mankato.

MINNEAPOLIS, MINN., July 22.—Seventeen machines participated in the first run of the season held under the auspices of the Minnesota Automobile Association, and every one of the cars came through with flying colors from the eighty-four mile trip to Mankato, which was unanimously voted a huge success by all concerned. It had been originally planned for a fortnight earlier, but was postponed owing to the bad condition of the roads. The sole object of the jaunt was the opening of the active campaign for good roads, which Minnesota autoists are now undertaking. On arriving at Mankato, the association members held a business meeting at which the subjects of good roads, signs, road maps, legislation and the holding of a race meet in connection with the Minnesota State Fair in September were discussed at length. It was voted to offer \$5,000 in prizes for the races, which will be divided into three general classes, for professionals, dealers and amateurs, in addition to which there will be three classes adopted from the American Automobile Association's horsepower standard instead of by a price limit. The star features will be a free-for-all at fifty miles and a twenty-five-mile event in three classes, for which a \$1,000 purse is to be hung up.

### Bronxville Has a New Automobile Club.

NEW YORK, July 23.—As the result of the efforts of F. H. Elliott, secretary of the American Automobile Association, Bronxville, New York, now has an automobile club, which takes its title from the name of the town. H. Ward Leonard, one of the pioneer members of the Automobile Club of America, was elected president; Frederick P. Ackermann, vice-president, and Harry Burt, secretary and treasurer. J. J. Lannin, proprietor of the Gramatan Inn, was one of the organizers, and the new Bronxville Automobile Club will probably make its quarters temporarily at the inn. The club starts with quite a number of charter members, at least twenty-five of whom are at present owners of cars, while the remainder are prospective purchasers.

### New York Auto Club Meets and Elects Officers.

A special meeting of the New York Automobile Club, until recently the City and Country Motor Club, was called at the town club headquarters, 306 West 109th street, on Thursday last, at which the following officers and directors were chosen for the ensuing year: Dr. Edgar T. Weed, president; Andrew J. Cobe, vice-president; James Stuart Blackton, treasurer; I. E. Roskam, secretary; directors, Commander U. J. Sears, U. S. N., Edwin Churchman, Bart G. Faulhaber, Samuel T. Myer, C. Ledgwick Levy, David C. Goodman, Conrad Hubert, Elbridge G. Snow, W. Woods, David J. Power, Samuel Steinfield and the officers.

A committee was appointed to make arrangements for a road run as well as several races for the Quinn trophy. Application has been made to Secretary Elliott for admission to the American Automobile Association, and also to the New York State Automobile Association. It is expected that favorable action will be taken on the former at the next meeting of the A. A. A.

### Kansas Division, A. M. L., to Hold Meet on Labor Day.

LINDSBURG, KAN., July 22.—At the meeting of the executive committee of the Kansas Division of the American Motor League, recently held in Topeka, plans were made for the holding of the annual meet, which will take place at Lawrence, Kan., on Monday, September 2, Labor Day. The events will be confined to gymkhana "stunts" and probably a hill climb. The members present at the meeting were: A. E. Agrelius, Lindsburg, who is chief consul for Kansas; G. L. Knight, Lawrence; James G. Blaine, Pratt; George W. Crane, Arthur Capper and George W. Stansfield, Topeka. The Topeka and Kansas City divisions are expected to send at least fifty cars each to the races, and it is thought that with favorable weather there will be a representative gathering of autoists from all parts of the State.

### A. C. of Germantown Holds Its Annual Meeting.

PHILADELPHIA, July 22.—At the annual meeting of the Automobile Club of Germantown last week the following officers were elected: Thomas B. Prosser, president; Charles H. Thompson, vice-president; Mark B. Reeves, secretary; Robert P. Hooper, treasurer. The following board of governors was also elected: John D. McIlhenny, S. B. Ferguson, William F. Helme, Prescott Adamson, Robert P. Hooper, Clarence B. Collier, Harry K. Duffus, Mark B. Reeves and G. Dunbar Shewell. President Prosser named the following finance committee: S. B. Ferguson, chairman; Charles H. Thompson, Clarence B. Collier and Robert P. Hooper. The club now has a membership of 162.

### Clevelanders' Sealed Bonnet, Utility and Efficiency Trials.

CLEVELAND, O., July 22.—The Cleveland Automobile Club will hold a series of contests shortly, all of which will be run during the latter part of August. There will be a sealed bonnet contest for gasoline and steam machines, a utility test for commercial vehicles and an efficiency trial for electric cars. George H. Bowler will be in charge and data relating to these contests may be obtained by addressing him at the club. It is proposed to make a national event of these trials and numerous promises of entries have been received from all parts of the country.

### Maryland Club Acquires Permanent Quarters.

CARONSVILLE, MD., July 22.—The recently organized Automobile and Driving Club of this city has just leased the Yearley property on Wilkins avenue for club purposes and will remodel the old mansion and improve the grounds, making an up-to-date clubhouse of the former.

**Successful Termination of the A. A. A.'s 1907 Tour.** Whatever may be the decision of the judges in awarding the Glidden and Hower trophies, that of the competitors and of the industry at large must be to the effect that the event just closed has been the most successful of its kind. Were it not for the unfortunate mishap and its fatal termination that marked the second day of the run, there would not be a blemish to mar its success as a whole. Of course, there will be dissenting voices from this dictum, and such a state of affairs is inevitable. Circumstances are bound to arise that make it not alone expedient, but render it imperative, for those in charge to subordinate the personal convenience or individual welfare of some of the competitors to that of the general good, and, under the stress of trying to attend to every one of the thousand details that arise on such occasions, personal wants and personal appeals for aid may not receive that prompt and painstaking attention that the applicant generally thinks the dignity of his position warrants.

With the injustice of a fancied grievance rankling in their minds, it will naturally be impossible for some of the competitors to view the tour in the same impartial light as becomes the disinterested observer. That is, not at the present. Time wipes away the taint of petty annoyance, and then we are able to take a broader view of what was at the moment overshadowed by personal bias. And viewed from this standpoint, the tour must be conceded to have been a great success. Not that it was perfect, by any means; hotel accommodations might have been better, rules and regulations might have been improved, and there were a dozen

and one things that doubtless each one of the competitors thought he could have done better had he been in charge; but above all this stands out to the credit of those who did the work that it was carried out *far better* than it has been in any previous year, and as a result the 1907 tour marks a closer approach to the fulfillment of the purpose for which it was instituted than has previously been the case. Considered as a whole, the performance of the cars is highly creditable to the American automobile and the American industry.

**Does Thirty-six Inches Represent the Wheel Limit?** It is now a little more than two years since the tire-maker succeeded in convincing the automobile manufacturer and the autoing public in general that large wheels were of necessity the first step toward the solution of the tire problem, which was at that time far more pressing than it has been since, due to the adoption of the suggestion of those who were in an excellent position to know. In fact, the advance in size has been so general that it is not difficult to determine a car's age by the size of its wheels, few of the heavier cars now carrying anything less than 36-inch rolling supports, while there has been an almost universal advance to 34 inches on the part of the makers of lighter cars. The change has been so uniform that the question naturally arises: Is 36 inches the limit in this direction? and it is rather apropos at the moment, in view of the announcement by its maker that one of the low-priced two-cylinder cars for 1908 is fitted with 36-inch wheels.

The man who pays a high price for his machine looks for features that are lacking on lower-priced constructions, and the maker usually responds to this demand. Will this alone be sufficient incentive for the builders of expensive cars to make a still further increase in wheel sizes? The question is wholly one of cost. Rubber costs more to-day than it ever did, and skilled labor is still an expensive commodity, while the increase in the cost of making such tires would probably not be entirely proportionate to the difference in size, but would be apt to be greater. With the greatly increased manufacturing costs that characterize the production of the modern automobile, due to the vastly better grade of materials used in its construction, there can be little doubt that the manufacturer is not anxiously seeking means to cut down his profits by the adoption of such a substantial percentage of increased cost as would be involved in tires of a larger size, say 38 inches. There is another equally important side to the question: Would the autoist care to foot the bills for replacing such tires and deem himself better off in the end, in view of the improved service they would render?

**New Jersey Repudiates the Vanderbilt Race.** With characteristic short-sightedness the aptly-named "foreign land" on the west bank of the Hudson has decided that it will have none of automobile racing. The bill rushed through the lower house is constitutionally defective and Governor Stokes, who has had his ear to the ground since first lending enthusiastic support to the proposed holding of the Vanderbilt Cup Race, has detected an ominous rumble, and now says nay most emphatically—he never even thought of such a thing.

Through his own carelessness one of Jersey's citizens met his death on Long Island last year. The spectators were so utterly oblivious to their own safety that the marvel is more did not meet the same fate. But that says nothing against automobile road-racing, which as a sport has proved not a whit more dangerous than many another. Scores of people have met their deaths watching a well-ordered baseball game, but on one has denounced it as a crime against society, and the same is true of yacht racing, which can show a long list of fatalities. New Jersey has distinguished itself in other ways by its mediæval attempts to repress the automobile, so that the spirit manifested on the present occasion is not surprising, while the Jersey conception of a racing car as a man-eating monster is ludicrous.

**BOSTON AUTOISTS TO CELEBRATE HOME WEEK.**

BOSTON, July 20.—The executive committee of local automobilists, which is in charge of the automobile features of Boston's Old Home week celebration, July 28 to August 3, has about completed the program for "Automobile Day," which will be Thursday, August 1. Circulars will shortly be sent out to the automobilists of the city and vicinity asking them to participate in the automobile tournament, which will include a parade through the streets of the city and gymkhana events on Boston Common.

When the subject was first broached it was suggested that a road race or a hill climb, or both, would be interesting to the visitors as well as the inhabitants of the city. Owing to the great crowds that are expected the committee at once discarded the race proposition. The hill climb was also abandoned on account of the crowds, and because no suitable hill is available within easy reach of the center of the city. All efforts, therefore, will be concentrated upon the parade and the gymkhana games. J. H. MacAlman, manager of the Columbia branch, and president of the Dealers' Association, is chairman of the parade committee, while K. M. Blake, manager of the Locomobile branch, is chairman of the committee on Gymkhana games; F. A. Hinchcliffe, of the Winton branch, is treasurer of the executive committee, and Chester I. Campbell is chairman.

Those in general charge of the Old Home week celebration appropriated \$1,000 for the use of the committee, and with this money prizes will be purchased which will be awarded both to parade and to Gymkhana contestants. In the parade five prizes will be offered as follows: for the best appointed touring car, the best appointed runabout, the best appointed car driven by a lady with lady passengers, the best decorated car and the most grotesque car. The parade will be a short one, and, though the route has not been decided upon, probably will cover some of the down-town streets as well as Back Bay and park roads. It will assemble about 11 o'clock A.M. Thursday, and will finish at the Common in time for the Gymkhana events.

In the gymkhana events, which will be of the usual order of such sports, prizes will be offered. In both parade and gymkhana every effort is being made to interest private owners, so that there will be a large number of entries. It is hoped to make the parade the largest ever held in New England, if not in the country. The committee points out that the parade gives an excellent opportunity to show the extent of the local industry.

**MADISON, CONN., STARTS A TRAPPING GAME.**

"Kindly warn your readers that a trap is being maintained in Madison to catch the unwary," writes Walter S. Schutz, one of the Hartford attorneys who was largely responsible for the new Connecticut law recently enacted. "I defended one case there last Saturday, and though the evidence of the prosecution was extremely slim, my client was convicted and fined \$50 and costs. An appeal has been taken to the Superior Court, and we mean to see it through. Several courses purporting to be 1,400 feet in length have been measured off in the town, and the local constables and similar highwaymen are stationed behind stone walls on Sundays and holidays, ready to trap anyone who goes more than twenty miles an hour."

**CHICAGO TO HAVE ANOTHER TWENTY-FOUR.**

CHICAGO, July 22.—Walter White's challenge to C. A. Coey, winner of the recent 24-hour race at the Harlem track, for a similar event between a White steamer and Coey's Thomas, having been accepted, Labor Day will see a repetition of the round-the-clock grind that was part of the entertainment planned for the A. A. A. tourists. The event is to be started at 5 P.M. Sunday in order to finish at the same time on Labor Day, and it is said Coey will wager \$2,000 on his chances, while the backers of the White will post a side bet of \$1,000 on the result. The course will be specially prepared for the star event which will be preceded and followed by short distance races.

**QUAKER CLUB TO SUPPRESS BUCOLIC GRAFTING.**

PHILADELPHIA, July 22.—Driven to desperation by the high-handed manner in which the rural authorities are mulcting good and bad alike, the Quaker City Motor Club has undertaken an active campaign for the suppression of this type of blackmail and intends to put an effective quietus upon it. Headquarters have been established at the Hotel Majestic, and immediately upon traps being reported warning signs are posted. The victims of hold-ups are urged to refuse to pay fines, even at some personal inconvenience, the cases being defended by the club's attorneys. The Pennsylvania law requires the horn to be sounded at all crossroads and an alleged failure to do so is now the most usual pretext on which parties are apprehended, as the majority now very disobligingly refuse to drive fast through the traps. The club has issued instructions in which autoists are warned to keep within the 20-mile limit and to sound the horn at the slightest provocation, winding up with "when arrested, turn your case over to the club's attorneys."

Interesting developments have also taken place recently in the toll road situation. The Montgomery pike parallels the Lancaster pike, and the former has been collecting but three cents a mile to the latter's five, so that the former decided to get some of the easy money, and jumped the rate from the city line to Bryn Mawr from 15 to 34 cents for a touring car, the Lancaster rate being 26 cents. But local autoists who know all the ins and outs have stirred themselves to activity by publishing maps in all the local dailies, showing how the majority of the toll gates can be circumvented, and the toll roads are taking in less money than ever.

**PLACING A BAN ON THE RECKLESS DRIVER.**

BOSTON, July 20.—The Safe Roads Automobile Association, an organization recently formed in this city for the purpose of preventing the improper use of automobiles and prosecuting reckless drivers and those who do not obey the law and the rules of the road, is conducting a very active campaign, and has already made its influence felt by securing the revocation of several licenses and registrations by the Highway Commission. The Association is composed largely of private owners of automobiles, and it employs agents whose duty it is to investigate cases of reckless driving that may come to the attention of the association, collect evidence, and prosecute the cases. The association justifies its existence by pointing out that in a period of twenty-six days ending July 10, there were ninety-two accidents in Massachusetts in which automobiles were involved; forty-three pedestrians were injured, and there were forty-nine collisions between automobiles. Nine people have been killed and thirty-four injured. To aid in its work the association has just made an offer of \$50 reward for evidence which shall lead to a conviction in cases of infraction of the automobile law.

**ALGONQUIN HILL-CLIMB SET FOR AUGUST 9.**

CHICAGO, July 22.—Owing to the fact that the tour of the American Automobile Association for the Glidden trophy interfered with the date originally set for the annual hill climb of the Chicago Motor Club and the Chicago Automobile Trade Association, it has been postponed until Friday, August 9, on which date it will be contested at Algonquin, Ill. This action was taken at a meeting of the committee, consisting of Charles P. Root, F. W. Cornish, H. P. Branstetter, B. C. Buxton and J. V. Lawrence.

One more event was added, a free-for-all, which will allow of the competition of steamers. The basis of classification also was changed. The cars will be classified according to piston area instead of price. In the first five events only gasoline cars will contest.

In the free-for-all the winner will be the car making the fastest time, but in the other events the cylinder capacity of the car, multiplied by the time in seconds, divided by the weight of car with driver, will be the basis of competition, this rating having been adopted with a view to reaching a more equitable result.

**BROOKLANDS MEET PROVIDES TAME SPORT.**

LONDON, July 8.—The first race meet at Brooklands has hardly proved the big success anticipated and big alterations will have to be made in future events to sustain public interest. All the elements of success were present at Saturday's meeting—a representative collection of cars, good weather and a perfect track—but the easy wins together with the withholding of times in order to enable the committee to frame future handicaps greatly bored the spectators once the novelty had worn off. The attendance was itself below expectations. But 14,000 turned up for this opening meet, and it will be necessary for this to be increased in future if the track is to pay. The members' and £1 inclosure contained a select gathering of society notabilities and no less an accession to the sport of motor racing was to be found in the humble half-crown section, where the horsey betting men warily laid the odds against the favorites.

The very magnitude of the track prevents success from a spectacular point of view; it is impossible to see the whole run distinctly, and if close sight of the fast swing round the banked curves is desired, view cannot then be had of the finishing straight. Add to this complaint the fact that the cars were insufficiently numbered and that the vari-colored umbrella coats of the drivers—in most approved jockey style—proved impossible of easy recognition, and it will be seen that the universal grumble was well justified. Unofficial timing on Saturday showed that speeds of well over ninety miles an hour were reached, yet at no time did the apparent gait reach a mile-a-minute standard—to such an extent did the huge size of the track dwarf speed by comparison with the flying spots on it.

The first race failed to arouse much excitement, after two preliminary heats the final of the Marcel Renault Memorial Plate of £550 being won by the 40-horsepower Napier. Excitement was soon warmed up in the 15-mile run for the Gottlieb Daimler Memorial Plate of £650, the limiting engine dimensions being 120 to 135, based on the new formula adopted by the Royal Automobile Club recently. The two Daimlers had an easy run for first and third places, Huntley Walker coming second on a Darracq after three of the other competitors had been eliminated by accidents, including a broken valve on the Minerva, water shortage on the Napier and a loose bonnet that flooded Sangster's face with oil on the Ariel. The excitement aroused by this event culminated with a magnificent finish of the race for the Byfleet Plate of £550. Before half of the ten miles had been covered, the race resolved itself into a neck-and-neck contest between Jarrott's De Dietrich racer and the stripped Napier driven by Newton. For the whole of a three-mile lap the two cars remained wheel to wheel until the finishing straight was reached. Jarrott gained about ten yards, but when just on the line the Napier seemed to make a leap forward and the judges gave the result as a dead heat, rather an unexpected decision for such a high-speed event. Huntley Walker came in third on another of his innumerable Darracqs.

For the Montague cup for the high stake of £2,100 both Nazzaro and Duray were booked to appear and their absence caused much disappointment. Hutton's 120 Mercedes was placed first, with Okura, a Japanese motorist, second on a 100-horsepower Fiat. The final event was run on a price basis, cars listed at £600 to £700 racing for the Stephenson cup over a distance of two laps or six miles. Huntley Walker's Darracq this time managed to come in first with the Marquis de Saint Mars at the wheel; Sangster's Ariel took second place.

**ONTARIO TOWN TO HAVE A 'BUS LINE.**

STRATFORD, ONT., July 22.—A project to operate an automobile 'bus service here is already well developed. Three cars will be employed for passenger service, each having a carrying capacity of 12 to 20 passengers, and will be run regularly for a five-cent fare over any part of their route. Other cars will be employed to carry factory operatives to and from the plants in the suburbs, and will be rented during the afternoons for parties.

**LONGMEADOW A FIT SUCCESSOR FOR LEICESTER.**

SPRINGFIELD, MASS., July 22.—It would appear as if the mantle shed by Barber Quinn, of Leicester, who made the name of that town a stench in the nostrils of autoists throughout the East, has fallen upon the shoulders of one Henrattie, an ex-brakeman of a freight train who was recently appointed a special officer at Longmeadow, a hamlet just to the south of here. With the usual equipment of a cheap stop-watch he has marked out an appropriate scene of operations and is hard at work. His prey is haled to the Springfield police court and it is said that the records show no instance of an acquittal, despite the fact that this modern Dick Turpin has testified to performing such fantastic tricks as catching an automobile by "jumping onto the rear hub and from there to the running-board" while it was going 34 miles an hour, bearing witness to such performances with no little pride. A Springfield autoist has offered \$50 for a repetition of the performance provided he be not saddled with funeral or other incidental expenses, but there has been no attempt to lift the purse so far.

The Springfield Automobile Association posted a number of warning signs, but the selectmen did not appreciate this interference with the business of trapping and had them removed, beside publicly approving of the conduct of their chief trapper, stating that they are "pleased with the officer's success." The matter is assuming the proportions of a public scandal, for, in addition to the marvelous feats of the man who can keep his eye on a car and the stop watch at the same time, snap the latter when the car passes and then sprint after it, the action of the police judges is far worse, as they fine defendants even when the latter testify to having been warned of the trap and were going slowly, beside which they are subjected to abuse and vituperation by the attorneys for the prosecution in their cross-examination.

**TOLEDO AND VICINITY IN A BROIL.**

TOLEDO, O., July 22.—This town is in a state bordering on anarchy where automobile laws are concerned and the city council is in a quandary. Not long ago the special motorcycle policemen detailed to see that the mile-in-six-minutes ordinance was not violated reported that it was impossible to do so unless every machine carried a license tag. The council moved, passed the required ordinance and purchased 500 tags. There were not enough to go round by several hundred, so that the law cannot be enforced any better now than before, and considerable red tape must be unwound before the remaining tags can be provided. The situation is further complicated by the practice some have started of turning the tags upside down, and several are said to have escaped arrest in this way. Another law provides against the driving of cars by persons under 15 years of age, but it is a dead letter and is violated daily.

Outside of Toledo the farmers appear to have declared open war on the automobile, their hatred taking the form of dangerous obstructions, log barriers and the like placed in dark spots on the roads, which have resulted in numerous accidents and frequent narrow escapes. It is little short of marvelous that no fatalities have been reported on this account, as the barriers have been placed with every evidence of the most diabolic ingenuity in concealing them that could be expected of a train wrecker.

**DALLAS THINKS EIGHT MILES FAST ENOUGH.**

DALLAS, TEX., July 20.—This city is being governed by a commission nowadays in place of its former mayor and council, and in order to demonstrate to the new governing body just what traveling at eight miles an hour in an automobile means, all five of the commissioners were taken riding by autoists recently, the purpose also being to demonstrate the poor condition of the streets, which are extremely hard on a car.

But the trial did not have the desired effect, as after it was over Commissioner Doran observed, "I believe eight miles an hour downtown, and a *little faster possibly* out in thinly settled and traveled streets would be about right for the speed limit."

**PUTTING MASSACHUSETTS' LAW INTO EFFECT.**

BOSTON, July 22.—The Massachusetts Highway Commission this week enters upon the arduous task of reregistering all of the automobiles in the State in accordance with the law passed by the last Legislature. This provides that the registrations of all automobiles in the State shall expire on August 1, and that to renew them until January 1, 1908, shall cost \$5, and that the registration fee thereafter shall be \$5 annually for automobiles and \$2 for motor cycles. It is estimated that there are in use something like 15,000 automobiles and 500 motor cycles, and to reregister all these the Highway Commission has been obliged to secure a much larger force of clerks, and will go to an expense estimated roughly at \$5,000 during the next two or three weeks.

The individual owners will be inconvenienced as little as possible, as they will be permitted to retain their old number plates and registration numbers. Each owner of a car will receive a bundle of documents from the commission. These he is expected to read, and there are also blanks for him to fill in. The blanks are to be returned to the Commission with the amount of the fee, and a new certificate of registration will then be issued. The work probably will not be finished until after August 1, so the commission is trusting to the discretion of the police in holding up cars for a week or two.

It is estimated that the registration this summer will bring in to the State's coffers a total of \$84,000 in fees, and on January 1 next there will be another \$84,000 or more, providing \$168,000 as a road fund. Three-fourths of this is to go for State roads and the other fourth for the upkeep of the parkways and boulevards of the Metropolitan Park Commission.

**CONTINENTAL CLUBS TO ADOPT RULES.**

PARIS, July 16.—With a view to coming to some agreement regarding a standard code of regulations to govern automobile racing all over the world, representatives of English, French, American, Dutch, Belgian, Austrian, Italian, Swiss, Hungarian and German clubs are to meet at Ostend to-day. Some of the delegations have made known in advance the stand they wish to advocate, Italy favoring the elimination of a horsepower standard and desiring the privilege of optional weights. A difference of opinion exists between the general committee and the racing committee of the A. C. F., the former favoring four-cylinder cars having a minimum bore of 160 mm. and a minimum weight of 1,108 kilos, while Marquis De Dion, of the racing committee, who is one of the delegates, proposes a minimum weight of 1,300 kilos and a minimum fuel consumption of 20 liters per 100 kilometers.

**GERMANY TO INSTITUTE A NEW CLASSIC.**

LONDON, July 16.—As is well known, the rules under which the Herkomer Trophy is competed for call for the holding of that event in England for the next three years, so that there is already considerable talk in German automobiling circles of instituting another event to be held at home next year. Nothing definite has come to light as yet, but it is reported that Prince Henry of Prussia will donate a trophy and the event will be placed on an international basis, part of the route being laid in Austria. Miss Dorothy Levitt, who received a gold plaque for her driving in the last Herkomer tour, expects to give an exhibition of her skill on the Florida beach next winter. According to present reports, the running of the tour this year shows a substantial profit.

**MOTOR BOAT RACE FOR THE COUPE DE PARIS.**

PARIS, July 21.—The high speed attained by the gliding boats was the feature of the "Paris à la mer" motorboat race, which started from Auteuil bridge this morning. The race to Suresnes lock for the Coupe de Paris was easily won by the Panhard-Tellier, the Rapiere being second and the Lorraine-Dietrich third. Pournier handled the Itala II. and Perignon steered the Dietrich.

**NEW BOOKS PERTAINING TO AUTOMOBILING.**

**Motoring in Fiction.**—A new automobile romance by C. N. and A. M. Williamson, has appeared in the July issue of *Lippincott's Magazine*. It is entitled, "He Who Stole and Rode Away." The hero, Captain Laurence O'Hagen, late of the British army, finds himself in such an extraordinary position that he is obliged to run away with another man's automobile. The heroine is Mona Eversleigh, a young heiress whom a pair of titled Australians are seeking to entrap into a marriage whereby they can get control of her fortune. It is the kind of story in which there is "something doing" on every page.

**Touring Club of Italy's Road Book.**—Remarkably good work is being done by the Touring Club of Italy in the publication of information on touring conditions in that country, the efforts of the past few years having made Italy only second to France for convenient touring. In their *Annuario dell' Automobilismo, 1907*, just published, the tourist has a complete guide in Italian to regulations, laws, taxes and routes in Italy and a number of other European countries. The new volume contains maps of all the race circuits in Europe, with large colored maps showing how to reach them from distant points. The book, which has more than seven hundred pages, is published by the Touring Club of Italy, 14, Via Monte Napoleone, Milan.

**A Book of Foreign Wanderings.**—Francis Miltoun's "The Automobilst Abroad," just from the press of L. C. Page & Company, Boston, will please in proportion as the reader has become imbued with the dilettante automobile spirit. Certainly the speed maniac who retires disgusted when road or mechanical conditions prevent the addition of another figure to his best record will have little sympathy with the work; nor is the inquisitive statistical and historical-bloated traveler likely to find the tone altogether sympathetic. But the man who experiences a real joy in studying the moods of an engine, who can appreciate good roads and take bad ones stoically when they come, who likes to linger over well-supplied tables and sip the best wines of the country of his temporary adoption will find the perusal of the book a real pleasure.

Abroad to Francis Miltoun practically means France—the Elysium of the motorist. Through smiling Touraine, around romantic Carcassonne, the wildness of the Pyrenees, in Languedoc and Old Provence, along the banks of the turgid Rhone, or through the more sober but no less interesting Seine and Oise, the writer leads his guests, picking out resting places that he would fain never leave, giving pictures of old world customs untarnished by modernity and supplying useful touring hints as far removed from the stereotyped guide book as it is possible to imagine. The land of dykes and windmills, the roads by the Rhine, the stretches of pavé in Flanders, as well as that cyclist-auto pilgrimage from Land's End to John O'Groats form a part of the travels of the automobilst abroad; but it is evident that Francis Miltoun is more at home in the land of the tricolor, and whenever absent hankers after its unique conditions. There are interesting chats on an "Appreciation of the Automobile," "Roads and Routes," "Hotels and Things." A number of colored plates and half-tone illustrations embellish the volume.

**AN ECHO OF ORPHANS' DAY FROM THE WEST.**

SPRINGFIELD, ILL., July 22.—The Sangamo Club of this city may have been somewhat belated in celebrating orphans' day, but the fifty-three waifs from the local Home for the Friendless who were given the treat lost nothing by waiting, as the aristocratic members of the club did the thing up in style. They were given a ride about the city in the cars, then taken to the Country Club, where they were feasted, topping the good time off with a visit to the White City. Twelve cars were in the procession and part of the route lay through Washington Park.

AN OHIO FRANKLIN AGENT AND HIS SIX-CYLINDER CAR.

In the tonneau are Chief Justice Day's daughter and son, Mrs. James Kimbark, wife of the treasurer of the Timken Roller-Bearing Axle Company, Miss Daisy Trout, and Mrs. R. J. Diebold. In the front are R. J. Diebold, the Canton, O., agent for the Franklin, and Dilbert Warder, driver for H. H. Timken.

### HOT WEATHER NEWS FROM THE QUAKER CITY.

PHILADELPHIA, July 22.—As chairman of the contest committee of the Quaker City Motor Club, E. C. Johnson is very well known locally, but it was through his assistant managership of the local White branch house that he had attained fame. Indeed, Johnson and White had become synonymous terms. Imagine the surprise of the local automobile world last week when the announcement was made that Johnson had renounced steam and all its works and had taken up gasoline as exemplified by the Keystone Motor Car Company, which handles the Packard here. The same company also represents the Buick locally, and has secured "Eddie" Wilkie, formerly of the Spencer-Wilkie Company, to take care of that branch of its business.

Four business days were practically chopped out of the calendar of the "Row" establishments last week. The big reunion of the Elks and the parades through the Court of Honor in front of their places of business drew such crowds that the police officials ordered vehicles of all kinds off Broad street from 7 A. M. to 11 P. M., much to the detriment of demonstrations. Many of the dealers returned good for evil by loaning one or more cars to the Elks Entertainment Committee for the entire week. These machines were used mainly for sightseeing tours.

Oshkosh, Wis.—Preparations have commenced for the erection of a modern garage for the Krueger Automobile Company on Jefferson avenue and Merritt street. Dimensions are 112 by 55 feet, the building to consist of three stories.

### A PROSPEROUS SEASON FOR DETROIT'S TRADE.

DETROIT, MICH., July 22.—That the present season has been the most successful in the history of the industry for Detroit and Michigan makers of automobiles and accessories is universally conceded. Backward weather and the slump in Wall Street had a tendency for a time to beget pessimism, but the clouds have rolled away and a glance back over the past twelve months indicates a gratifying condition of affairs.

A careful canvass discloses some interesting facts regarding the growth of the industry and the imposing proportions attained. During the season practically closed there were made in twenty factories in Detroit and Michigan not less than 21,500 automobiles, ranging all the way from runabouts to five-ton trucks, although the commercial vehicles cut a small figure numerically. The selling value of these cars on a conservative basis totals, approximately, \$32,000,000.

Of this number Detroit produced more than 12,000, the rest being divided among seven factories throughout the State. The total value of Detroit's production was \$17,000,000 or approximately 60 per cent.

One year ago there were engaged in Detroit factories devoted exclusively to the manufacture of automobiles 3,500 skilled mechanics. Within the past twelve months this number has been increased to 5,000. Just how many are employed in the factories outside of Detroit cannot be determined, but they number thousands. On a conservative estimate, not less than \$10,000 is paid out daily in wages to toilers in Detroit auto factories.

But this is only part of the story. Detroit is recognized as one of the greatest centers in the country for makers of parts and accessories. In this line, including the production of tires, of itself an item of importance, not less than 5,000 persons are employed. Taking the same average wage as prevails in the automobile industry, it will be seen that another \$10,000 is disbursed daily. Combining these two, \$20,000 is put into circulation in wages alone every day during the busy season, and this means practically the entire twelve months just closed. Added to this is the amount paid out for similar purposes in factories outside of Detroit, bringing the total for the year in wages alone well up toward the ten million mark.

It is interesting to note that three concerns produced more than one-half Detroit's entire output, three more out in the State furnishing 80 per cent. of the 9,500 contributed by the State.

At least four Detroit concerns did an aggregate business in excess of a million dollars, two approaching the \$5,000,000 mark. Five out of seven scattered through Michigan also exceeded the million dollar mark, one reaching \$5,000,000 and two others getting past \$3,000,000.

With the tag ends of last year's business out of the way, most of the local concerns are already busy with plans for the coming season. The Packard Company has had its 1908 model out for some time, and several others are nearing completion, everything pointing to an earlier start than has been customary in the past.

THE CLUBHOUSE AT DEL MONTE, CAL., ON THE OCCASION OF THE SECOND ANNUAL LUNCHEON AT THE RECENT MITCHELL MEET.

INLET SIDE OF THE NEW WAUKESHA MOTOR.

### NEW MODELS OF WAUKESHA MOTORS FOR 1908.

In bringing out its line of motors for the season of 1908, the Waukesha Motor Company, Waukesha, Wis., have made a self-contained system of lubrication a feature of the  $4\frac{1}{2} \times 5$  and the  $4\frac{3}{4} \times 5$ -inch sizes, in response to the general demand. These motors are of the well-known Renault type, and embody all the best features of design consistent with practical simplicity. The cylinders are cast in pairs with all the valves on one side, while the cooling-water circulation enters just below the valves and leaves through a brass manifold running along the top of the cylinder heads, the valves thus being amply water-jacketed. The cylinders are ground to exact size, and the pistons, of the same grade of iron as the cylinders, are provided with four compression rings, split diagonally and ground to 4-1000 undersize at the bottom and 6-1000 at the top. The brass water pump is of the centrifugal type and is driven from the same shaft as the magneto, while a timer for battery ignition is placed vertically at the flywheel end of the motor and driven by the camshaft through hardened steel miter gears, encased and running in oil.

From the same shaft a small oil pump, forming the chief feature of the lubricating system, is driven, oil being constantly pumped from an oil-well below the crankcase to the main bearings and cylinders, thence draining to the crankcase oil-pan, where it is utilized for splash lubrication, constant-level drain holes being provided to take care of any excess and conducting the latter directly back to the special oil chamber beneath. A straining and filtering device is fitted between the pump and crankcase, and is easily removable for cleaning, while the pump itself and the small amount of piping necessary are both on the outside of the crankcase in an accessible position, so that the system is extremely simple and reliable, it only being necessary to maintain the supply in the oil chamber. High-tension ignition is employed, the valve-chamber plugs being tapped for standard  $\frac{1}{8}$ -inch plugs, while provision is made for any standard magneto.

From the foregoing, as well as the following specifications, it will be evident that the design of these motors is the result of long experience in this field and that nothing has been omitted to make them represent as close-cut and compact unit power plants as are obtainable on the market. Both the connecting rods and the crankshaft are drop forgings, the latter being of .45 per cent. carbon steel, while the split bearings of the former are bushed with Parson's white bronze, the dimensions of these main bearings being  $1\frac{3}{4}$  inches in diameter by 3 inches in length. The piston pin is hollow, and measures  $1\frac{1}{4}$  inches in diameter externally and  $\frac{3}{4}$  inch internally. It is hardened and ground, and gives 4 square inches of bearing surface on the piston lugs. The crankshaft is offset 1 inch from the axis of the cylinders, and it is forged integral with a flange to take the flywheel, the latter being finished all over and assembled with the crankshaft. All the connecting rods and all the pistons are made of exactly the same weight, thus giving perfect mechanical balance.

### KNOX COMPANY TO INCREASE ITS CAPITAL.

SPRINGFIELD, MASS., July 22.—As a preliminary step in a plan looking to an increase in the capital of the Knox Automobile Company, and as a means of forestalling any ill-advised or hasty action by a large creditor, the latter to-day made a voluntary assignment for the benefit of its creditors, Alfred N. Mayo being appointed trustee. The position of the company and its reasons for taking the step are fully explained in the statement made public by President E. H. Cutler, which is as follows:

The Knox Automobile Company, having found itself embarrassed by lack of ready money and having consulted some of its larger creditors, has upon their recommendation made an assignment for the benefit of all creditors to Alfred N. Mayo, of Springfield, and it is expected the company will continue its business by securing additional working capital. The company has this year done an increased and profitable business, and its product is remarkably successful. The difficulty is due largely to the fact that the capital is too small to handle the large business under present conditions. The inventory just taken shows that the assets are nearly double the liabilities, and sales this year have been larger than the previous year, but, owing to the exceptionally bad spring weather, they have been smaller than was expected. With a splendid car, increasing business and a surplus, together with a reputation for good workmanship and fair dealing which has earned the goodwill of both its customers and creditors, it would seem that the plans already on foot for reorganization with largely increased capital cannot fail to succeed and that there will be practically no interruption of business.

### FIRST RAMBLER MODELS FOR 1908.

Soon the whole fleet of new Ramblers of all sizes and types for 1908 will be in the hands of the Rambler agents and branch houses, the Model 31, which is the two-cylinder representative, or at least one of them for 1908, being the first to put in an appearance. The differences between it and Model 21, which was its 1907 predecessor, are slight. The controlling devices are now placed over the steering wheel in response to the general demand, the forward portion of the footboard has been given more of a slant and the rake of the steering wheel has been increased somewhat, while the pedals are so arranged that there is no possibility of dirt finding its way through the floor. The most important change is to be found in the adoption of 36-inch wheels, shod with 3 1-2-inch tires front and rear, the power plant being practically identical with this year's machine, except for a slight improvement in the valve-operating mechanism. Though the new model has been put through the usual thorough testing-out process, H. M. Vale, the Rambler representative at Beloit, Wis., will drive one of the new cars about a thousand miles through lower Wisconsin.

A RAMBLER IN THE SAN JOSE, CAL., POLICE SERVICE.

Realizing the value of the automobile as an aid to the maintenance of proper police service, the municipality of San Jose, Cal., placed an order for a Rambler Model 21 with F. H. Bush, the local agent. The accompanying photograph shows Chief of Police Carroll at the wheel.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Camden Auto Exchange, of Camden, N. J., has been incorporated with a capital stock of \$25,000, and George W. Smart will be the local manager. The concern will deal in automobiles and supplies.

According to mail advices from France received by the American Locomotive Automobile Company's branch in New York, the Berliet is achieving victories of no less value in Europe than in this country. At the Saltburn races in England a 22-horsepower Berliet won the Rowland Cup and a gold medal by defeating a field of twelve of its own power, and in a strenuous endurance test an 80-horsepower Berliet was victorious, both achievements having been attained in competition with the best makes of foreign cars.

A special round tread racing tire is the latest product of the Michelin et Cie, the French tire makers, and it is coming in for an unusual amount of favorable comment at the hands of its users. It is made with more fabric and with a heavier tread than usual, and though especially designed for racing purposes has also been found equally well adapted for touring, particularly on heavy cars. E. Lamberjack & Co., the local Michelin agents, have had an unusual demand for the new tire during the three months that they have handled it.

It was erroneously reported that Lytle's accident at Detroit on July 4, when his Pope-Toledo went through the track fence, badly smashing the car and spoiling his chances of winning, was due to a bursted tire, as the Hartford Rubber Works Company, Hartford, Conn., took pains to ascertain the true cause of the accident, and found that it was due to the breaking of the staybolt on the detachable rim that was employed, the tire, which was one of the Hartford-Midgley treads, being found in perfect condition after the accident.

H. J. Edwards, chief engineer of the Stoddard-Dayton Company, Dayton, O., who has been largely responsible for the great success of the cars of this make, was given a surprise by C. G. Stoddard, vice-president and general manager of the company, last week. In celebration of the completion of the Type 8F touring car—the latest addition—a dinner was prepared in Mr. Edwards' honor without his knowledge, and he was presented with a huge silver loving cup, which, according to report, was filled with Stoddard-Dayton "enthusiasm."

After several months' work by one of the foremost experts in the country, and at an expense of several thousand dollars, the Hartford Rubber Works Company have just gotten out a most comprehensive road map. It covers all of the territory east of Cleveland and Pittsburgh, north as far as Toronto, showing the best roads in this entire territory to and from the Jamestown Exposition. The map has been made thoroughly up-to-date, for which the latest and most complete touring information has been utilized. Copies will be sent gratis on application to the Hartford factory.

Two additional buildings are shortly to be erected by the Crawford Auto-

motive Company to increase the facilities of its plant at Hagerstown, Md., in order to take care of the large demand for 1908 cars of this make. R. B. Crawford, president of the company, and a member of the Standardization and Technical Committee of the American Motor Car Manufacturers' Association, states that the working force will be increased 40 per cent, and the Crawford output doubled next year. One of the new buildings will house the body building department, and the other the tool room and additional machinery.

The Monarch Motor Car Company broke ground for its new factory at Chicago Heights, just outside the Windy City, on Monday last. The main building, which will be used principally as a machine shop, will be of fireproof construction and have a floor area of 21,000 square feet. It will have a saw-tooth roof and will have metal window frames throughout. Pending the completion of the new building, which has been made necessary through the destruction by fire of the former plant, the company is located in Chicago Heights, about half a mile from the new works.

D'Arcy Scott & Co., San Francisco agents of the Dragon Automobile Company, Philadelphia, have wired that a Dragon car is now on the way to New York in an attempt to break the coast to coast record, now held by the Franklin car, which made the trip in eighteen days. The Dragon, which is on its way, is the same one that broke the 100-mile round-the-bay record in 3.26, or 23 minutes better than the previous performance. Since that time it has been run 2,500 miles. The same crew that handled the car in its former run are now making this latest attempt on the transcontinental figures.

Allegheny County is one of the hilliest in the East and likewise its roads are of the worst, but it is about to set out to make them the best, and, as a preliminary, the commissioners of the county advertised for an automobile. In order to make certain that no mistake should be made in the choice, extended demonstrations were had over some of the worst roads, and the process of elimination ended the other day by the selection of a Winton, the choice probably being influenced by James F. Burke, one of Pittsburgh's pioneer autoists, who represents Allegheny County in Congress, and who swears by the Winton.

J. D. Maxwell, of the Maxwell-Briscoe Motor Company, in an interview, thinks that the standard touring car of the future will be a medium-powered touring car of from 22 to 26 horsepower, and that, although there will always be a demand for very high-powered and fast cars, the average man will think a 24-horsepower sufficient for his requirements. "In fact," says Mr. Maxwell, "horsepower in itself is not so much of a factor as having a car that is efficient in every sense of the word. The power losses between the engine and transmission should be reduced to a minimum, and the weight kept down as low as is consistent with strength."

A business man, residing in Hartford, Conn., and doing business in New Haven, makes from one to three round trips a

day in his 45-horsepower Columbia, and states that he not only makes the trip faster than by train, but he enjoys it as well. Another Columbia owner, a market gardener, used his car to transport his produce by removing the tonneau and substituting a large box, and still another Columbia owner uses his car for transporting merchandise for the firm with which he is associated, and does it far cheaper than it could be done by horses. The above only serves to illustrate that the automobile is the most resourceful vehicle extant.

O. W. Powers, who is one of Utah's leading democratic citizens, came to Peoria, Ill., recently, accompanied by Mrs. Powers and Powers, Jr., to take delivery of a 1907 40-horsepower Glide, in which they left last Tuesday on a 7,000 to 8,000-mile tour of the United States. The Bartholomew Company supplied one of their experts to take charge of the car. From Peoria their route lies across Illinois to Toledo, thence to Cleveland, Buffalo, New York, Alexandria Bay and the Thousand Islands, where some time will be spent. Returning, the route will be via Albany, New York, Philadelphia, Pittsburgh, Cleveland, Chicago, Peoria, Des Moines, Omaha, Denver and Salt Lake City.

Cloud Cap Inn is perched at an elevation of 7,500 feet up on the side of Mount Hood, and, for the first time in the history of automobiling in Oregon, an automobile has succeeded in making the climb. The feat is all the more marvelous as it was accomplished by a single-cylinder machine—the 10-horsepower Cadillac. Several attempts have been made previously without success, and the recent test was made with a view to determining whether it would be practical to install an automobile stage service to the inn from the Hood river. The car was driven up by Howard M. Covey, of Portland, and he thinks that after the road has been put in good condition the run will be an attractive one for tourists from Portland.

Bulletins just issued by the Dayton Electric Manufacturing Company, descriptive of the Apple dynamo storage battery system of "Floating the Battery on the Line," are entitled 1C, 2A, and 5A, and contain a full description of the accessories made by this concern, which has long made a specialty of direct current ignition apparatus. Bulletin 5A is devoted entirely to a description of various attachments for using electric lights in oil lamps, gas lamps, etc., as well as illustrating a full line of lighting fixtures. Copies will be sent gratis on application.

As a result of the confusion that has arisen over the so-called twenty-four-hour records, in some of which several cars have been used, while the entire distance has been made by a single car in others, such as the performances of the Autocar and the Lozier at the Point Breeze track, Philadelphia, the makers of the latter car are endeavoring to have the rules for the Brighton Beach twenty-four-hour race framed so as to cover this point definitely. Those which are to come off on August 9 and 10 are supported by the manufacturers who are attempting to demonstrate the staying

qualities of their cars and the awarding of a prize to a car that may have been on the track but a few hours of the twenty-four is a result of a very unsatisfactory nature in the opinion of the Lozier people.

The Adams & Elting Company, Chicago, Ill., have just completed the purchase of the entire paint, kalsomine and paint specialty business of the Rubber Paint Company, of the same city. This purchase also includes the taking over of the Eureka Elastic Paint Company, a subsidiary concern of the Rubber Paint Company. The latter company was established in 1868, and has made a national reputation, some of its best known lines being rubber paint, Naples velvet finish and Mirror Back paints, all of which will continue to be manufactured under the same formulæ and sold under the same brands as formerly. The officers of the enlarged company are William Porter Adams, president; Joseph Gale, vice-president; Phillip L.F. Elting, general manager and treasurer, and Howard Elting, secretary, no change having been made on account of the consolidation.

**NEW AGENCIES ESTABLISHED.**

According to a recently published list of automobile dealers in the United States, the H. H. Franklin Manufacturing Company, Syracuse, N. Y., are represented by no less than 106 firms throughout the country. There are 12 in New England, 35 in the Middle Atlantic States, 15 in the Southern, Gulf and Central States, 21 in the Northern Central States and 23 in the Western States, making a total of 106. Work is progressing rapidly on the new concrete addition to the plant and more attention is being paid to the production of commercial vehicles for the season of 1908.

Further evidence of the aggressive campaign being waged by the Corbin Motor Vehicle Corporation, New Britain, Conn., is shown by the number of recent additions to their agency forces, the following well-known dealers being the latest to take on the representation of the "full-jeweled" Corbin: Dupont Garage Company, Washington, D. C.; H. O. Harrison Company, Los Angeles, Cal.; J. Archie Hess, Seattle, Wash.; Ford Latham, Schenectady, N. Y.; Frank P. Moshier, Jr., Greenwich, Conn.; Park Garage Company, Allegheny, Pa.; David L. Parker & Co., New Bedford, Mass., and the Sawyer Carriage Company, Lowell, Mass.

**PERSONAL TRADE MENTION.**

S. A. Campbell has just resigned as manager of the accessory department of the E. T. Kimball Company, Boston, and will announce his new connection in the near future.

E. Favary, who has been identified with the automobile industry in this country and abroad for the past twelve years, has just severed his connection with the Automobile Auction Company of America and will for some time devote his attention to perfecting several devices connected with the automobile on which he holds patents.

G. L. Lloyd, for the past fifteen years connected with the Avery Stamping Company, Cleveland, O., has just joined the forces of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., and will form a member of the selling staff.

The travelers of the company are now on vacation, immediately at the end of which they will assemble at the factory for annual instruction and preparation for the 1908 selling season.

J. Arthur Hittle, late superintendent of the Marion Motor Works, Indianapolis, Ind., and Charles S. Crawford, of the Lozier Motor Works, Plattsburg, N. Y., have just joined the forces of the Speed Changing Pulley Company, Indianapolis, Ind. Mr. Hittle assumes the position of general superintendent of the rapidly growing engine department of the firm, while Mr. Crawford succeeds F. D. Carrico as mechanical engineer.

**THE BOOK OF PACKARD THIRTY.**

What is without doubt the most artistic example of the printer's and engraver's arts that has ever taken the form of an automobile catalogue is represented by "The Book About Packard Thirty," just issued by the Packard Motor Car Company, Detroit, Mich. It is apparent at a glance that its *raison d'être* is not so much to sell Packard cars as it is to show why they sell themselves. This gem is enclosed in a fitting receptacle of natural veneer bearing the "P 30" escutcheon as well as the name of the recipient in gilt, and the unfolding of a second cover emblazoned with the familiar outline of the car's radiator front and the name Packard across it, is necessary before the jewel itself is revealed.

The cover gives a veined parchment effect, while the body of the work is printed on an appropriate dull cream paper. The frontispiece, consisting of a reproduction of an oil painting by Henry Thiede, entitled "On a Long Road with Many Charming Miles," and depicting a Packard Thirty runabout in a very attractive setting, gives an inkling of the style of what is to come. The brief foreword telling the life history of Packard Thirty and its predecessors, is followed by two heavily illuminated pages in medieval style, setting forth the Packard Ideal. This is followed by several pages appropriately illustrated and describing the various types of bodies supplied. The subject then changes to "The Factory Progressive," a number of pages being devoted to the painstaking methods employed in the Packard plant, while this in turn is followed by a brief two pages entitled "Fifty Thousand Miles," telling of the Packard testing campaign. Several pages descriptive of the mechanism of the Packard Thirty, appropriately illustrated, conclude the work, which is from the pen of E. Ralph Estep. The illustrations and ornamentation being by Henry Thiede and a number of others.

**INFORMATION FOR AUTO USERS.**

**The Hall Carbureter.**—The accompanying sectional illustration depicts the construction of the Hall carbureter, manufactured by the Charles E. Hall Company, Buffalo, N. Y., who are successors to the Union Manufacturing & Specialty Company. In placing this carbureter on the market no attempt has been made to evolve a device on revolutionary lines of design, but rather to produce a carbureter that should be the result of close study of the problem, supplemented by experience in the requirements of this most essential function of the automobile motor. The supply of gasoline enters at the point I, filling the float chamber D, the float P being made adjustable on its stem. The necessary

amount of air for normal operation enters at the intake B, which is constantly open, except for the "strangling" valve Q, which regulates the amount of air that enters the mixing chamber. At slow speed the automatic air valve L remains closed, thus

SECTIONAL VIEW OF HALL CARBURETER.

closing the air port, except that portion controlled by the strangling valve just referred to, which causes a partial vacuum in the mixing chamber. As the motor speed increases this vacuum becomes correspondingly greater, causing the automatic air valve L to open, supplying the extra air needed and thus maintaining the character of the mixture constant.

**Acetylene Gas Tanks.**—Under the title of the Boston Autolight Company, a company has begun the business of manufacturing the "Boston" gas tanks, headquarters being established in the Motor Mart, 224 Pleasant street, Boston, Mass. George S. Atwater, the manager of the company, has been identified with the manufacture of acetylene lamps and generators for bicycle and automobile use for the past ten years, while his associates in the company are men experienced

BOSTON AUTOLIGHT ACETYLENE TANK.

in this line of work. The Boston gas tank is manufactured along standard lines of acetylene gas tank construction and contains a high grade of asbestos packing saturated with chemically pure acetone in such proportion as to give the tank a capacity of 60 cubic feet, the tank dimensions being 6 by 24 inches.

"Waterweb" is the name of a thin, chemically-prepared rainproof fabric which is being manufactured by the Robert G. Wallace Company, 496 Washington Street, Boston, Mass. It is intended chiefly as a hat protector over which it is worn like a veil, though not intended to shield the face. It is made in the shape of a hat and is large enough to protect any headgear from the rain or dust, at the same time being so light and thin that it can be rolled up and tucked away in milady's waist or shopping bag when not in use.

## What the A. A. A. Tour Gave in Results

Besides Telling Forcibly  
of an Industry's Great  
and Permanent Progress

TOURS END, CENTRAL PARK, NEW YORK CITY.—TROPHY DONOR GLIDDEN, CHAIRMAN HOWER, AND A. A. A. SECRETARY ELLIOTT.

ONE judges more clearly something which is not so close at hand. A week ago, when the annual tour of the A. A. A. ended in New York City, with participants sun-blistered and weary, and cars dust-browned and shaking from restricted attention and the effects of the most strenuous endurance tour since the beginning of the industry, it was hardly possible for those who had figured actively in the affair to stand aside and properly appreciate the convincing proof that had accumulated in establishing the worth of the motor-driven vehicle. There always will be flaws in the conduct of any momentous event, and defects unquestionably existed in the running of the joint contest for Glidden and Hower trophies. But after those who had made the long journey had had opportunity of regaining cleanliness, putting on fresh clothes and enjoying a good night's rest, their vision cleared and they truly marveled at what had been accomplished by the sturdy vehicles which survived such a trying examination into their qualifications for appealing to the automobile buying public.

The consensus of opinion among those who circulated in and about the Hotel Astor, where the concluding features of the tour were enacted, was that next year there should be early and complete preparation for a prolonged endurance contest and those engaged should be made fully aware from the outset that the item of pleasure was minor and of the most incidental sort.

A rule calling for the naming of an observer by every entrant is the first demand of those who want a contest and are now thoroughly convinced that a combination of a contest with a pleasure tour won't mix any better than oil and water.

Some insist that everything which is done in the way of work on the car during the entire tour, in addition to keeping

an exact record of the time taken, should be noted in order that the rules shall cover every possible contingency that might arise.

Since the next annual election of A. A. A. officers will take place in December, and those elected will assume office at the beginning of the new year, it should be possible for the incoming administration to get to work immediately on the events of the next twelve-month. It will be remembered that this year the newly elected officers were not in power until the first of March, which meant a delay of a couple of months on the year's work. As a result there was some tall eleventh-hour hustling on A. A. A. tour matters, and while Chairman F. B. Hower worked most industriously, his board could have made good use of the extra weeks which will be available another year. The chairman is now taking his well-earned rest in Colorado.

It was to be expected that there would be some criticism of the management of the tour. Every tour that has been held has received considerable attention from the critics, some of whom deal very fairly, while others seem inclined to search with a microscope for mistakes hardly worth mentioning. To those who had been through the mill of experience, it could not be other than amusing to listen to the complaints and criticisms of those who were having their initiation. Varied in nature and innumerable in number were the tales of woe that emanated from the tyros of the tour, though it must be admitted that there were things which could have been better, and which undoubtedly will be improved upon the next time.

It is the misfortune of every amateur organization that it seldom retains its best workers for more than a year so that they can profit by their mistakes. Perhaps not a few are disinclined to accept a retention of office when they discover that

THE DUST-BROWN CARAVAN TURNING OFF BROADWAY AT WEST 58TH STREET, IN THE HEART OF THE AUTOMOBILE DISTRICT.

the sum total of their efforts oftentimes receives less publicity than the few errors which are certain to be committed by the most painstaking official in his conscientious direction of an affair, the foundation of which has to be invariably built up from nothing.

One of the lessons of the tour was not wasted upon the thousands of farmers who observed with a mixture of opinions the more or less flying progress of the new users of the highway. One tourist who took opportunity whenever occasion offered to chat with the agriculturists met with on the route found an Indiana farmer who expressed the belief that the time was not far distant when the old National Highway would be equally divided between motor-driven and horse-driven vehicles.

"Then you automobilists," said he, "can drive as fast as you want to and get the full worth out of your car with all safety."

"No," he continued, "I do not believe the farmer will be able to buy automobiles for some time in any great quantities; surely not until the price gets more within his means. We have got to keep horses for plowing and other farm work, and when you add an article, the greatest purpose of which is to carry you to town, it is something of too much luxury."

When told that a well-known automobile manufacturer had in mind the early making of a car of the tractor sort, which the farmer can attach to his plow or reaper and utilize in other similar ways, his interest was immediately aroused, and he announced that he would be ready and waiting when it appeared.

Of paramount importance to the automobile industry is the building of roads, and this subject, according to the observation of those on the tour, is destined in the early future to occupy an extraordinary amount of the public's attention.

Of the seventy-nine automobiles which left Cleveland in connection with the A. A. A. tour in any capacity whatever, 64.5 per cent. arrived at destination with the main group. In noting the relatively high percentage of apparent failures, nearly 36 per cent., it should be stated that two or three, having set out with the intention of obtaining a clean score, dropped out of the run as soon as their record was marred, when they were certainly in a position to continue to the end. Three withdrew as the result of road accidents in no way imputable to the car; one abandoned on account of business, and one absentee was caused by the illness of the driver, with no substitute possible.

#### Some Interesting Statistics of the Tour.

Dealing only with those cars competing for trophies or certificates, nineteen of the forty-eight touring machines, or 39.5 per cent., finished the run with an absolutely clean score. In view of the strenuousness of the ordeal, the proportion is thoroughly satisfactory. Sixty-two and five-tenths per cent. of the competing touring cars finished the run as contestants, leaving 37.5 per cent. which were obliged to abandon owing to mechanical defects, road accidents, or continue as non-contestants from a disinclination to face the trying test any further. The mere fact of being penalized does not of necessity imply mechanical inferiority, and in addition to the nineteen cars with perfect scores five others having each less than 100 points penalization, giving a total of exactly 50 per cent., finishing the tour in an honorable position.

Among the runabouts contesting for the Hower trophy three out of twelve starters, or 25 per cent., officially finished the run. In view of the fact that many of these machines were duplicates in chassis

RECOLLECTION OF PENNSYLVANIA'S OIL COUNTRY.

construction of those carrying touring bodies, the mortality by the way is remarkable, and can only be regarded as one of the little inconsistencies of a practical test. Logically the runabouts, with their lighter load, should have found the tour an easier affair than did the touring cars with four passengers and full load of baggage.

**Engine Weakness Was Trifling.**

It will be a matter of satisfaction to the general automobilist, the man who uses a car for pleasure or utility, that but three machines, or less than 4 per cent., had to abandon the run as the direct result of engine weaknesses. This proves most conclusively that the present-day automobile motor has reached an exceedingly high stage of efficiency, for the test to which the engines were put on the heavy ground and in mountain districts was of more than ordinary severity.

When attention is turned to transmission and drive, a less satisfactory state of affairs is found, for 58.6 per cent. of the cars, touring and runabout, which failed to finish officially, were eliminated by defective transmission, springs or axles. If deduction is made of withdrawals as the result of road accidents, it will be found that in nearly every case failure to finish was due to these causes.

**Four-cylinder Engines Predominated.**

Examining the thirty-nine machines of all classes which made the best records in the tour, 82 per cent. had four-cylinder vertical engines, 10 per cent. were two-cylinder opposed type and 8 per cent. were six-cylinder engines cast in pairs. The use of magnetos, of both high and low tension type, shows an ever-increasing tendency, for of the thirty-nine machines under examination 74.3 per cent. were thus equipped. This proportion is certainly not general among American automobiles, for the A. A. A. tour was

TOLL GATE KEEPERS MOVED LIVELY TO GET THE MONEY.

favorable to the high-power automobiles, and our calculations are based only on those cars having made a satisfactory showing. It is suggestive, however, as showing the opinion in matters of ignition of the leading constructors of high-grade machines. On 68 per cent. of these cars, a high-tension magneto was used; 32 per cent. only had the low-tension system with make and break. If only one car from each maker were taken in arriving at these figures, the two systems would be found to be pretty evenly divided, for one firm figures with seven machines and another with four fitted with high-tension magneto, while the opposite school has in nearly every case but one competing machine per constructor.

**Sliding Gear Predominated.**

Sliding gear transmission prevailed throughout, with the exception of a couple of small 16-horsepower machines. Crediting each maker with one machine, the proportion of those having selective type of transmission was 57.8, compared with 42.2 per cent. adhering to the progressive type. Final drive by propeller shaft prevailed in the proportion of 75 per cent., crediting each successful maker with but one machine; 20 per cent. had double side chains and 5 per cent. only used the single chain drive.

Leather-faced cone clutches were employed by 47.4 per cent. of the most successful makers. Grouping all multiple disc and kindred types of metallic clutches, they are responsible for the proportion of 52.6 per cent., which would show that, although the classical cone is no longer dominant, it is still popular.

**Those That Just Fell Short.**

In emphasizing the importance of the clean-score automobiles it should not be overlooked that a certain number of cars, while failing to obtain a position on the honor roll, have a perform-

BUFFALO'S TEAM, WHICH WON THE GLIDDEN TROPHY, NO. 17 PIERCE, NO. 44 PACKARD, NO. 9 THOMAS, NO. 11 THOMAS, NO. 27 PIERCE.

WHEN THE GOING WAS VERY ROUGH.

WHEN TRAVELING WAS SMOOTH.

THIS HOMESTEAD WAS WELL PATRONIZED.

ance to their credit which entitles them to some special mention. The Gaeth and the Oldsmobile, for instance, which each lost three points owing to road obstructions on the most difficult stage of the journey, are worthy of equal credit with the clean scorers.

Maxwell No. 58 suffered a loss of but 12 points, and Pierce No. 21 and Packard No. 44, which lost respectively 90 and 91 points, would certainly have finished perfect but for road accidents in which the machine was not at fault.

In the runabout class there was one contestant, A. E. Hughes, driving Pierce No. 100, who, through frequent punctures, just fell short of a perfect performance.

### VICTOR OF FORMER YEARS NOT IN EVIDENCE.

LOS ANGELES, CAL., July 26.—Percy Pierce's familiar figure was missing from the tour of the American Automobile Association which ended last week, and many of the contestants wondered at his absence. It was explained by the fact that he is at present in this city and has been on the Pacific Coast for some time past in the interest of the bicycle department of the George N. Pierce Company, Buffalo, N. Y., of which he is the head. He has been making his headquarters with John T. Bill & Company, Tenth and Main streets, while in Los Angeles, and has expressed great admiration for Southern California.

### A. A. A. OFFICERS SATISFIED WITH OUTLOOK.

The affairs of the A. A. A. are progressing most favorably, according to the reports presented at the July meeting of the Executive Committee, held Tuesday last at the headquarters of the Association, No. 437 Fifth avenue, New York City.

Chairman Charles T. Terry, of the Legislative Board, made an exhaustive report regarding the national registration measure which the Association has introduced in Congress and which will be vigorously pushed at next winter's session. The passage of this measure will greatly facilitate interstate automobiling, and

at the same time make identification much less difficult and thereby appeal to the general public as excellent legislation.

Chairman Robert P. Hooper, of the Good Roads Board, reported concerning recent sessions of the committee composed of representatives of all the various organizations throughout the country interested in road building. Mr. Hooper was instructed to have his Board co-operate with the other organization.

Acting Chairman A. R. Pardington, of the Racing Board, regretfully reported inability to secure a properly guarded course for the Vanderbilt Cup race, stating that a conference between Chairman Jefferson deMont Thompson and Cup Donor William K. Vanderbilt, Jr., in France had resulted in the decision to postpone the race for this year. A vote of thanks was tendered Mr. Pardington for his conscientious endeavors to bring about the holding of the race.

The report of F. B. Hower, chairman of the Touring Board, will not be presented until September, at which time the entire Board of Directors will meet. It was stated that the tour would result in a surplus. A year ago there was a substantial deficit at the conclusion of the tour.

Secretary F. H. Elliott reported that the membership was steadily increasing, and the figures of the treasurer, G. E. Farrington, showed the treasury to be in such condition as to insure the carrying on of the general work of the organization for the ensuing year.

President William H. Hotchkiss presided at the session, the others present including First Vice-President L. R. Speare, G. E. Farrington, A. G. Batchelder, Chairmen C. T. Terry and R. P. Hooper, and Secretary Elliott.

Prince Henry of Prussia has presented a new trophy in place of the Herkomer (which will henceforth be run off in England), and has informed the Imperial Automobile Club of the terms of the gift. The contest will be run for three consecutive years, with Berlin as the starting point and the finish at Frankfort-on-the-Main.

# WHITE BEATS STODDARD-DAYTON IN RUNABOUT TIE

**T**O settle the tie between the White steamer and the Stoddard-Dayton runabouts, which finished the A. A. A. tour with perfect scores for the Hower trophy, the two cars were sent away from the Automobile Club of America's garage on Monday morning of this week for a run of unknown length. On the completion of the A. A. A. tour the two perfect-score runabouts were locked up to prevent the possibility of replacements or adjustments, pending the decision of the tour's executive committee.

That body decided on an additional run, first to Cleveland, with stages at Albany, Syracuse and Buffalo, then forward over the Glidden tour route until one of the cars was penalized.

E. L. Leinbach again took the wheel of the gasoline car and H. K. Sheridan, of the Cleveland Automobile Club, continued to pilot the White steamer.

Secretary Dai H. Lewis, of the A. A. A. Touring Board, has charge of the tour, preceding the contestants by three hours on a Stoddard-Dayton confetti car, driven by W. W. Macdonald, and each of the contesting cars carries

STODDARD-DAYTON TIE PERFORMER.

an observer. Walter White is accompanying the contestants.

ALBANY, N. Y., July 29.—The result of the first day's run of the two clean-score runabouts was that both machines reached Albany with their perfect record unbroken. The run of 150 miles was planned on a schedule of 17.2 miles an hour, and was

covered by the contestants in 8 1-2 hours, roads being in excellent condition. From here the Stoddard-Dayton and White will run to Syracuse on a schedule calling for twenty miles an hour in the open country and ten miles an hour in towns.

SYRACUSE, N. Y., July 31.—No change has yet occurred in the tie for the Hower trophy, the Stoddard-Dayton and the White steamer having reached here with their clean records unbroken, and will start forward this morning with Buffalo as their evening destination. Although detours were made necessary as the result of road repairs, increasing the distance to 155 miles, H. K. Sheridan's 30-horsepower White and G. S. Smith's 35-horsepower Stoddard-Dayton accomplished the journey within the schedule time of 7 hours 45 minutes, and experienced no trouble en route. Drivers report road conditions as fair. On the weighing in of the observers—appointed by the rival party—it was found that the official on the Stoddard-Dayton car tipped the scale at 268 pounds.

Dai H. Lewis, of Buffalo, precedes the contestants in a confetti car and has charge of the supplementary test.

BUFFALO, July 31.—The White Steamer is the winner. It reached here with a clean score, meeting the 163-mile schedule of 8 h. 30 m. At 5 P. M. the Stoddard-Dayton was still missing, being then a half hour late.

WHITE STEAMER TOP NOTCHER.

## WHAT ONE AIR-COOLED MAKER THINKS OF THE A. A. A. TOUR

Editor THE AUTOMOBILE:

Considerable comment has been appearing in the automobile press of late regarding the absence of air-cooled cars in the 1907 Glidden Tour. One well-known manufacturer went so far as to say, in the columns of "The Automobile," that this absence might be taken as proof of the superior worth of the water-cooled theory. He might have gone even further and stated that the scarcity of entrants this year was due to the fears of a large number of manufacturers that did not participate. Such a statement would have been equally correct—and equally incorrect.

Speaking for the Marmon, we feel that our perfect score in the 1906 tour will have to be sufficient for the time being. Those who were on the 1906 tour know that the air-cooled motors stood the hard work with less annoyance from heating than the water-coolers, and the flies of the automobile press of a year ago will corroborate it. This was all we sought to prove, and the rules,

either this year or last year, would permit us to prove nothing more. In common with many other manufacturers, we have reached the opinion that there is scant glory to be had in an event where there are so many winners—13 out of 67 last year, and 19 out of 47 this year. Had it not been for the heavy rains this year the perfect list would have been even larger. It required only one reading of this year's rules to foresee the result. With the 1908 season about

to open and the shows coming early, we did not consider it worth while to deprive our manufacturing and sales departments of important men for the tour.

We hope the A. A. A. Tour will be different next year. We know of many manufacturers who would be glad to participate in a real test, with severe conditions, official observers and a touring committee that would enforce rigid rules without fear or favor. Until such a test is arranged we shall probably stay in the shade with the wise ones and keep cool.

### SPEED FINAL TEST IN FRENCH TOUR.

PARIS, July 23.—The only touring event directly organized by the Automobile Club of France this year will commence on August 2 and finish five days later. During four days 994 miles must be covered, partially over mountain roads, under ordinary touring conditions, at an average speed of 24.8 miles an hour, with four passengers on board, the full weight of the car, including passengers, not to be less than 3,630 pounds. A rigorous system of parking will be observed at each control, running time to include all attention to motor, tires, filling of tanks, etc. For the four-day touring event the cars are only required to conform to certain overall measurements, height of seats and length from dashboard to rear wheel. When this test has been successfully undergone, a final race will be held in which the fuel allowance will be 4.1 gallons per 62.1 miles.

In the equipment of the cars it is stipulated that the gasoline tanks, which must be of an approved type, and capable of containing 17.6 gallons of fuel, shall be placed either directly behind the front or behind the rear seats. Being fully in view, any attempt at fraud will at once be apparent. Beyond the fact that passengers may be changed at controls if desired, and that dismountable rims may be used and fresh supplies of rims and tires taken up anywhere en route, the touring event will not differ from the usual run of such affairs.

At the end of the fourth day's run one hour will be allowed for changing tires and putting the machines in condition for the fast run. No essential parts, however, must be changed, and it is absolutely forbidden to make any alteration in the gearing of the machines, the intention being to run the race with the cars in exactly the same condition as for the touring test. Before the start of the tour from Paris the gasoline tank, piping, carbureter and all organs by which fuel might be introduced, will be sealed in the manner adopted for Grand Prix racers, the tank

NEW BLERIOT AEROPLANE WITH ANTOINETTE MOTOR.

cap alone being left open until the last day. After the regulation supply of gasoline has been given, this will also be sealed down. At any time during the test the gearing of the car may be verified by the committee and the minimum weight must be maintained during both touring and race days.

The Lisieux circuit, which has been chosen for the final race, is one of the fastest to be found in Normandy; the naturally good roads have been specially prepared for the speed test and will be guarded on the day of the race by 2,500 troops. Though a double-barreled event, the result of the race will alone determine the winner, only those machines being allowed to start in the final which have accomplished the four previous stages on schedule time and without replacements.

Forty-four cars have entered for the Criterium and the Press Cup, the large majority of them French. They are: Gladiator 2, Peugeot 3, Mercedes 1, De Dion-Bouton 3, Vinot & Deguingand, German Chainless 2, Dietrich, Gobrin-Brillie, Aries 2, Cottin & Desgouttes 3, Cornilleau & Sainte-Beuve 3, Argyll Motors, Limited, Mors 3, Martini 2, Gillet-Forest, Motobloc, Martin & Lethimonnier 2, Regina Dixi 3, M. R. G., Eugene Brillié, Rebour, C. G. V., and Westinghouse.

### BLERIOT PRODUCES NEW AEROPLANE.

PARIS, July 22.—After experimenting on an aeroplane having the form of a wild duck, M. Bleriot, the French aeronaut, has produced a new and original model of flying machine of the Langley type. Chassis construction consists of a square section frame narrowing towards the rear, mounted on three bicycle wheels, with coil springs between the front axle and the frame. At the forward and rear end of the chassis are a pair of wings, the outer edge of each forward wing having a pivoting rudder. A 24-horsepower Antoinette motor installed at the fore end of the frame operates a two-bladed propeller. The driver's position is in the center of the frame, his head only being visible. The necessary levers for controlling the engine, the rear rudder and the two wing rudders, which may be operated either simultaneously or independently, are conveniently brought to his hand. Initial experiments on the Bagatelle polo ground near Paris, with three different sets of propellers, failed to cause the machine to leave the ground, the defect of the aeroplane being that it is too heavily weighted forward. The frame will be lengthened in order to give greater bearing surface forward, but it is not expected that very good results will be obtained until the new 50-horsepower Antoinette motor is installed.

### FRANCE TO TEST WRIGHT BROS.' AEROPLANE.

PARIS, July 27.—Immediate developments in connection with the Wright brothers' aeroplane mystery are expected as the result of the arrival of Orville Wright, of Dayton, who joined his brother here yesterday. It is declared that the Wright brothers' machine is now in France, and that a flight will be arranged shortly under conditions which will safeguard the inventors' secret.

A NOON-DAY CONTROL ON THE BELGIAN TOURING COMPETITION, WITH CARS PARKED IN FRONT OF MALINES RAILROAD STATION. †

## TOURING AND RACING IN BELGIUM.

OSTEND, BELGIUM, July 22.—Belgium, from north to south and from east to west, is alive with automobiles and buzzing with automobile interest. The Criterium, a five-barreled event comprising a regularity test, a kilometer flying and a mile standing race, a ten-kilometer race and a five-kilometer hill climb, opened the proceedings at Spa. While bustling officials occupied themselves with weighing-in, verification of cylinder areas, and details of organization, energetic gendarmes earned universal disgust by holding up every automobilist passing over rain-sodden and deserted Avenue du Marteau.

Seven classes were provided for the 34 entrants, commencing with 75 millimeters bore and a minimum weight limit of 1,540 pounds, and increasing by stages to 145 millimeters cylinder bore, the increase of weight being 35 pounds for every millimeter above 75. A couple of 15-horsepower four-cylinder Ford runabouts figured in a class by themselves with a total weight, including two passengers, of 1,698 pounds. French and Belgian cars of an equal cylinder bore weighed as high as 3,300 pounds.

During the three-day stop-over at Ostend, racing cars, as well as the tourists engaged in the Criterium, took part in the ten-kilometer speed tests over a five-kilometer track, a standing start being given in each direction and the times added. Rigal, driving one of the Grand Prix Darracq machines, made the fastest burst of speed in 5:6 3-5; Baron de Caters (Mercedes) came second in 5:34 3-5; Hyeronimus, also on Mercedes, was third in 5:35 4-5; Christiaens, driving a Sporting Commission Darracq, came fifth, and De Langhe, on the Darracq racer with which he won the Sporting Commission Cup, finished last. Giuppone, on a Peugeot motorcycle, was the fastest of his class, in 6:34, against a small field of competitors.

Despite the hot weather, which was the cause of considerable tire trouble, the touring event was more of a pleasure jaunt than a tour, practically all the competitors accomplishing the stages at 18.6 miles an hour according to schedule; interest, therefore, centered entirely around the speed tests. The Franchomme Cup, for the best performance on a seven-kilometer hilly road, was awarded to Wery, driving a Belgian Nagant car. Awards were made according to a point system which gave every competitor, of whatever class, an equal chance. In actual speed the Nagant was also the winner, his average being 62.9 miles an hour.

For the Prince de Caraman-Chimay Cup, which comprised a three-kilometer straightaway, a mile on a slight grade and 300 meters on a 14 per cent. grade, the same system of classification by points for all classes was adopted, Servais, on a chainless Germain, proving the winner, with Cissac, on a single-cylinder Alcyon, a good second.

### Three Distinct Races for Classic Ardennes Course.

Owing to the multiplicity of regulations, three distinct races have been arranged over the Ardennes circuit on July 25, 26 and 27. The first day will be for machines competing under the German Emperor's Cup rules, the second day the Liedekerke Cup will be

held on a limited cylinder area, and the third event, open to all, will unite principally Grand Prix racers. The present entry list for the open race is three Lorraine Dietrich, the two British Weigals built for the Grand Prix, a Darracq to be driven by Huntley Walker, and Jenatzy and De Caters each with a Mercedes. The Mercedes to be driven by Baron de Caters is the one with which Hemery secured ninth position in the Grand Prix. It is expected that the full Bayard-Clément team and one Porthos will join before the final closing.

According to an incomplete *Herald* cable report from Bastogne, the Ardennes race under the German Emperor rules was won by Moore Brabazon, 17 seconds ahead of Koolhoven, with Guinest 1:8 behind second man. The distance, 372.6 miles, was covered by the winner in 6:14:15. There were twenty-three entries.

## CHRISTIE'S FAILURE DUE TO UNPREPAREDNESS.

Chairman Jefferson De Mont Thompson, writing from Paris, where he has been staying in expectation of being able to make arrangements for the Vanderbilt Cup race, states that Walter Christie's failure to make a showing in the Grand Prix was due to his late arrival on the course and small opportunity for practice. French experts agreed that the "Blue Streak" was fast, well designed and carefully built, but was unable to show its qualities through unpreparedness. American racing constructors, according to foreign belief—which pretty near approaches a certainty—are slow to learn that early preparation is half the battle. Christie was keenly disappointed, but will try again.

Mr. Thompson, as A. A. representative, did all that was possible to assist the American driver before the race, and was present at the starting line to give Christie and Strang a send-off. Mr. Thompson is now touring in Germany, and will not return until August.

CHAIRMAN THOMPSON WISHING CHRISTIE GOOD LUCK.

## PEKIN-PARIS ELIMINATES ONE.

Nobody will deny that there was a more than ordinary amount of pluck in the attempt of the three French, the Dutch and the Italian chauffeurs to run their automobiles entirely by their own power from Pekin to Paris. Judging from the reports which are to hand from the small procession, four of the cars will accomplish the colossal feat and will in a few weeks' time be in the French capital again.

Cormier and Collignon, two veteran European tourists, took charge of a couple of 8-horsepower De Dions, Godard mounted a 16-horsepower Spyker of Dutch origin. Prince Borghese equipped an Itala of 40-horsepower for the fray, and Paul Pons looked to a Contal tricar of Parisian origin for his means of locomotion over a continent that had never seen an automobile.

Starting from the French legation at Pekin, the five kept together for about a third of the journey, when the Contal tricar had reluctantly to abandon the tour, the heavy equipment necessary for camping out, fording streams, bridging ravines, etc., being too heavy a load for a three-wheeler. Although provision had

LEAVING PEKIN FOR PARIS, DE DIONS IN FOREGROUND.

been made for a supply of gasoline to be placed along the line of march, the stages were widely spaced and it was necessary for the cars to be able to carry an exceptionally large quantity along with them. The illustration of the Itala will show how special storage room was obtained, this Italian machine having a large tank securely fastened behind the two seats. The Itala, as well as the Contal, had portable bridges, those of the Italian car doing duty as mud guards on ordinary running. Contal's bridges, which were carried on stays at each side of the driver, had a triple use—they acted as mud guards, they formed tent supports and they could be braced up for getting across a stream or a ravine.

Undoubtedly the most hazardous portion of the journey was the 700-mile trip across the sandy wastes of the Gobi desert. One hundred miles from Udde and four hundred miles from Ourga, the Spyker found itself stranded without a drop of gasoline in the tank, the Itala miles ahead and the two De Dions wandering no one knew where. Fortunately, the French machines caught sight of the fuelless Dutchman, calculated the amount of gasoline they would need to the next supply station, gave the rest to their companion and, when they reached the welcome tanks, shipped a supply back to the wanderer by a camel caravan. Over desolate,

ITALA: SPECIAL TANK, PORTABLE BRIDGES, PIRELLI TIRES.

rocky wastes, with not a soul in sight, up mountain sides, down precipitous slopes, then again up impossible grades, the five plodded on until Ourga was reached, and the director of the Russo-Chinese bank welcomed them to a joyous fete.

From the thousand-roofed golden palace, where the "Little God" of Lhasa had taken refuge since the British occupation, a message came for the Pekin-Paris travelers. The "Little God" had an automobile, a fragile little thing that never had run; would the great travelers come and animate its silent organs? But the "Little God's" automobile was irreparable, and when the party moved forward it was left behind to an eternal silence.

Grades of 15 to 20 per cent., tracks of thickly wooded country, heavy rain which transformed the land into a huge bog, streams which could only be forded by the aid of ox-teams, are the themes of the letters describing the going, until Kiakta, the outpost of European civilization, was reached. From this point the telegraph takes up the story, more graphic in its simplicity than any flowery word-painting. This is what Cormier has to say:

"Prince Borghese is crossing the Baikal by boat. We were more sportive and intend to get around by our own power. Discovered, however, that the rivers flowing into the lake are too numerous, too deep and lacking in bridges for us to do it. Forced at last to come back to Misovaia and take the boat, as the Prince had done.

"[LATER]—Have changed our plans. Boatmen ask an exorbitant price, and we shall cross the Baikal by train.

"Have covered 320 miles in two stages. Reached Nyneulinsk. Country more civilized now, but raining continuously.

"Covered 200 miles in two days. Had rained continuously for eight days. Are worried by squadrons of mosquitos. What next?

"Covered 150 miles last stage. Spyker having magneto troubles; intends to come by train to Tomsk for repairs, go back and start again. *Matin* has cabled that taking train will disqualify.

"Traveled 115 miles to Atchinsk. It has stopped raining. Roads are a bog, but we are still going on.

"Reached Marinsk, covering 125 miles to-day. Nothing but mud; but the roads are better than those of China. We are making progress."

DISSEMBARKING SPYKER CAR AT PEKIN RAILROAD STATION.

# GRAY CAST IRON IN AUTO CONSTRUCTION\*

By THOMAS J. FAY, E.E.

It would be a great boon if this product could be eliminated from automobiles, but it is almost the exclusive material for use in cylinders and pistons, and it is occasionally used for crank-cases in "double-opposed" motors and for "planetary gear" housings.

There are cars employing this material for wheel hubs, compensating gear housings and brakedrums, but such cars have no claim on the affection of users of automobiles and never will have. The dominant idea is to get rid of castings of all kinds, and especially gray cast iron, because it has not the one advantage rightly claimed for aluminum, in other words, cast iron is *not light*, whereas aluminum is.

In a general way, cast iron is stronger than aluminum and under certain conditions will do what aluminum is not suited for, nevertheless, as before stated, cast iron does not hold out as much promise as one could hope for, but for piston packing rings, good gray cast iron seems to have no equal, and for that purpose it is a commendable product.

From time to time attempts have been made to produce cylinders and pistons of steel forgings, but such enterprises were confined to racing car work, and as yet such efforts have not amounted to very much, although the few cylinders the author has been enabled to examine looked all right, even after a goodly amount of service.

The main trouble lies in being unable to so design cylinders as to produce them in forgings, at a cost to be tolerated in cars for commercial purposes. In racing cars, cost is not considered if only the cars can be made to excel. Pistons could be produced in steel forgings very well indeed, but if cylinders are of cast iron, pistons should be of the same material, this being one case in which similar metals work together without showing bearing distress.

At the present time "gun steel" forgings are being experimented upon for cylinders and pistons and, if the shapes can be suitably modified, there are prospects of success, for gun steel is a very good product for just such purposes. Figure 3 illustrates a turning from L. B. R. Krupp gun steel that in itself shows a remarkable product, but, contrary to the general belief, gun steel is not of extraordinary strength, as the test CVII will show.

For the present, at any rate, gray cast iron must be tolerated, and if so, to get all there is in it, a study must be made of its characteristics and its vagaries must be mastered, else "wasters" will be a-plenty and casualties in service will be numerous.

Gray cast iron, in the sense that it is referred to here, is a remelt, in a cupola, of suitable grades of blast furnace pig iron. The gray variety of cast iron is that holding such an excess of graphite as to conceal the iron from view in the fracture. It is a foundry problem to arrive at any desired result by mixing the material for the charge to the cupola in such proportions as to afford cast iron holding requisite qualities for any given purpose, and for cylinders as used in automobile motors. This problem is one out of the ordinary and to it may be said success is rarely assured.

The low limit of total carbon in cast iron can be set down as 2.20 per cent., although, having done so, it means very little to the automobile engineer because the limits for cast iron of the requisite qualities in cylinder work are very well defined. The components in cast iron are iron, silicon, sulphur, phosphorus, manganese, combined carbon, graphitic carbon and more or less "slag." While this latter compound is not desired, it does abound more or less in castings and must therefore be taken into account.

Unlike in steel, the components sulphur and phosphorus are held at a fairly high limit for reasons that will be explained, although, as in steel, these elements have their painful influences on the strength and endurance of the product.

In general, the limits to be put on the elements entering into the castings for cylinder and piston work can be set down once for all, viz.:

Combined Carbon, Maximum.....	0.75%
Silicon .....	1.20%
Sulphur .....	0.085%
Phosphorus .....	0.50%
Manganese .....	0.75%
Slag and Oxides... ..	nil.

It will be understood the components range at variance with these maximum values, and in fact silicon generally exceeds the

limit set as desired, notwithstanding the fact it tends to a lowering of tensility but it also affords fluidity which is a much needed quality in cylinder irons. It will be no surprise then to discover higher silicon than that desired in cast iron for cylinders and, as a matter of fact, it generally ranges between 1.40 and 3.25 per cent., although this latter value augurs an inferior product.

In fairly good castings the silicon content is likely to run about 1.60 per cent., but even this value will show on the tensile strength, although good sound castings must rank first, and it is customary to assume that gray cast iron for cylinders should have a minimum value of the tensile strength of 18,000 pounds per square inch, which value can be expected in good, sound castings even with silicon at 1.60 per cent.

Right here, it may be well to point out that claims of even 35,000 pounds per square inch are frequently made for cylinder castings, and few will admit that the strength should be less than 26,000 pounds per square inch. At all events, it matters not what the strength may be in isolated cases since none will guar-

(c) The governing conditions as drawings, patterns, cores, fixtures, etc.

The desired condition of the castings from the point of view of the chemical composition and the micro-structure can scarcely be elaborated upon in the manner common to the treatment of this subject. Fixing limits of the components is by no means fixing anything, because limits as fixed, rarely, if ever, obtain in the actual castings, although it is well enough to have in mind the fact that excesses of one or the other of the contents will tend in directions that can be set down.

It is the relation of the elements that truly counts for good or for evil, and it is this relation that is shrouded in mystery, although advanced writers have endeavored to lucidate the subject, but have failed alternately to impress an audience which, however, is to the discredit of the audience, rather than due to lack of effort on the part of the doctors.

As a general rule the question of the condition of the elements and their relation is quite beside the discussion, and the whole matter is resolved into a simple statement of the percentages of the elements present and a guess—in the dark—as to what should result under such conditions.

Sanveur, Howe, Harboard, Fol and other metallurgists, have repeatedly pointed out that the carbon condition is paramount and that the total carbon is a secondary matter for discussion, or better yet one of the factors. How fruitless it is then to merely fix upon the total carbon or the combined carbon on the one hand and the graphitic carbon on the other, what the carbon combines with, how it combines and the combinations so formed, would seem to be of extreme importance, but from all accounts these matters are in many instances, at any rate, left out or given but scant attention.

Quite recently Robert Fol, for the *Cycle and Automobile Trade Journal*, December 10, 1906, reported on some thirteen cylinders and gave photo micrographs to sustain his position. While the report is only of passing interest here, the prime fact is worthy of much consideration in that of the whole number of cylinders investigated none was above criticism and all but two of them were quite below any standard of usefulness that should obtain in automobile work. Some of these cylinders were made abroad and they offered no advantage that anyone would care to copy.

If one should take all of the evidence to be had on every hand and judge accordingly, it would be to say that cast iron is by far too irresponsible to use in automobile work at all, but on the other hand cast iron is used, quite to the exclusion of any other product for cylinders and pistons and in most cases the cylinders and pistons so made do serve the purpose.

Gray cast iron, unlike steel, holds graphite as one of the carbon conditions, and it is the presence of this same graphite that makes the difference for the most part between cast iron and steel. The graphite is simply present as an excess over and above the quality of carbon that will combine to form cementite, pearlite-ferrite or such other product as may be developed under the several conditions possible to bring about.

If, in gray cast iron, the total carbon is upwards of four per cent., it is at once plain that graphite will be present in considerable excess, because, in the nature of the product, combined carbon will be far below the point of chemical absorption of all the carbon present.

The graphite present is indirectly an indication of softness in proportion as the graphite shows in excess, but it is something of a fallacy to attribute this softness directly to graphite. Softness and ability are due to a small amount of cementite and relatively a large amount of ferrite rather than to a large excess of graphite.

If, then, the total carbon is a constant, the soft iron will show a large excess of graphite because the total combined carbon will be low, and if this condition obtains, the ratio of ferrite to cementite will be more nearly in accord. True, graphite itself is of low strength, and an excess of graphite enmeshed in the matrix must have its weakening effect, but the difference between cast iron and steel lies in this fact. Steel holds little or no

antee every casting to be up in any such values, and safety demands that the minimum value be taken as the maximum in practice.

To illustrate the extent to which slag and oxides will defeat the aim to procure good sound castings, the author only needs to refer to a single recent experience as follows: It was desired to procure four cylinders for a motor and the first forty-nine cylinders procured—to get four—were so imperfect as not to be used. By changing the mixture, the methods of gating and other changes besides, it was finally possible to procure thoroughly good castings.

In this instance the pattern could not be claimed as at fault in any essential particular, nor was the pattern changed, excepting to eliminate a little extra metal from one or two places and to add a little extra finish to the valve seats. The castings were porous, spongy, and had blow-holes or other defects, but the defects did not persist in showing up in any one zone. When the castings finally came out good enough to use, they looked good and undoubtedly the "mixture" had much to do with the final success, as well as the series of preceding failures.

This instance of persistent failure is but one of many coming to the author's notice from time to time, but this case was a little unusual because the foundry was one fitted up for this class of work and, as a rule, its product is thoroughly good as cylinder castings go. This illustrates one other point, i.e., a new pattern always offers new problems and is likely to engender complications in diverse ways. Nor can the foundry be expected to produce good cylinder castings directly. Some fitting out must be done; hence, to realize the best results, cylinders must be ordered in quantity, this enabling the foundry to break in core-makers and moulders.

To reach a good understanding of the wants of the automobile engineer the matter of gray cast iron for cylinders and pistons must be elaborated on a basis involving three points of view, viz.:

(a) The desired condition of the cast iron, taking into consideration its micro-structure.

(b) The design of the castings, taking into account the desired strength and the needed shape as well as the foundry problem.

graphite, hence the matrix is not laminated with graphite and the strength of the matrix then holds rather than the strength of the laminations of graphite and the matrix as in cast iron.

When liquids solidify, the freezing process involves a "eutectic," an excess or an unsatisfied liquor, and it does not seem to matter what the compound may be, the phenomena are common to all; iron and steel are no exception to the rule and, in the main, it is possible to predict what will be the structure, if only one may know the composition and control the process.

A product holding 0.90 per cent. carbon will resolve itself into pearlite if the "teemed" mass is allowed to freeze unrestrained. This, then, is a gauge point ever to be kept in mind. If, however, the total carbon is less than 0.90 per cent., there will be an excess of ferrite and lowering the carbon increases the ferrite and diminishes the pearlite in direct ratio as follows:

$$90 : Y :: 100 : X.$$

When

90 = the total points of carbon in a pure eutectic of iron and carbon.

Y = the points of carbon in a hypo-eutectic mass, that is to say, a mass holding less than 90 points of carbon.

100 = the percentage of pearlite—a carbon condition—in a mass holding 90 points of carbon.

X = the pearlite present with Y points of carbon.

As for example. Steel, holding 0.45 per cent.—45 points of carbon—would hold pearlite as follows:

$$90 : 45 :: 100 : X = 50 \text{ per cent.}$$

Since only 50 per cent. is pearlite, the balance must be something besides, and in a hypo-eutectic, the balance is ferrite, and that balance must be: 100 = pearlite-ferrite and 100-50 = 50 per cent. ferrite.

If, on the other hand, the eutectic is hyper instead of hypo, that is, if the total carbon exceeds 0.90 per cent., the excess over and above the pearlite present will be cementite under slowly cooling conditions in the freezing process, and then it may be said, all that is not pearlite will be cementite in the hyper-eutectic, just as it may be said, all that is not pearlite is ferrite in the hypo-eutectic.

Cementite responds to the formula Fe<sub>3</sub>C and satisfies the derivation, Cementite =  $\frac{3 \times 56 + 12}{12}$  in a hyper-eutectic,

When

12 = the atomic weight of carbon.

56 = the atomic weight of iron.

Hence,

$$\text{Ferrite} = \frac{3 \times 56}{12} \text{ in a hyper-eutectic.}$$

For each one per cent. of cementite in the matrix can be resolved as follows:

$C = \frac{1 \times 12}{56 \times 3 + 12} = 0.0667$  per cent. carbon per one per cent. of cementite. Whereas of cementite it may be said the carbon therein may be found as follows:

$$\text{Fe}_3\text{C} : C = \frac{12 \times 100}{56 \times (3 + 12)} = 6.67 \text{ per cent.}$$

Pearlite, the name given a certain formation involving carbon products as steel and cast iron, consists of ferrite and cementite in certain proportions. Pearlite is said to be the sole product of steel under normal conditions of freezing, if the carbon content is 0.90 per cent. Carbon is, therefore, present in this pearlite in the cementite and ferrite formation, and according to Howe, the cementite of the pearlite formation holds at about  $0.90 \times 15 = 13.5$  per cent., and if pearlite is a name for the condition obtaining with the micro-structure in mind, the ferrite portion must be  $100 - 13.5 = 86.5$ . (Howe: Iron, Steel and Other Alloys, Second Edition, p. 183.)

In the hypo-eutectoid product, excess ferrite holds in the proportions as before stated, but in the hyper-eutectoid formation it is excess cementite that will be found. Considering the hypo-eutectic a little further, it will be well to point out that whilst the

relation of excess ferrite to pearlite may be resolved by direct proportion, yet even so, the matter is acceptable of lucidation in what might be termed a more satisfactory way as follows:

Total carbon  $\times 15 =$  cementite; with the cementite, ferrite will be associated, cementite  $\times 6.4 =$  ferrite, in the form of pearlite, and the sum of these equals the pearlite, whilst the remainder from 100 per cent. will be excess ferrite.

An example of this will make the matter more clear which, for illustration, 0.45 per cent. total carbon in steel may be taken, hence:

$$45 \times 15 = 6.75 = \text{cementite.}$$

And

$$6.75 \times 6.4 = 43.20 = \text{ferrite.}$$

$$6.75 \times 443.20 = 49.95 = \text{pearlite.}$$

Now

$$100 - 49.95 = 50.05 \text{ per cent.} = \text{excess ferrite, usually taken as 50 per cent.}$$

Right here attention may be called to the very reason why in cast iron it is the condition of the combined carbon and the total thereof that renders the cast iron soft to work and reliable in service, although, as before stated, the graphite will be a maximum for a fixed total carbon content, under the very conditions that render the excess ferrite equal or nearly equal to the pearlite.

It has been said that the fixed carbon in the cast iron for cylinder work should not exceed 0.75 per cent., and it will be obvious that any increase in the fixed (combined) carbon will be at the expense of excess ferrite because excess ferrite decreases as the total combined carbon increases, which to illustrate, an example may be taken involving, say, 0.75 per cent. total combined carbon.

Hence:

$$.75 \times 15 = 10.25 \text{ cementite.}$$

And

$$10.25 \times 6.4 = 65.60 \text{ ferrite.}$$

Therefore:

$$65.60 + 10.25 = 75.85 \text{ pearlite.}$$

And

$$100 - 75.85 = 24.15 \text{ per cent.} = \text{excess ferrite.}$$

At a glance it may be seen that by increasing the combined car-

SUBJECT: GRAY CAST IRON  
 NUMBER: X MARK: \_\_\_\_\_  
 FROM: MERCEDES CYLINDER  
 NEW YORK 4-17-07

THE PHOSPHOROUS WAS NOT NOTED.  
 THE SULPHUR EXCEEDS THE LIMIT.  
 THE SILICON EXCEEDS THE LIMIT.  
 THE MANGANESE IS WITHIN THE LIMIT.  
 THE COMBINED CARBON IS WITHIN THE LIMIT.

bon to 0.75 per cent., the excess ferrite fell off 24.15 per cent., whereas with the 0.45 per cent. carbon the excess ferrite was 0.50 per cent.

If excess ferrite is increased by decreasing the combined carbon, it might be argued that the fixed carbon content might be reduced to a low point, far lower in fact than the stated desired limit of 0.75 per cent. Unfortunately for any such theory, two things are against it.

- (a) Combined carbon adds strength in some proportion to the amount present.
- (b) Graphite enmeshed reduces strength in some proportion to the amount present.

Were no graphite present, the combined carbon would add about 800 pounds per square inch for each 0.01 per cent. of the same present and the then steel would be far stronger than cast iron with the same value of the combined carbon, and the relations of strength in the two products would approximate the following:

TENSILE STRENGTH IN POUNDS PER SQUARE INCH.

50 carbon steel.....	105,000
50 combined carbon cast iron.....	25,000

True, the tensility of the respective products might vary over broad ranges for various specimens and reasons, but the relation holds, nevertheless, for both products can be varied equally in per cent.

Cast iron holding about 0.10 combined carbon would have a tensile strength of not far from 15,000 pounds per square inch, if the total carbon be the same as in the case of the 0.50 per cent. combined carbon above cited. In this an illustration of the ills of excess graphite is quite apparent since a loss of 2-5 of the tensile strength is a good approximation.

Any attempt, then, to solely attribute good qualities and softness to excess graphite must be regarded as on slim grounds, nor would low combined carbon be a desirable condition. What seems to be best is that quality of combined carbon that holds excess ferrite about equal to pearlite, and if this contention can be substantiated, carbon (combined) should not exceed 0.50 per cent.

The relation of combined carbon to graphitic carbon would seem to be of great importance, for with a low value of the total carbon, low carbon seems to afford a good strength but good castings are not assured. For cylinders, good castings must be of the first importance, and on this account adjusting the relation of graphite to combined carbon, with a view to depressing the total and the combined carbon, holds out no great promise.

This phase of the subject, then, is not one for more than mention, but the combined carbon can be as low as 0.0275 per cent. with the total carbon as low as 2.75 per cent. and still realize fully 25,000 pounds per square inch tensile strength, but the silicon would be very high in such products and the fluidity would be the only claim to be made in its favor.

If, then, the question is to be confined to the question of automobile cylinders, pistons, etc., it will be of no avail to discuss the uses and advantages of high silicon, low combined carbon mixtures, or in fact any of the many variations that could be brought about, provided assurance be given that no such variations would evolve better cylinder castings than those obtainable under the conditions fixing the limits of the components as herein before given with the understanding that within the given limits certain variations will obtain for diverse reasons, as:

- (a) differences in the "pig" iron.
- (b) differences in the "scrap" iron.
- (c) differences in the relation of the "pig" to the "scrap."
- (d) differences in the fuel.
- (e) differences in the slag forming part of the charge.
- (f) differences in the cupolas.
- (g) differences in the blowers.
- (h) different management.
- (i) different time of teeming.
- (j) position of the part of the charge used for cylinders, the first and last of the charge being the least desirable.

All these sources of variations are besides the question of gating, patterns, cores, sand, the "gaffer" and the rest.

If variations will be likely, the question of the effect of variations should amount to something more than to be disregarded. Briefly, the effects of the components besides carbon can be set down, viz.:

Phosphorus causes weakness to combat shock loads, and is manifested in the way of a decided "cold short" tendency that cannot be disregarded.

The ills of phosphorus are more apparent with high combined carbon than with low, so that decreasing phosphorus should be the rule with increasing combined carbon. In special automobile steel, for illustration, the phosphorus is fixed as a decreasing value with increasing carbon.

Phosphorus, fortunately, has a certain beneficial effect by way of producing good castings, and the aim should be to fix the phosphorus at a point giving the advantages of its presence, yet withal so low as not to render the casting "cold short." In the finished product this value is fixed as 0.50 per cent., which in itself limits the phosphorus content in the pig as that amount leaving not more than 0.50 per cent. in the casting. Phosphorus seems to afford, not so much fluidity, but the property of remaining fluid. To what extent phosphorus affords this property is not so well defined, since silicon seems to argue fluidity itself, and on this account silicon is likely to abound in castings in excess of that amount considered desirable from the purely strength point of view. Phosphorus has the property of reducing shrinkage and this in itself is a desirable property, since intricate castings, in the event of excess shrinkage, would alter their section, in compressing cores, or leave dangerous internal stresses.

Phosphorus in iron abounds, as a rule, in excess of the requirement, and the real problem is to limit phosphorus rather than to make any effort to render it high enough to afford the due measure of the good that it holds in its qualities.

In cylinders or other castings of an uneven thickness of walls or with large bosses or other protuberances, the phenomenon of unequal cooling must of course be taken into account, and two evils are likely to obtain as a result. \* \* \* \*

# COMPLICATIONS OF LIMITED FUEL RACES

**R**UNNING an automobile race on a limited supply of gasoline at first sight appears to be an affair of angelic simplicity. The same amount of fuel is poured into each tank and that is the end of the matter. In practice, however, the simple method is not simple at all, but one far more complicated and difficult of application than the old regulations under which each car, after being brushed down and having its tanks emptied, had to be put on the scales, have all its parts verified, sent to race, and put through the same close inspection when its day's work was done. The Automobile Club of France made the experiment in this year's Grand Prix and will continue it in the Press Cup race, but has already decided that, notwithstanding good technical results, the trouble is too great for every-day usage.

Gasoline, like other bodies, is variable according to the temperature, and, after deciding that fifty gallons shall be allowed for the race, the question of density comes up for settlement, as well as the problem of how to supply every machine with fuel of the same value. For it is evident that if one car were filled with gasoline at 10 degrees it would be in a better position than one having been given the same number of gallons at 24 degrees. By

dilation the gasoline would have increased in volume for a difference of temperature of fourteen degrees to the extent of more than five pints.

In order that every competitor should receive the same treatment, a very special type of tank had to be constructed for measuring the gasoline allowance to the Grand Prix racers. The work was entrusted by the racing board and technical committee of the A. C. F. to the Alpha Company, the

FIG. 1.—Elevation of fuel-measuring apparatus.

French firm of searchlight and automobile lamp manufacturers.

The accompanying illustrations, which are reproduced from *Omnia*, show the nature of the measuring apparatus, five of which were used on the Dieppe circuit, three being for the Grand Prix machines and two for Sporting Commission cup racers. A metal gasoline tank (A) is mounted on stout trestles (T) and has an outlet at its base through the tap *a*, to which is connected a flexible tube with the cock *b* at its extremity. On the upper part of the apparatus is fixed a collar (C), on which rest a funnel (E) and a cylindrical volume regulator, which for the convenience of description might be called a compensator. The lower part of the funnel E had an outlet shaped to fit the mouth of the tank, and has a volume calculated to receive ten liters at a time, gasoline in France being uniformly handled in stores and garages in sealed cans of this capacity.

The compensator F, 7.2 inches in diameter and 12.2 inches in height, was constructed in such a manner that a variation of volume of the 231 liters of gasoline in the tank, due to either increase or diminution of temperature by one degree, correspond to a correction in height of ten millimeters. This correction had been calculated on the apparent co-efficient of dilation of gasoline contained in a galvanized iron tank.

To give each car its 231 liters (about fifty gallons) of gasoline to which it was entitled for the race, the following process was

gone through: Cocks *a* and *b* being closed, the temperature of the gasoline ready to be poured into the 231 liter tank was obtained by means of a special apparatus, which will be described later, and the compensator F raised or lowered in the mouth of the reservoir A in such a way that the figure corresponding to the

FIG. 2.—Funnel and volume regulator.

FIG. 3.—Compensating scale.

temperature could be read by the scale R attached to the compensator and the cross-member K, placed on the guide from H, as seen in Fig. 3. A key (L) then held the compensator in position, this operation increasing or diminishing the volume of the tank, according to whether the temperature of the gasoline was higher or lower than 15 degrees.

When the gasoline began to appear in the mouth of the funnel the temperature was again taken, and, should there be any variation, the necessary correction of volume was made by means of the compensator. The thermometer was then withdrawn and the tank filled until the fuel was level with the top of the inlet G. An overflow leading to a tank on the ground allowed of the tank being filled very accurately. All that now remained to be done was for the two cocks to be opened and the gasoline allowed to flow into the tank of the car and the special reserve cans provided for each entrant. A complete emptying of the measuring tank was assured by its conical base. Provision was made for straining the gasoline by a fine gauze in the base of the funnel, with a metal grating above it to prevent deterioration.

For a long time the technical committee was unable to find an instrument which would give an accurate reading of the average temperature of the mass of liquid. The apparatus finally adopted was a mercury thermometer T (Fig. 4), with graduations marked on its stem, contained within a copper cylinder C, and passing through the cork plug B. Two other openings were made in the cork plug, one serving for the passage of a copper tube A eight millimeters in diameter, and descending almost to the base of the instrument, and the other an opening four millimeters in diameter for the passage of gasoline. The thermometer was maintained by a stay at F and the apparatus provided with a chain sufficiently long to allow it to be dropped to the bottom of the

FIG. 4.—Thermometer.

tank. When the instrument was drawn out of the tank the gasoline which had passed in through the tube *A* ran out through the hole *M*, bathing the thermometer in its passage and recording the average temperature of the liquid without any evaporation whatever.

In addition to the measuring apparatus it was necessary to closely examine the interior of the gasoline tanks of the cars for hidden fuel. For this purpose a special electric lamp was devised and attached to the end of a flexible cane in such a way that it could be made to explore every corner of the tank. The eyes of the controllers not being as flexible as the canes, other rods were supplied with cotton pads at their extremity, which, being pushed around in every quarter of the tank, gave additional assurance that no gasoline remained within.

Everybody was satisfied at the manner in which the gasoline allowance was distributed, each detail being worked out so carefully that there was no possibility of cheating or unjust treatment. It is a delicate operation, however, and unless there is a perfect organization races run under this basis are likely to give rise to endless controversies. The French club was so unanimously of opinion that the method would give rise to difficulties that it was decided not to use it after this year.

### CUSTOM REGULATIONS GOVERNING AUTOS.

WASHINGTON, D. C., July 30.—Collectors of Customs have been notified by Assistant Secretary of the Treasury Reynolds that new regulations governing automobiles taken abroad by tourists have been formulated. The new regulations provide that the owner of an automobile of foreign manufacture on which duties have been paid may, after its identification and the issue of a certificate by customs officers, on his application, take it abroad for touring purposes, with the right of free entry on its return with him, or within thirty days thereafter, provided that no repairs, improvements or additions were made to the automobile, except absolutely necessary repairs costing not more than 10 per cent. of the original appraised value.

Accessories of foreign manufacture will be exempt from duty in connection with the automobile, provided that it shall be established that they were the ones taken abroad under the certificate. If the certificate covers a set of foreign tires, it will not be necessary to prove that the tires brought in on the wheels were those taken abroad.

Certificates will be issued, on request, for automobiles of American manufacture and their accessories, and such automobiles, whether or not under certificate, will be admitted on their return, free of duty, provided that they shall not have been advanced in value or improved in condition, and that all repairs thereto were absolutely necessary and did not cost more than 10 per cent. of the original price of the car. The further provision is made that it shall be shown that the accessories are those taken abroad under the certificate. Such repairs shall not be deemed an advance in value or improvement in condition within the meaning of Section 483 of the Tariff Act. Duty will be charged on any accessories of foreign manufacture which shall be substituted abroad. Foreign tires taken out on the wheels of automobiles may be brought back free of duty.

The regulations further prescribe that the owner must make oath and the Collector of Customs must be fully satisfied that they come within the regulations before any such automobiles and accessories shall be admitted free of duty. In case of the unavoidable absence of the owner when an automobile and accessories are entered either under a certificate, or without one, or entered as household effects, the duly authorized agent of the owner may give a bond in amount equal to double the estimated duties condition for the production to the Collector within sixty days from the date of entry of evidence to the satisfaction of the Collector, with the oath of the owner that they are entitled to free entry. This bond may be extended by the Collector for a total period not exceeding six months.

### INDEPENDENT CLUTCH CHANGE-SPEED GEAR.

One of the most obvious methods of overcoming the very objectionable necessity of sliding gears into and out of mesh while revolving, which constitutes the chief drawback of the style of change-speed gear now in present use, is to design the mechanism so that the relative position of the pinions remains unchanged while they are brought into and put out of action by means of independent clutches. This expedient naturally suggests itself at once and it has been tried in numerous instances, but not with that measure of success that it would seem to hold at first sight. The accompanying illustration depicts a novel modification of the idea, employing conical clutches operated in a manner somewhat similar to that known as the selective type of gear-changing. It will be noticed that the high speed or direct drive is thrown in by means of a lever which is also connected to the clutch just below it on the countershaft at the left, so that throwing in the high speed disengages this clutch, leaving it, as well as all the remaining pinions, idle. As shown in the illustration, the gear is set to give the first or slow speed, the spring shown on the countershaft being employed to allow additional motion of the rack into reverse, as the latter is controlled by the same rack. The claims of the patentee, Frederick S. Leonard, Jewett City, Conn., permit of several detailed modifications, which may be embodied in the device should experience show them to be su-

SECTIONAL PLAN VIEW LEONARD CHANGE SPEED GEAR.

perior to those shown in the drawing. For instance, the hexagonal faces of the clutches shown might be replaced by conical, corrugated faces, thus doing away with all square corners, with their tendency to wear round and slip in time. Another type of individual clutch which may be substituted if thought fit is shown in section in the upper left hand corner. It is a simple and positive lock, the clamps for engaging the square sections of the shaft having extensions passing through the pinion on a curve, so that when released the helical springs force the clamps out and the curved groove lifts them clear of the shaft. When pressed into place by the sliding block on the shaft they instantly lock the pinions to the shaft and, being reinforced by the sides of the wheel, no serious strain is brought upon any particular part of the mechanism. The shaft can be made round and in one piece, while the short section of square shaft needed under the clamps can be slipped on and keyed to shaft proper. The sliding block is left free, so that only that particular part of the gear set that happens to be in service at the time is revolving, all other parts remaining idle.

One of the last things that the amateur driver learns to let alone is the carbureter. He seems to regard a bit of adjustment here and there, particularly where the gasoline flow is concerned, as a sort of panacea for all the ills of irregular running. In many cases the original trouble is wholly imaginary, but a little inadvised tinkering with the carbureter adjustments makes it real in a very short time, so that it pays to let the carbureter alone except when it is obviously at fault.

## LETTERS INTERESTING AND INSTRUCTIVE

### Various Types of Pumps Employed on Automobiles.

Editor THE AUTOMOBILE:

[839.]—Will you kindly let me know through Letters Interesting and Instructive, the following: How many kinds of rotary pumps are there in use beside the gear pump and the type used on the Pierce-Arrow that are employed as circulating or lubricating pumps and kindly describe the principles of each type briefly.

Also the following with reference to the fans ordinarily employed to assist in cooling the motor. How is the volume or amount of air put in circulation by such a fan calculated? That is, the fan formed by the spokes of the flywheel and forming a part of the latter, as well as the independent fan placed directly behind the radiator, when both the dimensions of the fan and its speed of rotation are known.

AUSTIN M. WOLFF.

Stamford, N. Y.

There are three types of rotary pumps in general use on the automobile, the gear-pump which you mention, the centrifugal pump and the rotary pump. The principle of the gear-pump is practically that of the piston or plunger pump in which an increase of volume, *i. e.*, the receding of the piston draws the liquid into the pump and the decrease of that volume by the return of the piston forces it out. In the gear pump the volume is increased and decreased alternately as the pinions revolve. As its name indicates, the centrifugal pump depends for its action on centrifugal force; in the gear pump the liquid enters at one side and leaves directly opposite, while in the centrifugal pump it enters at the center, the pump housing being circular. The water strikes the center of the moving member of the pump, which revolves at high speed and is thrown to the circumference by centrifugal force, the outlet being placed at the top of the casing. The rotary pump works on the principle of the simple waterwheel; its spindle carries a number of vanes, the water entering at one point on the circumference of the housing and leaving at another diametrically opposite, the former usually being at the bottom so that this pump is practically an undershot water wheel except that being driven by power and confined in a casing it carries the water round with it and out at the top, instead of being impelled by it. The centrifugal pump is the type most generally used on automobiles with the gear type next in favor, the rotary not being often found on present-day cars.

The method of calculating the volume of air delivered by a fan will be found in Kent or other engineers' pocketbooks under this heading, but the data is too voluminous for reproduction here. While there are doubtless exceptions, we are under the impression that the average fan used on the automobile is largely a matter of guesswork and that neither science nor overmuch calculation enters into its makeup. The same applies to the flywheel fans you mention, though we understand that this is a matter that is now coming in for considerably more attention at the hands of the designer than it has hitherto been customary to devote to it. A fan was a fan and that was all that was necessary owing to the relatively minor rôle it was called upon to play in the power plant.

### Inquiries About the Holley High-tension Magneto.

Editor THE AUTOMOBILE:

[840.]—Some weeks ago I read an account of the Holley system of ignition in "The Automobile," in which it is stated that an electric condenser is employed in connection with a magneto. Can you give me the maker's address, as well as the number and date of his patents covering this system?

ARTHUR GRAHAM.

New York City.

You will find the announcement of the manufacturers of the Holley magnetos in our advertising columns and we would refer you to them direct for the information you desire. If you do not wish to correspond with them on the subject, the data you inquire about is a matter of public record and can be found by looking back through the *Patent Gazette*, which is kept on file at public libraries such as The Astor.

### In Settlement of Two Disputed Questions.

Editor THE AUTOMOBILE:

[841.]—Perhaps you will be good enough to settle an argument I have had with my chauffeur. We have had some trouble with a slipping cone, leather-faced to metal clutch. The first leather not holding, I sent for another, and on taking the first one out I found that the leather was lifeless, having been burnt up with the great heat caused by the friction.

When putting the new one in my chauffeur stated it would have to be soaked in castor oil, but I told him that we would have the same trouble again, as castor oil was a good lubricant. He assured me though that "the leather must be well soaked," otherwise it would be very "ferce," so I let him go ahead and he soaked it thoroughly and thickly with the castor oil. The first few minutes we were out we found it slipped a little, but with the increasing heat of the engine (just as I expected) the oil exuded, and in a little while it could not move the car on the level, as the engines raced and the clutch would not hold.

My chauffeur then said that the clutch was too small, but I assured him that any clutch would be too small if he put enough of oil and grease between the leather and the steel, and that the action of oil on the leather was exactly the same in every way as reducing the size of the clutch. In other words, the effect on the transmission and the engine was precisely similar, because a small clutch not oiled would slip, and a large one with oil would also, and that the same effect was produced by a weak or a strong spring at the back of the clutch, *i. e.*, that a weak spring at the back of the clutch was precisely equivalent in every way to a small clutch or a large one well oiled. Will you kindly decide if I am right in this.

Another point about which I have had some argument is the effect of a magneto. In a case where a magneto is set to spark before the piston arrives at the dead center and thereby the explosion immediately after it passes it, the engine going at, say, 1,000 revolutions per minute, would not the explosion come when the piston is on the dead center if the engine was running very slowly?

My argument is that there is an instant of time between the spark and the explosion, and in that time the piston travels a more or less distance, according to the speed at which it is going.

My chauffeur holds that as the spark is set by the position of the piston, then the explosion must always take place with the piston in the same position, whatever the speed, and, therefore, if it does not explode on the dead center when the engine is running at 1,000 revolutions per minute, it could not take place there when the engine is going at 100 revolutions. Which is right?

Thanking you in anticipation for your kind reply.

Toronto, Can.

AMATEUR MECHANIC.

Regarding the first matter in dispute, while castor oil is a good lubricant, it also has the peculiar property of causing a leather surface to adhere to metal and on this account is largely used, or was in former years to apply to slipping belts in factories in order to make them cling to the cast-iron pulleys on the shafting. In fact, it is a belt-dressing of many years' standing and has long been used to keep the leather from drying out and becoming hard. There is little doubt that a leather clutch facing which was given a preliminary soaking in castor oil would not only act better but would be apt to prove more durable in the long run. It is only natural that a large part of the oil should be forced out in operation but sufficient would remain to keep the leather in a more pliable condition than if it were used dry. It would seem as if the trouble lay in a weak spring rather than in the facing of the clutch. On the other hand, you are quite correct in holding that the clutch, *i. e.*, the male member of it, is not too small, as if this were the case it would have been a source of trouble from the outset. Such a clutch would be apt to slip under any circumstances, but putting castor oil on a clutch of the proper dimensions should not cause it to slip once the excess oil has been squeezed out of the leather. The "increasing heat of the engine" to which you refer is not a factor in such cases ordinarily, as the clutch is situated sufficiently distant from the engine not to be appreciably affected by its heat. The heat which did the damage was that of the friction generated between the slipping leather face and the flywheel recess of the clutch, a state of affairs which, under the

circumstances, points to the presence of a spring that is not sufficiently strong to seat the clutch properly so that it will slip and cause trouble whether oiled or not.

A magneto is usually set to run synchronously with the engine to which it is attached and in timing it with the latter allowance is made for this difference in the time of the occurrence of the spark at the magneto and that of the explosion, which, though appreciable, would be a difficult matter to measure and constitutes but a small fraction of a second. However, as the piston of a motor turning over 1,000 r. p. m. can travel quite an appreciable distance in the same period of time, the necessity for the allowance will be appreciated. The position you take is quite correct, though you are probably not aware of the basis for it. This is to be found in the fact that the magneto is said to "build up" as its speed increases. Technically speaking, both its current output and its potential rise proportionately with an increase in speed, and particularly the latter. In other words, it acts much more quickly at a high speed than when turning over slowly, as is true of all current-generating machinery. This being the case, if the magneto were timed to fire the charge at a position corresponding exactly to the upper dead center of the piston when the motor was only turning over at 100 r. p. m., the charge would be fired considerably in advance of this point when the motor was running at 1,000 r. p. m., and this is exactly what is desired, as the piston naturally travels a much greater distance in a given space of time when running at high speed than it does at a low speed. The occurrence of the same interval at the higher speed as takes place at the lower rate, would naturally cause the piston to run away from the spark, so to speak, which would have to be counteracted by setting the spark advance lever further forward.

#### A Loose Piston Pin Caused This Hammering.

Editor THE AUTOMOBILE:

[842.]—Some time ago I wrote a letter (822) to "The Automobile" asking you for information which might lead to the discovery of a hammering noise in my engine that was troubling me. I gave as full an explanation as possible, but doubtless it was not entirely clear or you would have been able to locate the trouble. However, I had found my trouble before your reply was published and had reached me, so thought it might be of interest to you and to any who might be troubled that way to know where the trouble was and how we located it.

After examining the engine as closely as possible, we found which cylinder was the center of the trouble, then removed it so as to be able to get at the connection of the piston in an easy manner. We found upon further investigation that the piston pin was loose, giving enough lost motion to cause considerable of a pound and also a great loss of power. We took up the lost motion by removing the pin and pounding the same very hard on one end, the other end placed on a solid vise. This treatment enlarged the pin sufficiently, so that there was no more lost motion. From that time the engine has run fine and has the original amount of power.

I would like to make another inquiry and hope you can give me some assistance through your Letters Interesting and Instructive. I will try and give a good description of the trouble. I have a Model C Ford 10-horsepower engine, double cylinder. The engine has been in use for three seasons. The engine is doing as good work as I could expect, but the valves seem to make an unusual and unnecessary amount of noise. Is there any way whereby this could be improved on or stopped?

Tracy, Minn.

C. B. PARTRIDGE.

While our diagnosis of some of the problems submitted us for solution frequently goes wide of hitting the mark, this would hardly seem to be true in your case, as if you will refer to our answer to your former letter you will find that the opening sentence of this stated as explicitly as we could make it do so, that, in our opinion, the trouble was caused by looseness at either end of the connecting rod where it joins the crank pin or the piston pin. Your description was perfectly clear and, as subsequent events prove, we did locate the trouble, mentioning, moreover, that your statement of the case was an "almost certain indication" of the cause you discovered to be at the root of the trouble. We are glad to hear that you were able to find it and apply the remedy before our reply reached you, and the manner in which you made

it good may prove of interest to others, although the method employed was decidedly crude and rather to be avoided than patterned after in similar cases. If after upsetting the pin in the manner you describe it had been turned down true to its bearing again, no fault could be found with the repair, but the use of a brass bushing would have made a better job where lath work was not convenient.

Regarding your second inquiry, probably the only way to bring about an appreciable reduction in the amount of noise caused by the valves of your engine would be to replace them with new ones, as the trouble is doubtless due to the fact that the valves have been worn considerably by grinding in and the tappet ends have also worn, the first permitting the valve to drop much further before reaching its seat and the latter bringing the tappet and push rods together with more noise owing to the increased distance between them.

#### Spur and Bevel Gear Differentials Compared.

Editor THE AUTOMOBILE:

[843.]—Will you kindly explain in the columns of your valuable journal the advantages and disadvantages of the spur gear and the bevel gear type of differentials? I have noticed that some machines which otherwise are constructed greatly the same differ in the type of differential, and each dealer claims that his is the only type of good construction. One dealer told me that many manufacturers who had tried the spur gear had gone back to the bevel gear. Why the spur gear is not an improvement over the other in not having the tendency to push the case apart is beyond me, so I have referred the question to your higher court.  
Minneapolis, Minn.

RAYMOND O. WEISS.

The bevel type of differential is very generally used nowadays except on small, light cars, and there are several reasons for preferring it. Chief among these is the fact that some relative movement of the driving axle of a shaft-driven car is bound to take place; that is, under the stress of passing over rough roads the two halves of a live rear axle are compelled to assume slightly different planes instead of remaining in the same plane as when standing. Considered as one piece, the axle may be said to bend at the center. Bearing in mind the nature of a spur-gear differential, it will be apparent that under such circumstances the small pinions lying parallel with and meshing with the large pinions on the ends of the axle as well as with each other, will tend to bind. If there be sufficient relative movement of this kind between the two parts of the axle this binding will naturally become a serious factor until it reaches a point where the teeth strip.

This brings us to another advantage of the bevel type—the latter will not only automatically compensate for any amount of this so-called bending short of actual destruction, as it rolls round a point, but it is also proof to a much greater extent against stripping of the teeth as the design of the latter permits of their being made with a larger cross section. The bevel differential is much more silent when new and it maintains this advantage throughout its useful life as wear may be compensated for by adjustment, bringing the bevels and the members with which they mesh into closer contact to the extent to which they have worn. The dealer who told you that makers who had tried the spur type had later abandoned it in favor of the bevel was quite correct. Regarding the tendency of bevel gearing to push the engaging members apart, in this instance, the sides of the housing, this is readily overcome by the use of suitable thrust bearings, usually of the annular ball type and very little difficulty is experienced on that account. Thus the bevel differential has the advantages of greater efficiency, greater freedom from accident and silence in its favor, while it may also be made more compact.

#### Who Is the World's Greatest Racing Driver?

Editor THE AUTOMOBILE:

[844.]—Not long ago a friend and myself had an argument as to who was the world's greatest and most skillful automobile driver. My friend claims that Duray, the driver of the De Dietrich, is the most skillful in the handling of a racing car. Now I claim that Oldfield, though not a road driver, showed more skill in his races

on the local tracks than Duray or any of the other foreign drivers in the Vanderbilt Cup races. I base my argument on the fact that I watched the foreign drivers closely as they swung round the "hairpin" turn in the last cup race for the express purpose of comparing their driving with that of Oldfield, and my conclusion was that Oldfield was the most skillful. I would like your opinion on the matter. A reply through Letters Interesting and Instructive will be appreciated.

A. W. LARKINS.

New York City.

Like similar questions concerning the most popular or the most beautiful actress, this is entirely a matter of personal opinion. The work of many of the foreign racing drivers shows masterly control of the car at high speeds and in bad places such as are not encountered in track racing, but opinions both as to the relative merits of different road racing drivers and their skill as compared with some whose sphere is confined to the oval, are so numerous and so conflicting that it would be a waste of time to attempt to reconcile them. We cannot lay claim to being an authority on the subject, nor can we refer you to any higher tribunal.

### SOME INFORMATION FOR NUMBERS 797 AND 772.

Editor THE AUTOMOBILE:

[845.]—I note your reply to letter No. 797, C. C. Cross, in the issue of June 27, and it is possible that the matter might be stated in another way which may help him to understand the matter. Simply bear in mind that the term "point" means one one-hundredth part of one per cent., or one ten-thousandth part of the total mass. In the case which he cites this would be spoken of as 45-point carbon, it would mean that the carbon content was forty-five one hundredths of one per cent., or not quite one-half of one per cent. The sulphur is one and seven-tenths points, or seventeen thousandths of one per cent. The nickel is one hundred and seventeen points. As points indicate hundredths, it is readily seen that when coupled with the term points we read the first two figures to the right of the decimal point, as whole numbers indicating the points, and when there is a third figure, as is the usual case when sulphur, phosphorus, manganese, silicon and other elements are spoken of, it means tenths of a point. In all good metallurgical test work all elements are figured to tenths of a point, and it should be done in every case requiring accuracy.

In the matter of physical properties, Ex-4" means the extension in the length of 4". In this instance it is eight and one-quarter per cent.; in other words, it means that a space which was 4" long stretched out to 4.33" at time of rupture. As to the second abbreviation I see where he took it from and consequently he is not at fault, but what is intended, and the proper term to us is reduction of area, it refers to the cross-section of the test piece and has nothing to do with the length. As an example we will assume that the test piece was a round bar  $\frac{3}{4}$ ", or .750", in diameter. The area would then be .441787", we then pulled it to rupture and found the diameter at the break to be .7133", this would be an area of .399273", the reduction of area would be .042514", or nine and one-half per cent. It might not be amiss to say that the first abbreviation should be elongation instead of extension.

This matter of a 4" test piece brings up another phase of this question which is of interest, and it is hard to understand why some persons in the automobile industry are so ready to ignore the facts which the experience of years has taught. We test metals to secure facts, and it has been found that short pieces are misleading, the 8" test piece has become a standard. We must not lose sight of the fact that when a test piece is pulled it never pulls evenly, its main elongation and reduction takes place in a space of about two inches in the center of the specimen; this being the fact, it is readily seen that a 4" test piece gives us a wrong percentage of elongation.

In your issue of June 6, letter 772, the keyseat for a Woodruff is cut longitudinally, the same as for any other key. The "Rites" governor represents the best practice in modern high-speed steam engine work. The Corliss gear is not adapted to high-speed work, and the study of engineers to produce a gear which could be run at high speeds resulted first in the centrifugal governor, where weights in the flywheel are connected with the eccentric in such a manner as will change both its location and throw, and consequently the length of time that steam is admitted to the cylinder. The next step in this line was the "Ball" governor; he placed the belt wheel on the shaft so that it was free to revolve a certain amount, the spring of the centrifugal governor was attached to this wheel in such a manner as to pull it against a stop and in a direction contrary to the pull of the belt; under normal conditions the centrifugal governor controlled the speed of the engine, a heavy load resulted in a harder pull on the main belt, it rotated against the spring, increased its tension and consequently opened the valves. When this engine was first placed on the market it

created quite a sensation, as its makers advertised that they were ready to install an engine which should run at constant speed regardless of load, or run faster when under a load than when running light; this was in direct opposition to all facts known in practice at that time, the loose wheel was an objection, but it is quite presumable that this was what started the train of thought that resulted in the "Rites" governor.

The "Rites" governor combines the effects of centrifugal force and also inertia; under a given load and normal conditions it controls the valve action the same as a centrifugal governor; when any sudden load, or reduction of load, comes on the engine, the inertia effect comes into play. I have never known of its being applied to gas engines aside from Thompson & Sons, Beloit, Wis., and I know nothing regarding the results they have secured, but they claim to regulate within two per cent.; they build quite large engines.

EDWARD F. EDGECOMBE.

Cuyahoga Falls, O.

### TO THE POINT ABOUT ALUMINUM CASTINGS.

Editor THE AUTOMOBILE:

[846.]—In "The Automobile" of July 18 there is an article on this subject by E. Blough that is the type of article that makes serious engineers so very, very tired. What real information is contained in it? His "say so" that his company can or has made castings having the characteristics given in the article does not amount to a "hill of beans" so far as real definite information is concerned. Why not give the composition, foundry practice and actual test records of specimens?

First we have a well-known engineer giving 9,000 pounds per square inch as the safe tensile strength to figure on. Then a prominent foundryman writes an article and says, in effect: "You're away off, old chap, we can give you castings with three times the strength of your rotten old test pieces and a real, live elastic limit; you surely got a 'bad one.'" Then, again, I know that this year another prominent foundry gave a well-known automobile manufacturer a fine lot of "punk" gear boxes, all of which have been renewed at the W. K. A. M.'s expense. In view of the above, "where are we at" on aluminum castings. Personally, I am side-stepping the question by using bronze, and incidentally keeping out of the bunco game.

There seem to be only two ways of getting good aluminum castings with certainty; either have your own foundry, or keep a bribe-proof, high-priced metallurgist as inspector at the foundry to watch every melting and pouring.

Mr. Blough's article is of the kind that says "now, I know, and you do as I say," but we have been "done" so often and so regularly on aluminum castings that articles like this only serve to create additional distrust and force us to an increased use of bronze.

E. T. BIRDSALL.

Rochester, N. Y.

### SHORT-CIRCUIT TRACED TO THE COIL BOX.

Editor THE AUTOMOBILE:

[847.]—I have just had an experience that may interest your readers. I was driving my four-cylinder car in a rain storm and after driving about five miles two cylinders misfired, and a hasty examination showed all vibrators working, clean spark plugs, commutator in good order and carbureter in the same condition. I was pretty confident that the trouble was merely of a minor nature—some of those little things that defy discovery at the time and which are all the more exasperating on that account—but one is not overmuch tempted to "fight it out on this line" on a black, rainy night when more or less in the dark in every way and even that most ignominious ending to a run, a tow, is a welcome relief.

After running a few miles on two cylinders the engine died entirely, and with all vibrators still working, disconnecting the terminals from the plugs and holding them near the plug ends, or close to the cylinder heads would not show anything but a suggestion of a spark, though at times I would receive a shock when handling the secondary wires close to the top of cylinders. At this time, it being in the night and raining, I naturally thought of broken wires or broken down insulation, as others have said was the fault when I have told them of the symptoms, and I sent for help and was taken in tow and brought home.

This morning I went over the wiring and found that two cylinders were in order, but noted that the plugs of the two cylinders that were not firing, when laid on top of the cylinders, each gave a faint spark simultaneously, which was an indication of a short circuit between them, and took one of the units out of the coil and found it wet at the bottom. This proved that the rain had penetrated the coil box in some way, causing the two coils to short-circuit by reason of the water forming a contact between them.

Such a condition is so unusual and baffling that I thought it would be worth while to mention it, and it may save someone else from being towed in if they remember reading about it.

Lindsborg, Kan.

A. E. AGRELIUS.

**S**OUTHERN Ohio is now the home of a line of commercial vehicles which in the course of the next season or two should prove eye-openers of no uncertain sort, provided their attainments measure up to the promise given by the first ones of their kind. They are built by the Commercial Motor Truck Company, Plymouth, O., and are known as the Plymouth cars. The power plant of the chassis at present being turned out consists of the well-known Rutenber four-cylinder motor with 5 by 5-inch cylinders. Ignition is of the high-tension type, employing a set of accumulators as the source of current, a Splitdorf multiple-unit coil and timer comprising the accessories, while the essential of lubrication is taken care of by a Hancock valveless automatic force-feed oiler, leads being taken to each of the cylinders independently as well as to the main bearings. In designing this power plant every effort has been directed toward making it the acme of simplicity in view of the service and lack of attention it would have to endure, as commercial trucks and sight-seeing cars more often than not fall into the hands of drivers who have but little appreciation of the needs of a piece of machinery such as an automobile motor. With this end in view every possible source of breakdown has been eliminated throughout, not alone the motor but likewise every other part of the car, so that a Plymouth truck may be placed in the hands of an inexperienced driver without fear of being stalled through petty defections, which, though never serious, nevertheless bring the car to a stop and cause a considerable loss of time as well as the services of a more expert attendant to go and supervise the repair. The liability of a truck to such failures also proves a potent attraction to the inexperienced hand to tinker, thus making the trouble far worse and frequently entailing other and more serious derangements than the initial cause of stoppage, which is often trivial.

The chief feature of the Plymouth cars lies in their transmission. This consists of two friction disks located just in front of the rear wheels and mounted on a shaft connected directly with the engine through the medium of two uni-

versal joints to compensate for any relative movement of the shaft and the body of the car. These disks are of cast iron, 25 inches in diameter and are faced with a  $\frac{3}{8}$ -inch layer of aluminum alloy. Two friction-driven wheels are situated directly between the two disks just described, each being mounted on an independent shaft, and both being brought into contact with the friction wheels simultaneously. The rear disk is employed entirely for the forward speed and the other for the reverse. These friction wheels have their circumferences or contact surfaces equipped with a specially prepared tar filler, manufactured under great hydraulic pressure, and which when brought into contact with the aluminum alloy has an extremely high coefficient of friction, thus enabling the device to transmit a maximum amount of power without slipping with a minimum area of surface in contact, and likewise with a minimum of pressure between the contacting surfaces, thus rendering them far more durable than would otherwise be the case. The friction wheels are forced against the disks by means of a pedal.

Since these driven wheels are mounted on independent shaft and both are in contact with the same disk at the same time, they must necessarily revolve in opposite directions in order that the sprocket chains running from this divided shaft and which form the next link in the transmission of the power, will travel in the same direction. To accomplish this the sprocket on one side of the car, as shown in the full length chassis view, is driven by a spur gear operated from the divided shaft. It will further be seen that the power is transmitted from these sprockets to a corresponding pair somewhat larger in size, situated directly over the rear axle. These sprockets drive a countershaft at the center of which is an enclosed change-speed gear mechanism comprising sliding pinions and two large spur gears, the whole constituting a two-speed gear set giving a high and low speed. This manner of transmitting the power does away with the necessity of attaching any sprockets to the rear wheels, and the chains, moreover, are kept well up out of the mud and dirt, thus in-

CHASSIS OF THE PLYMOUTH TRUCKS AND SIGHT-SEEING CARS.

creasing the efficiency of the transmission in every-day service and making its proper maintenance an easier matter than under ordinary conditions.

Thus the Plymouth cars have two sources of high and low speed which may be used in conjunction with one another and which permit a great range of speed and power. Thus the speed of the two friction wheels depends upon their position on the face of the friction disk and they may be shifted at the will of the driver. Either speed can be used with either the high or low gear, the latter in connection with the high speed naturally being intended for heavy work and the high gear and high speed for light, fast work. The wheelbase of the vehicle, which may be fitted as an open stake truck, as shown at the head of the page, as 24-passenger sight-seeing vehicle or for any other similar commercial use, is 144 inches, tread 54 1-2 inches, the tire equipment being 32-inch single Firestone on the front and 36-inch twin Firestone solids on the rear. At present the company, which is well equipped to turn out these cars, is placing 20 to 40-passenger sight-seeing cars, 20 to 24-passenger 'buses, as well as flat and side-stake trucks, vans, and the like.

On a recent test of these sight-seeing vehicles the latter made a most successful run to Sandusky and return with a heavy load of passengers and under most adverse road conditions owing to rainy weather, some of the stretches being covered at a 20-mile-an-hour clip despite the bad going.

#### COMMERCIAL VEHICLE TRIALS IN ENGLAND.

With the view to arousing public interest in and advertising commercial motors, the Royal Automobile Club, in connection, it is understood, with the Commercial Motor Users' Association, will hold, beginning September 9, trials of commercial vehicles, which will be in the form of a tour, reports United States Consul Albert Halstead, of Birmingham, Eng., regarding the British motor industry.

Manufacturers of the best lines of motor cars are reported to be exceptionally busy and to find their orders so numerous as to frequently necessitate delays in deliveries. Motor manufacturers are now confident that the sales this year will far exceed those of 1906, which were the greatest on record.

Concerning the standardization of parts used in the construction of motor cars, it is reported that the Institution of Automobile Engineers has appointed a committee, which is preparing to make a thorough inquiry into this question. It appears to be appreciated that for some time only those accessories and component parts used on engines of all types can be studied with a view to standardization, but it would seem as if nuts, bolts, bolt-heads and wrenches also deserve consideration. One difficulty in standardization is the fact that Continental motor makers use the metric system, while manufacturers in the United States and United Kingdom do not. It is understood, also, that a committee of the Society of Motor Manufacturers and Traders is making an investigation of the question of standardization. The fact that this subject is receiving attention is certainly important as a first step toward agreements that should be beneficial to the motor manufacturers of all countries.

#### EUROPEAN HOTELS AND MOTOR 'BUSES.

The motor post-service in South Tyrol, which worked last year so successfully, is being continued this year on a larger scale, says *The Commercial Motor*, of London. For instance, visitors get the benefit of a new line connecting up Neumarkt or Tramin with the popular health resort of Martino di Castrozza, and leading over the Rolle Pass, some 6,400 feet above sea-level. The route approximates to 44 miles, and passes through some delightful scenery. Ten-seat motor 'buses, in charge of men appointed by the military officials, who are greatly interested in the development, work the line.

A DOWN-EAST RAPID DELIVERER OF CLEAN SHIRTS.

#### NEW RAPID GASOLINE BUSINESS WAGONS.

One of the great advantages of the gasoline-driven commercial vehicle is the ease with which it lends itself to an endless variety of business uses. Whether it be transporting ponderous loads at a rate of speed not attainable by any other means, the haulage of medium heavy loads at a rapid rate or light delivery at a pace unknown to the business world before the advent of the gasoline car, the latter is equally valuable and not to be compared with any other current method of accomplishing the same ends. There is another side to the question also, as where the duty does not vary between any great extremes the same standard chassis is frequently applicable to both with equal advantage, merely a change of the body of the vehicle being necessary to adapt the car to the altered service.

This is aptly illustrated by the accompanying photographs, one of which represents a delivery wagon in the service of a New England laundry, while the other is employed daily by a Chicago creamery. Both are the product of the Rapid Motor Vehicle Company, of Pontiac, Mich., and both are mounted on the standard chassis built by this firm, the fitting of a body specially designed for the service in view of being the only difference between them, and it is evident that in both cases a roomy body, capable of carrying considerable load, is employed. The laundry wagon makes a daily round of thirty miles through the suburbs of Boston, while the milk wagon is employed in a similarly strenuous occupation in the confines of the Windy City, and, considering the miles of poor pavement in the latter, there is doubtless little to choose between the duty of each. The builders of the Rapid commercial vehicles construct cars for every form of commercial service, such as hospital ambulances, piano trucks, telephone service wagons, chemical fire engines and the like, illustrating the extremely wide range of uses to which they are adapted.

RAPID GASOLINE WAGON IN THE SERVICE OF A DAIRY.

## EUROPE NOW UNANIMOUS ON RACE RULES.

OSTEND, BELGIUM, July 22.—Europe's important automobile races will next year be run under uniform rules adopted by the delegates of the international conference representing the automobile clubs of France, Germany, England, Italy, Austria, Holland, Belgium and Spain. The maximum bore for four-cylinder engines has been fixed at 155 millimeters (6.1 inches) and the minimum weight is 1,100 kilograms (2,425 pounds). In all other respects constructors are given entire liberty.

Four suggestions came before the conference: Limited cylinder area with minimum weight; limited bore with minimum weight; limited fuel consumption, and complete liberty in size and weight of engine and chassis. Germany spoke in favor of a maximum bore of 135 millimeters for four-cylinder engines, Italy asked that all regulations be abolished, makers being allowed to build what they considered the fastest machine unfettered by weight and cylinder limitations, while France asked for a maximum bore of 160 millimeters with weight limit fixed at 2,425 pounds. In abandoning the conditions governing the Grand Prix, the French delegates declared that they were thoroughly satisfied with the results obtained, but did not intend to repeat the experiment, owing to the difficulty of carrying out the rules. Under a limited fuel regulation there is always a possibility of fraud, of a good machine being eliminated by the breaking of a fuel pipe, and of the accidental breakage of the seals calling forth protests; in addition, the variations of weather make it difficult to fix upon a supply of fuel which will be universally acceptable. Their proposal for next year was 6.2 inches bore and 2,425 pounds maximum weight. After a short discussion a compromise was made between the French and German resolution, all the European clubs agreeing to run their races on the basis of 6.1 inches maximum bore and 2,425 pounds maximum car weight. Nothing was discussed regarding six and eight-cylinder engines, or those of the Gobron type.

As the result of this unanimity, automobile racing in Europe next year is likely to be much more successful than in the past two or three years. Builders will not be under the necessity of constructing several types of machines, one set now being available for the Grand Prix, the Ardennes, Targa Florio, Brescia circuit and whatever race Germany decides to organize. America was not represented at the conference, but if it is desired to obtain European entries for the 1908 Vanderbilt race the rules will have to be those of the Ostend conference, or be so framed as to admit machines built under these new conditions.

## ESPLANADE FOR PARIS AUTOMOBILE SALON.

PARIS, July 23.—A further generous concession to the Automobile Club of France has been made by the city municipality in the granting of the Esplanade des Invalides for the industrial section annex of the Salon. Last year a portion of this magnificent open space was granted to the promoters of the Salon, practically free of cost, but with the reservation that the main entrance should be kept about three hundred yards from the riverside. For this year's decennial show an area of 36,000 square yards, which is about equal to the total floor area of the Grand Palais, has been granted, on which will be built a steel frame structure. The main entrance to the industrial section will be at the extremity of the Alexandre III bridge spanning the river Seine, and only distant from the Grand Palais 160 yards. It is intended to make the external decorative effect more brilliant than ever by the erection of a monumental entrance to the annex and to connect the two buildings by a luminous triumphal arch.

Further developing his retrospective exhibition as a part of the next Paris Salon, General Manager Gustave Rives announces that there will be an exhibition of documents and objects connected with the work of some of the pioneer automobilists, among others of Daimler, Levassor, Serpollet, Forest, Lenoir, and Chasseloup-Laubat. Requests for exhibition space in the show close on August 15, the Salon opening on November 12 and closing its doors on December 1.

## THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.  
 Oct. 31-Nov. 7...—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.  
 Nov. 30-Dec. 7...—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.  
 Dec. 28-Jan. 4...—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.  
 April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.

#### Races, Hill-Climbs, Etc.

- Aug. 3.....—New York City, Fort George Hill Climb.  
 Aug. 9.....—Algonquin, Ill., Hill Climb, Chicago Motor Club and Chicago Automobile Trade Association.  
 Aug. 5-10.....—Atlantic City, N. J., Automobile Carnival, Atlantic City Automobile Club.  
 Aug. 9-10.....—New York City, Brighton Beach Track, 24-hour Automobile Race, United States Motor Racing Association.  
 Aug. 17.....—Newark, N. J., Olympic Park, Carnival of the New Jersey Automobile and Motor Club.  
 Sept. 2.....—Chicago, Harlem Track, Race Meet under the auspices of the Chicago Automobile Club.  
 Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.  
 Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.  
 Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.  
 Sept. 14.....—Hartford, Conn., Charter Oak Park, Gymkhana Games, Automobile club of Hartford.  
 Sept. 14.....—Albany, N. Y., 95-Mile Road Race, under the auspices of the Albany Automobile Club.  
 Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

#### Motor Boat Races.

- Aug. 13-15.....—Chippewa Bay, St. Lawrence River, Gold Challenge Cup Race, American Power Boat Ass'n.  
 Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.  
 Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

### FOREIGN.

#### Shows.

- Sept. 28-Oct. 7...—Denmark, Copenhagen International Automobile Show.  
 Nov. 11-23.....—London, Olympia Motor Show.  
 Grand Palais, Esplanade des Invalides, Automobile Club of France. Applications for space close August 15.  
 Nov. 12-Dec. 1...—Paris, Exposition Decennale de l'Automobile.

#### Races, Hill-Climbs, Etc.

- July 31-Aug. 8...—Belgium Regularity Contest for Touring Cars, A. C. of Belgium.  
 Aug. 1-7.....—Criterium of France, 1,750 Miles Touring Competition and 250-mile Race for the Press Cup, A. C. of France.  
 Aug. 3.....—Isle of Wight, British International Cup, Motor Boat Race.  
 Aug. 23.....—Belgium, Ostend Motor Boat Meeting.  
 Aug. 11-29.....—France, Coupe de Auvergne.  
 Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.  
 Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.  
 Sept. 15.....—France, Chateau-Thierry Hill Climb.  
 Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.  
 Oct. 20.....—France, Gaillon Hill Climb.  
 Nov. 1-15.....—France, Voiturette Contest near Paris.  
 May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.  
 July 14, 1908....—Paris to London, Aerial Race.

AMBOISE, AN ARCHITECTURAL JEWEL OF FAIR TOURAINE.

SUNDAY, May the Seventh.—The vibration of four long, slow, musing strokes spread themselves over Amboise, still asleep in the imprecise white of dawn. Right at the foot of the *donjon* that shelters the old bell stands our blue Stearns, rested, watered, lubricated, hardly smoking, and roaring discreetly in the great silence. Clarence, my mechanic, his head under the bonnet, listens attentively to the rhythm of the pistons.

The motor of an automobile—and particularly that of a Yankee-made automobile—is (as a good many autoists of nowadays know, I presume) an enamored faun, who vowed to sing an eternal, monotonous banjo tune on one note, “raw-raw-raw-raw,” for the only love of eight slender, coquettish little valves dancing a perpetual and synchronous little jig, “tekatekatakac.” But what is the good of trying to explain those abstract things to Clarence? That fellow positively believes in nothing. On such a mysterious revelation I am sure he would spit his “Virginia leaf” on the running board and reply in a sort of a disgusted way, “Watchertawkin’ about?”

\* \* \*

In the wind, one hand on the wheel, Clarence buttons his covercoat up to the collar, for the air is really cold. Light gray vapors softly ascend from the brown fields and the green prairies. The road is wide, smooth, even, and we hear the fine gravel of the macadam creak under the tires. Over yonder, at the extreme limit of the horizon, a symphony of glorious reds announce the accession of the sun. We maintain a regular gait of thirty-five miles. I wish we could dine at Bordeaux by seven to-night and reach Mont-de-Marsan with the head lights.

\* \* \*

7:30 A.M., Chatellerault.—We just had breakfast here. Old farmers, scared dogs and a few astonished cows, in the little villages of Montbazou, Sorigny, Sainte Maure, La Celle St. Avant, Port de Pile, have seen “Miss Stearns No. 270” pass in a flash, followed by a cloud of dust, buzzing and impeccable, with

An impressionistic sketch from advance pages of M. Dupuy's book, “A 6,000 Mile Trip Around Europe in an American Made Car.”

her two enormous glassed eyes, and driven by a nonchalant little fellow smoking a briar pipe. They have seen Miss “No. 270” climb the hill and disappear in the perspective. Then the farmers have sighed and crossed the road, the dogs have barked, the cows have resumed their ruminating. I am writing these hasty notes while Clarence, swearing like a trooper (when in English, they don't mind so much in France), searches the whole car for a handful of waste. I know there is none, as I used the last last night to wipe the mud off my shoes.

\* \* \*

9:00 A.M.—Here is Poitiers. I can see the top of its four pointy steeples emerging from behind the long hill. We climb smoothly and keeping the same gait, with a little touch of the accelerator, and on high speed, of course.

“Saw that?” cries Clarence, placing his hand in front of his mouth to let me hear behind.

I turn quick to see the road. In the whirlwind of dust a good dozen white feathers are dancing a vague two-step.

The pavement in Poitiers must be three centuries old. The Louis XI. Cathedral is a piece of embroidery in itself. Here is the Placc d'Armes and the statue of “Le Roi Soleil.” “Now, what does that gendarme want?—What?—Clarence, please stop awhile.—What?—Our bridge ticket?—No, we did not take any ticket before crossing the bridge.—Why don't you put a sign there, or something, to let automobilists know they have to stop?—How much is it?—Three sous?—Here you are.—Don't mention it.”

\* \* \*

We are again on the wide, smooth road, bordered with high and pensive poplars, agitated by the morning breeze. Far away, on the gray ribbon, at the end of the perspective, a solitary little black point has just appeared. It is a man, a man with a pack on his back. It is a “chemineau,” I can see it the way he walks on the grassy side of the road. The “chemineau” is a typical wanderer, an honest tramp of France, who perpetually migrates from one town to another in order to improve his talents. The “chemineau” is usually a carpenter, a blacksmith, or a roof-maker. He is also a dreamer, loving the deserted road, the kilometer stones and the warm sun. “Clarence, old man, let's stop to pick up this fellow; he looks tired.” (Clarence always growls on such occasions, but what's the use of paying any attention to his feelings?)

Hello! Mon vieux, où allez vous?” (where are you going?)

“To Bordeaux, my brave friend, by way of Angoulême and Libourne, about 220 kilometers; yes, my brave friend. Sun is hot, my brave friend, but I hope I'll be there by Wednesday at noontime.”

He is a short old fellow, tanned and gray, and what he wears on his feet are anything but shoes. But that is very kind of him, just the same, to call me “his brave friend.”

“Get in quick! We will put you at Bordeaux to-night. Well, hurry up!”

“Do you really mean—?”

The poor man is crazy with surprise and joy. All trembling, he puts his load on the floor of the large tonneau and while the car, having resumed its gait, devours the road again, I help him to insert his arms into the sleeves of a long raincoat, which wraps him entirely. Then he sits on the soft cushions and smiles in the wind.

“Are you comfortable?”

“This is heaven, my brave friend; this is heaven.”

“Very well then.”

\* \* \*

The wide valley of the Charente river is even more charming than the paintings of Varennes. On the limitless green carpet live little hamlets, little streams, little hills, little cattle, and a narrow-gauged railroad invaded by all kinds of herbs and wild flowers runs alongside the highway.

"Yes, my brave friend, this is the happiest day of my life." (KONG-KONG-KONG, plays Clarence on the horn.) "Yes, indeed, and let me introduce myself. My name is Lagrave, Charles Lagrave, born at Pau in 1865, wood-sawer by trade, but since I had (KONG-KONG-KONG) an accident at my left leg (the chemineaus all have something at their legs, that is the reason why they perpetually tramp all over the country), a bad accident, my brave friend, getting down a staircase, I sprained my ankle, and (KONG-KONG-KONG) I am sometimes obliged to——"

"Get out of there, you crazy old witch!" That is Clarence singing this time. The old woman wakes up, utters an awful cry, and the donkey, in a sort of a funny little cake-walk, goes right to the ditch. That doesn't make any difference. The old woman, you have understood, was sound asleep in her cart in the very middle of the way.

\* \*

12:45, Ruffec.—That lunch was excellent. Charles Lagrave, my brave friend, always wrapped in the raincoat (because his clothes are so ragged) has enjoyed it too. But despite all his exquisite French politeness I do not think he will ever make friends with Clarence. Clarence looks at him as he would at a nigger. But what do we care, Charles and I?

\* \*

2:00 P.M.—Fifty-eight miles, with a good dozen long, steep hills, in one hour and thirty-five minutes. That is not bad. Charles is still smoking the cigar I offered him at Ruffec and he smokes some of his own moustache also. That man certainly does look funny with a pair of goggles and a skating cap!

\* \*

3:45 P.M.—Like happy nations, we have no history. Miss Stearns No. 270, roaring imperceptibly, swallows every hill, Clarence says nothing, Charles sleeps, I write these lines with a good-willing pencil, and the trees, the telegraph poles, the villages, the railroad crossings, the little cantonnier huts on each side of the road fly back in the wind.

\* \*

5:00 P.M.—Here is Libourne. We stop at the entrance of the town to "oil up." While Clarence opens his drop-oiler I get off to pump a soft tire at the rear. An old gentleman approaches, looks at the dusty machine, looks at the dirty workers at both

ends of it, and finally addresses Charles, who is gravely studying the map in his corner. The old gentleman must be the Notary Public or perhaps the School Master. He has the accent of Gascony.

"Bonjour, monsieur! That is a very powerful automobile, is it not?"

"Yes," says Charles.

"How many 'chevaux' (horse or horsepower), if you please?"

"Oh," replies Charles, anxious to put an end to the conversation, "don't you worry about the chevaux; we've got enough; yes, my brave friend, we've got enough, I tell you that!"

\* \*

8:20 P.M.—We have left Bordeaux more than an hour ago. We must not be far from Castel-Jaloux. I don't think it would be reasonable to try to make Mont-de-Marsan to-night. Three hundred and seven miles have been covered to-day up to this minute, as I can see by the speedometer.

We are in the great forest of the Landes, where Victor Hugo says he met the Devil and his companions. The sweet, fragrant odor of the pines surrounds us. The sun has sunk behind the mournful trees.

My brave friend Charles we left in Bordeaux at the corner of the Rue Ste. Catherine. Poor Charles!

Now the soft night comes down. A plucky little hare crosses the road once in awhile, and over there, at five hundred yards, shines the ancient lamp post of the Hotel de la Boule d'Argent, first house in Castel-Jaloux, on the right, when you come from Bordeaux.

"Good evening, Madame."

"Good evening, Messieurs."

"We are very, very hungry."

#### OLYMPIC GAMES TO INCLUDE MOTOR EVENTS.

LONDON, July 22.—Automobile events in connection with the international Olympic games to be held in London next year will consist of three races on the Brooklands track at Weybridge, the course at the Stadium not being suited for motor racing. The events will be a flying kilometer for racing machines; a 9-mile race for touring cars of not more than 30 horsepower and carrying 280 pounds weight in addition to the driver and mechanic; a 14-mile race for racing machines not exceeding 2,600 pounds in weight, including driver and mechanic. These events, as well as a motor boat race on Southampton water, will be held in July.

ACROSS THE LEVEL STRETCHES OF THE LANDES, WE REVELED IN FRANCE'S MAGNIFICENT HIGHWAYS.

STATE HIGHWAY AT SPENCER, MASS., PAVED WITH HASSAM CONCRETE.

### THAT DUSTLESS ROAD IN OLD BAY STATE.

WORCESTER, MASS., July 29.—One section of the main through route for automobiles between New York and Boston, over which motor travel is now rushing, gives up no dust for the wayfarer, no matter what the condition of the rest of the highways, even in Massachusetts, the home of the State highway. This is in the town of Spencer, just west of the center of the town, and reached by the east-bound autoist after passing East Brookfield, thirty-six miles east of Springfield. It was built under orders issued by the Massachusetts State Highway Commissioners in 1906.

The paving is known as the Hassam paving, for the inventor of this method of laying concrete paving is Walter E. Hassam, former street commissioner of Worcester and now general manager of the Hassam Paving Company. He has laid many thousand yards of paving in the past year all over the country. One of the showpoints for his paving is at Phoebus, Va., where the Jamestown Exposition visitors can see it. Another section is being laid at Niagara Falls, N. Y., and he will have it in Boston, New York and many other large cities before the season is over.

The surface is smooth, but there is sufficient grittiness to the top of the highway to prevent slipping or skidding, and one of the fastest miles on the New York-Boston run is invariably done on this section of State highway at Spencer.

In the illustration Vice-president Daniel F. Gay of the Worcester Automobile Club is shown traveling at a rate of forty miles an hour on a very dusty day—at least it was dusty on other places found that afternoon.

The concrete roadway stood the weather of last winter in good shape and looks to be good for a long time without perceptible wear.

This section of highway was looked over carefully, together with another section of the same highway built by the Hassam Company at Williamstown, Mass., by A. R. Pardington when he was looking up data for the Long Island parkway.

### MAKING A DUSTLESS STREET.

BOSTON, July 29.—Commonwealth avenue in Boston is one of the splendid boulevards of the famous Back Bay district, a broad, handsome street, parked through the center and

lined with fine residences, forming the main pleasure thoroughfare out of the city to Brookline and the Newtons. For many years it has been a favorite thoroughfare for automobiles.

As it was intended only for light vehicle traffic, and not for business uses, the avenue was macadamized and the result since the advent of the automobile has been a vexatious road problem, which led many of the residents to think that asphalt or wood pavement could not be avoided. The Metropolitan Park Commission and the city of Newton, however, have solved the problem satisfactorily without going to much expense, and the Back Bay residents will still have their quiet, easy riding, macadam pavement without the constant rebuilding and the dust.

The road was first carefully swept, to remove surplus dirt and loose particles, and the tarvia was then applied hot through a hose and rubbed into the road with street-sweepers' brooms. After it had permeated the road and cooled for a period of about five hours, a light coat of screenings was spread and a steam

roller completed the treatment, leaving a smooth, compact surface.

One of the peculiar features of macadam treated this way has been noticeable after a few months, namely, that up to a certain point a tarviated road improves, instead of deteriorating, with use. Uneven spots wear smooth instead of tearing loose or raveling, and high spots in the road wear down to their proper level.

Following the melting of the snow after its first winter, the tarviated part of Commonwealth avenue (opposite the Hotel Vendome) was found to be the only section in Boston which did not need to be resurfaced, while in Newton the road in front of the Brae Burn Club was as smooth as a billiard table. The adjacent roads will require a large expenditure to put them in good condition for the season.

The process is a development of French road practice. In France for a number of years certain grades of tar have been very generally used for highway improvement, and the French road engineers, who are undoubtedly the best in the world, have developed the method of application and have even invented elaborate machinery for applying their tar treatment. In this country about a million yards of roadways have been treated with this material for the prevention of dust with great success.

SPREADING TARVIA ON COMMONWEALTH AVENUE, BOSTON.

**Some Mechanical Lessons from the A. A. A. Tour.**

Doubtless the fact that by far the most common form of mechanical trouble encountered by the competitors in the recent A. A. A. tour for the Glidden and Hower trophies had to do with the axles and suspension of the cars, will be seized upon for criticism and the American car put down as weak in these very important respects. Had the route of the tour been over the park-like roads of France or England, or even over such going as was selected for the recent A. C. A. sealed bonnet contest, for instance, there would be considerable foundation of truth in the charge, but no one who participated in the 1,600-mile struggle, whether technically trained or otherwise, could justly accuse such cars as went down before the onslaught as being weak in this, or, in fact, in other respects. True, not a few of them came through wholly unscathed. The more credit to them. It only goes to show that while American cars as a whole are remarkably trustworthy and enduring there are still some that are better than others, and doubtless there always will be.

There might be some justice in the charge also had the failures of the parts in question been wholly due to the wear and tear occasioned by legitimate touring service. To put it mildly, there was compressed into the fortnight of the tour the ample equivalent of more than a season of the hardest kind of touring, for no private owner would voluntarily subject his machine to such gruelling as the drivers in the tour found themselves compelled to in order to attempt to fulfill its arduous conditions. And to make the charge totally baseless there is the fact that almost

without exception these failures were the result of accidents pure and simple. There is little to be wondered at in the breaking of springs or axles when a car is hurtled into a ditch at high speed—rather the marvel is that those which met this fate, and they were not a few, did not suffer more grievous damage. Without doubt the most striking mechanical lesson of the tour brought out is the wonderfully high factor of engine reliability displayed by such a number of cars under the worst possible conditions. The percentage of trouble traceable solely to the motor or its accessories was practically a negligible quantity. There is still room for improvement in the automobile, whether American or otherwise, but the lesson of the tour is not half so much that a better car is needed as that better roads are a crying necessity.

**What is to Be Looked for in the 1908 American Car.** Experience in the past few years has demonstrated that the American automobile industry, as a whole, has entered upon a distinctive period in its career so far as the present and future character of its product is concerned. Up to 1904, or probably as late as 1905, it was customary to regard the coming of each year as an opportunity to give full sway to the designer's theorizing by bringing forth something that should be as different as possible from the model that had preceded it. The result naturally was that cars of the same make but of different years' models bore no resemblance to one another, either in outside appearance or constructional features. The work of the year was literally "dumped overboard" and a fresh start made at the last moment—the new model frequently not being out of the shop in time to reach the annual show at its opening.

There are doubtless those who think that similar conditions still prevail to a greater or less extent in the industry to-day, but nothing could be further from the reality. It may be a disputed point whether 1904 or 1905 really saw the passing of this pernicious state of unsettledness, but that it did finally pass for good about that time there can be no possible question. All of which means there will be no *new* cars for 1908, in the sense in which the word was construed up to the years in question. There will be new models galore—each maker will have one or several—but they will one and all embody what experience has taught their makers is sound from an engineering point of view, together with what detailed refinement that same experience has shown can be added to make the car a closer approach to that goal of perfection in simplicity and reliability for which all are striving.

**Good Results Certain from Uniform Race Rules.**

When the delegates of all the national automobile clubs of Europe united at Ostend and unanimously decided upon a mechanical formula to govern future speed tests, they laid the way for an important development of the industry. Despite the hoarse ravings of a certain section of the public and a very small number of those within the fold against the continuance of racing, European constructors are convinced that speed, and speed alone, can improve the breed of automobiles. By speed is of course meant the holding of serious tests, with every possible guarantee for participants and public, and not the wild scamperings of irresponsible individuals after self-controlled records. Under the new conditions fixing cylinder bore at 6.1 inches and weight limit at 2,425 pounds, constructors need build only one set of racing machines with which they may figure in at least half a dozen international events. Compared with this year's system, calling for at least three different types of cars, the economy from a manufacturing point of view is enormous.

An interesting question raised by the new racing rules is will next year's machines, with their bore reduced one inch, be able to maintain this year's record? Constructors themselves are divided; but it is safe to predict that the diminution, if any, will not be in proportion to the reduction of cylinder area, and that the whole range of automobiles will profit by the year's experiments.

## NO VANDERBILT CUP RACE TO BE HELD THIS YEAR

THERE will be no Vanderbilt Cup race this year. This decision and the reasons for it are announced in the following notice, issued on Saturday last from the A. A. A. headquarters, 437 Fifth avenue, New York City:

There will be no contest for the William K. Vanderbilt Jr. Cup during the year 1907, at least, in the United States. This announcement, reluctantly made by the Commission, follows an attempt to promote the race covering several months. The unfavorable attitude of the Governor of the State of New York with regard to the proposed use of the militia to guard the course; the failure of the New Jersey State Senate to convene in special session owing to deadlock; the great distance which the foreigners would be obliged to travel in the event of accepting the very cordial invitation of the Governor of California, and the lack of assurance from Missouri, due to the absence of Governor Folk from the State, that the guard of the State could be used, makes necessary the announcement.

The donor of the cup, William K. Vanderbilt, Jr., and the Chairman of the Commission, Jefferson DeMont Thompson, have been in correspondence with the acting chairman by cable, and it has been deemed wise, in view of the delays and the foregoing conditions, to defer the holding of the race in this country this year.

(Signed)

A. R. PARDINGTON, Acting Chairman,  
F. H. ELLIOTT, Secretary,  
William K. Vanderbilt, Jr., Cup Commission.

New York, July 27, 1907.

While the giving up of the race for this year is a great disappointment to the manufacturers of high speed cars, the members of the Vanderbilt Cup Commission, including the donor of the cup, did not care to go ahead with a race which would have to be run under the perilous conditions which reached a culminating point in the running of the 1906 event on Long Island. Unable to secure militia to guard the course, none of the active members of the commission cared to undergo again the strain to which they have been subjected for the past three years. The policing of the 1904 course was less difficult because of the comparatively small attendance, though Chairman Pardington and Cup Donor Vanderbilt experienced great relief when the day

ended without any accident. At the conclusion of the 1905 race, Chairman Morrell expressed the opinion that there would never be another cup race on Long Island. The 1906 A. A. A. Racing Board voted to hold another event, but when it concluded with one fatality and another serious accident, a quick decision was reached that unless the 1907 race could be held on the Long Island Motor Parkway, or with militia to guard the road, if the parkway were not completed in time, its running would have to be given up. Chairman Thompson, Acting Chairman Pardington, President Hotchkiss, and other A. A. A. officials have used their utmost endeavors to secure a militia guarded course, but their efforts have been futile, and those inclined at all to be fair-minded recognize the conscientious efforts which have been made to comply with the desires of the manufacturers.

Though it has been suggested by two automobile editors of New York dailies that the A. C. A. should now hold an open road race of an international character, it is a certainty that nothing of the kind will be attempted, the club's officers still having in mind the unfortunate Staten Island experience of several years ago.

Despite statements printed to the contrary, the American makers have not gone to any great expense in preparation for a cup race. One firm has reconstructed its 1906 cup cars and now will utilize them in other ways. Another firm intended to use its 1906 car almost as it stands; a third company had in mind the using of its stock chassis with racing body; and others had made but slight progress in the construction of speed cars.

It is among the probabilities that there may be held in Florida next winter a long-distance event for racing cars and also a somewhat similar race of a stock car chassis character. Since the announcement that the Vanderbilt Cup race would not be held, there has been a consequent revival in talk of Florida and its winter program. It is known that the Florida East Coast Automobile Association has asked the A. A. A. Racing Board to take charge of the meet.

## HOW ONE NEW JERSEY AUTOIST REGARDS ROAD RACING

Editor THE AUTOMOBILE:

In your issue of July 25 appears an editorial entitled "New Jersey Repudiates the Vanderbilt Race." In holding us up to ridicule because we do not see fit to allow the race I feel that you do us an injustice, and the tone of the article, in which you call us "foreigners," and accuse us of mediæval ideas, is undignified and petulant.

As a matter both of public policy and of the true interests of the automobile it is unwise for any State to grant the use of its roads for a race. Its greatest harm is the fostering of a mania for speed which is the cause of most of the prejudice against us and of most of the restrictive laws from which we suffer.

In the community in which I live we have over a dozen automobilists. All of us use the roads with care and with due consideration for the rights of others, and by so doing have almost entirely overcome the prejudice here against the automobile. Every once in a while, however, some reckless driver of a high-powered machine rushes through our midst, tearing up our good roads and scatters them in the form of dust over our farms and lawns, driving horses into the ditches, and frightening women and children; and im-

mediately we hear the cry that we should be placed under more severe restrictions.

The consequences of this reckless craze for speed are sometimes frightful. Witness the accident recently down near Barnegat, in which a car running at racing speed crashed into a family touring party, killing one and dangerously injuring several others. An occurrence of this sort is a brutal outrage which words are not strong enough to condemn. It is a direct consequence of the racing spirit, and its perpetrators should be punished by imprisonment for manslaughter.

Every one who feels enthusiastic over the present development of the automobile, and who looks forward to its future usefulness to all classes of society for business and for healthful recreation, should do all in his power to discourage racing, and I believe the policy of your otherwise excellent paper in favoring it is suicidal.

In refusing to permit the Vanderbilt Cup race to be held here our State is upholding the right of all users of the roads, in furthering the true interests of the automobile, and is giving a splendid example of our far-famed "Jersey justice."

Moorestown, N. J.

JOSEPH STOKES.

### PANHARD BOAT WINS PARIS-TO-SEA RACE.

TROUVILLE, FRANCE, July 25.—The *Panhard Tellier*, victorious all along the line at Monaco, has proved herself the victor in the Paris-to-the-Sea race, just concluded here. Her time is two minutes faster than the previous record. *La Rapière II*, also with Panhard engines, came second, followed by the *Mercedes*. In the cruiser class *La Lorraine* was first, with *New Treffe* (Brasier engine) second, and *Nautilus Mutel* (Mutel motor) third. The race, which was a seven-day event, united twenty-five competitors, twenty of which were present at the finish.

### CAN THE GRAND PRIX RECORD BE BROKEN?

PARIS, July 23.—A bet of more than local interest has been made between Louis Renault and Rene de Knyff, director of the Panhard firm, on the possible speed of next year's racers. With cylinder bore reduced to 155 millimeters one party maintains that speed will be reduced, the other claims that the Dieppe record will be maintained. This year, Fiat, Darracq and Dietrich had 180 mm. bore, Renault and Brasier, 165. To maintain the Grand Prix record will therefore require a considerable increase of efficiency in the engine and transmission.

### AUTOMOBILE RACING IN THE NORTHWEST.

WINNIPEG, MAN., July 26.—With the exception of what might have proved a bad accident to Bruno Seibel, better known as the "Flying Dutchman," in the handicap race, the meet held under the auspices of the Winnipeg Automobile Club on Saturday last was a great success. Fully 7,000 people turned out to see the races, and the whole affair was run off without a hitch, due to the excellent management of the promoters. The program of eight events was well varied, and provided constant interest for the spectators. It led off with a two-mile event for Ford runabouts, which was won by F. Lion, driving for J. Maw & Company, in 3:56. This was followed by an event at the same distance for fully equipped touring cars, in which a Stevens-Duryea 20, a six-cylinder Ford and two Oldsmobiles, one of them a roadster, lined up for the start. W. Fisher, driving the roadster, came in first in 3:52, with L. Grussey, in the Stevens-Duryea, tagging on to his rear wheel, a close second.

The track is a half-mile oval with a cinder surface, and this seemed to worry Seibel, who was down for a two-mile exhibition in the Peerless *Red Devil*, so that the best he could do was 2:56. The next number on the program was a purely amateur event, dubbed a novelty race at three miles, making the first lap empty, then pick up three passengers, discharging them again at the end of the second lap, re-embarking them at the third and again losing them at the fourth, making the last two laps empty. The passengers were the most enthusiastic competitors of the lot, and in their haste to get off and not delay the car in which they were riding they usually started long before it came to a stop, with the result that the track was covered with involuntary acrobats for some time. D. E. Gourlay in a four-cylinder Oldsmobile was an easy winner, followed by Dan Woods in a second car of the same make. Time 6:18 1-2. Then Oldfield did a two-mile exhibition stunt in 2:38, which was 10-5 seconds better than existing Canadian track records. This was followed by a three-mile handicap event, on the fourth lap of which Seibel went through the fence on one of the turns, Fisher in the Olds roadster only saving himself from a collision by some quick and cool work with the wheel, which also saved him the race, the six-cylinder Ford, driven by McGregor, taking second. Time 5:28 1-2.

A 25-mile match race for \$100 a side between a Ford and a Maxwell runabout closed the program, and proved one of the most exciting events of the day, as the issue was in doubt right to the last. F. Lion, driving the Ford, finally won by almost a lap in 48:12 4-5, his competitor being L. Grussey, who drove for the Dominion Automobile Company.

### ATLANTIC CITY'S AUTOMOBILE CARNIVAL.

ATLANTIC CITY, N. J., July 30.—This up-to-date city by the sea will be turned over to the automobilists next week, and if preparations count for anything there will be a busy innings for all kinds of autoists. The speed contingent will open the carnival with two days of racing on Ventnor Beach, and the entry list will contain such good ones as Thomas, Darracq, Locomobile, De Dietrich, and Matheson, Vanderbilt Cup racers, Christie and his "Blue Streak," and several other of the fast brigade. The racing part of the carnival is in charge of the Atlantic City Automobile Club, with Harry Cook, chairman of its racing committee, the man at the helm, which means that there will be nothing lacking in the way of arrangements. The motorcyclists will have races for their kind.

The floral parade will take place Wednesday and cups innumerable are offered for the best decorated cars. Pacific avenue, seven miles long, will be the route of the parade, with the reviewing stand at City Park, between the Marlborough-Blenheim and Brighton hotels.

Concluding the week will be the three-day exhibit of cars on Young's "million dollar pier," which will supply an ideal location for this feature of the carnival. C. Wood Tatham is the president of the well-planned auto week.

### HARRISBURG COMPETITORS TAKE HONORS.

READING, PA., July 29.—It was Harrisburg day Friday on the Fair Ground track at the meet held under the auspices of the Reading Automobile Racing Association, as entrants from the latter city walked off with practically all the prizes. The meet opened with a big parade and carnival in the morning and despite threatening weather and a light sprinkle that looked as if it might turn into a downpour, between two and three thousand people filled the grandstand and overflowed into the bleachers.

The first event on the program was an obstacle race of the now familiar type, in which John E. Sellers, driving a Maxwell, took the prize in 45 seconds by a masterly exhibition of driving, not another one of the competitors succeeding in getting by all the dummies without knocking them over. This was followed by a motorcycle race in two heats, both of which, as well as the final, went to local riders. There was not much excitement provided until the fourth event, which was a two-mile dash for stock gasoline touring cars, the first heat of which was won by a Jackson driven by Chester B. Smith. The final was between the latter and a Ford, Smith bringing the Jackson in first by a liberal margin in 3:11½, the next to the fastest time of the day.

In event No. 5, a stripped Pullman with Robert Martin at the wheel, was victorious over an Acme handled by Edward Lengel. In the second heat the Pullman was steered by J. A. Kline, while his competitor was J. Seager in a Wayne. The race proved close and exciting until the Wayne had motor trouble and had to quit, so that there was no final, to make up for which Kline drove an exhibition mile in 1:33½. These races were followed by what some wag in the crowd dubbed "gin rickey" stunts (gymkhana), much to the amusement of the spectators, and they were in turn followed by the other speed numbers on the program, event No. 7 for gasoline runabouts being captured by Pullmans in both heats. The meet closed with the contest for the Reading *Eagle* silver cup, which was taken by an Acme, but because of a protest no winner was announced. Challenge races will be held August 10, the outcome of several challenges made at the meet.

### HILL-CLIMB UNDER NOVEL CONDITIONS.

Not the least interesting feature connected with the annual hill-climb to be held by the Chicago Motor Club, at Algonquin, Ill., on August 9, is the method of classifying the competing cars according to their piston area, as adopted by the English club recently. The event is, moreover, in the nature of a twin trial, as the morning session will be devoted to tests made from a standing start, while in the afternoon all attempts at records will be from a flying start. Six classes are provided for; one a free-for-all in the full sense of that term, the others being divided as follows: Class 1, cars with a piston area under 35 square inches; class 2, 35 to 50 square inches; class 3, 50 to 65; class 4, 65 to 90; class 5, over 90 square inches.

The formula upon which the rating is based consists of squaring the bore of one of the cylinders and multiplying by the number of the latter. The adoption of this classification brings about some odd groupings in the cars to line up for the various trials, and it is thought that when the definite results are made known it will be found that this is a thorough test of their ability in hill-climbing. The handicapping system is the same as that used last year, the cylinder dimensions being multiplied by the combined times up the two hills and divided by the weight of the car with driver. The standing-start trial is to be up a quarter-mile incline, said to be the highest hill in the State, while the flying-start trials will be on a half-mile grade situated on the other side of the town of Algonquin. Last year's record holder is a Pierce-Arrow, which made the distance in :34 flat from a standing start, while in the flying start trials the Pierce and the Stevens-Duryea Six were tried at :46 2-5. The Autocar, Jackson, Queen and Pierce were the class winners. Entries for the event close with Charles P. Root, 1200 Michigan avenue, Chicago, on August 5. The fee is \$30, half of which is refunded at start.

## GENERAL CLUB NEWS FROM FAR AND NEAR

### Enforcement of the Pennsylvania Automobile Law.

PHILADELPHIA, July 29.—S. Boyer Davis, of counsel to the Automobile Club of Philadelphia, and who is also the secretary of the club, has sent out a general letter to the members of that organization regarding the recent epidemic of trapping that has sprung up near the Quaker City and in eastern Pennsylvania generally. His opinion of the spirit in which the law is enforced will doubtless come as a surprise to many. "In the course of my duties I have met many of the local officers and have had opportunity to observe their work and methods of enforcing the automobile law. The majority I have found to be fair and liberal, and in most cases the officers reporting violations were paid by the day and do not benefit by making such reports." While rank injustices are frequently perpetrated in making arrests, there is little doubt that thoughtless, if not deliberate, violation of the law is more or less common, and this Mr. Davis says he has found to be the case, cautioning the members of the club to pay particular attention to compliance with the legal requirements, as otherwise the danger of stringent and restrictive legislation is imminent.

### Outing of the New Jersey Automobile and Motor Club.

NEWARK, N. J., July 29.—The next outing of the New Jersey Automobile and Motor Club may be to Olympic Park, August 17, if arrangements can be made in time. Chairman Joseph H. Wood, of the house committee, and Secretary Horace A. Bonnell recently visited Olympic Park to see what the outlook was for holding an event at that place. Some sort of a carnival, slow race on the high gear and other novelty events, a dinner at the Park restaurant, and the opera in the evening may be included in the program. A club run to some coast resort with an old-fashioned shore dinner is a possibility of the near future.

### Lancasterians Will Inspect the County Turnpikes.

LANCASTER, PA., July 29.—At a meeting of the board of directors of the Lancaster Automobile Club last Friday evening a letter was read from ex-Attorney-General W. U. Hensel, the club's legal adviser, in reference to the appointment of committees and the work that the club can do. As a result, a committee of inspection will go over all the turnpikes in the county to learn whether the companies are living up to their charter. One man will have a turnpike to inspect and he will go over it and note any breakers or other defects in the pike. The club will then take action against them.

### Buffalo Club to Assist Old Home Week Auto Event.

BUFFALO, N. Y., July 29.—Buffalo is to have an Old Home Week in September. One of the features of the week will be a magnificent automobile pageant at night. Every automobilist of the city has been asked to cooperate in making this parade a spectacle long to be remembered by the people. Each car will be expected to be lavishly decorated. Prizes are to be offered. Seymour P. White, president of the Automobile Club, is chairman of the committee that is to arrange the details of the parade. H. A. Meldrum, a director of the club, is assisting him.

### Philadelphia Now Has a Ford Motor Club.

PHILADELPHIA, July 29.—Regular organization of the Ford Motor Club of this city has been perfected with the election of Dr. I. E. Bennett as vice-president and R. F. Kohler as secretary and treasurer. The next regular run is scheduled for August 4 to Three Tuns. It is expected thirty cars, ten of which will be driven by ladies, will participate.

### Hartford Autoists Arrange Hill Climb and Gymkhana.

HARTFORD, CONN., July 29.—A hill climb on Albany and Prospect avenues on September 7, and a program of gymkhana sports at Charter Oak Park, September 14, will keep interest at a fever heat in the Connecticut Valley during the next six weeks. At a special meeting the Automobile Club of Hartford decided to arrange these events, and for the gymkhana sports has arranged a program of rare attractiveness, teeming with novel features, which will include a parasol race, lamp race, button race, hat race, Teddy Bear race, turning race, and best appearance contest, all to be open to both lady and gentleman drivers. In addition to the above the following track races will be held on the Charter Oak course: Five miles, for cars costing less than \$1,500, amateurs to drive (manufacturers and agents barred); five miles, for cars costing \$1,500 and less than \$3,000, for amateurs, owners to drive; five miles, for cars costing \$3,000 or over, for amateurs, owners to drive.

### Ohio Valley Auto Club Hands Out Prizes.

WHEELING, W. VA., July 29.—At a meeting held here last week the Ohio Valley Automobile Club awarded a number of trophies to those of its members who have signally distinguished themselves during the past year. The prizes consisted of five handsome loving cups in silver, suitably engraved, which were handed to A. W. Paull, Earl M. Giesy, Charles F. Paxton and two others which will be awarded later, as the members were not present owing to the inclement weather. The club will soon hold a dinner at Colerain, O.

### Automobile Club Organized at Winona, Minn.

WINONA, MINN., July 27.—Automobile owners of this city have organized the Automobile Club of Winona, and will have headquarters at the rooms of the Arlington Club for the present. Officers elected for the first year are as follows: President, E. W. Williams; vice-president, H. S. Youmans; secretary and treasurer, Theodore Wold; board of directors, the above-named officers and S. H. Somsen and J. W. S. Gallagher.

### CLUB DOINGS IN GENERAL.

MASON CITY, IA.—The first run of the Mason City Automobile Club was held July 22, the trip being to Nora Springs. The club is a new organization and promises to make itself a power in this section of the State.

SAN FRANCISCO.—Fifty women participated in the recent run of the California Women's Automobile Club of this city, to Del Monte early this month. It was the longest and most successful tour ever held by the organization.

WILKES-BARRE, PA.—Direct purchase has been made by the Wilkes-Barre Automobile Club of the mountain boulevard from Albert Lewis, the man who built and owned it. This private road was the easiest route from the valley and has hitherto been closed to autoists, who have been unable to secure permission to use it. The club did the next best thing under the circumstances—purchased it outright.

ROCHESTER, N. Y.—The work of posting the roads in and about Rochester with signboards is well under way, under the direction of the Rochester Automobile Club. Secretary Bert Van Tuyle is making daily trips over the territory, has completed the Scottsville road to Batavia, and has started work on the Churchville road. When this is completed the Geneva and Ridge road will receive his attention.

### CONCERNING GEORGIA'S NEW LAW.

ATLANTA, GA., July 29.—Georgia Senators have just applied the brakes to automobiles in passing a bill by Senator Felder, of Macon. The bill fixes the speed limit at fifteen miles an hour and throu other restrictions around the operation of machines. Here are the provisions of the bill briefly stated:

Forbids driving autos in built-up portions of incorporated towns, where houses average less than 150 feet apart, at greater speed than one mile in six minutes.

Forbids greater speed on country highways than one mile in four minutes.

Provides that automobiles cannot be run on any street or highway at greater speed than proper for preservation and safety of public. Act does not in any way affect right of person to sue and recover damages from auto owner.

Lays stringent regulations on auto drivers in regard to persons riding or driving domestic animals.

At a signal from a person riding or driving restive domestic animals, autoists must come to a full stop and remain so until danger is over.

All automobiles must have adequate brakes, good horn or bell, and carry, from one hour after sunset to one hour before sunrise, a white light in front of the car and red light in the rear. The headlight must project light 500 feet ahead of the car.

Act includes automobiles, locomobiles, and all other vehicles propelled otherwise than by muscular power, save electric and steam cars. Violations of act render offenders amenable to section 1039, criminal code.

Act does not affect or abridge right of municipalities to regulate auto driving within limits as they may see proper.

Automobilists are not displaying unusual interest in the bill. They understand that the bill contains a provision that it shall not conflict with the speed laws of any incorporated city or town, and, therefore, will not alter the status as regards speed in Atlanta and other large cities, where most of the automobiles are to be found. They seem to feel that the speed of fifteen miles in the country, provided for in the bill, is all right.

They do have a complaint that the bill is unfair in that it puts the burden on the automobilist to show that he was right in the case of an accident. They say this presupposes that the automobilist is guilty, and he is required to prove his innocence whenever any trouble occurs. Automobile legislation, however, which is new in Georgia, they think will gradually work itself right as the people at large become better acquainted with the subject.

### INDIANA HAS GOOD ROADS FEVER.

INDIANAPOLIS, IND., July 30—The crusade for good roads in Indiana, backed not only by automobile men, but by farmers, has reached such large proportions that a number of counties find themselves on the verge of bankruptcy due to extensive road improvements.

At the last session of the Legislature a law was passed making it mandatory for County Commissioners to grant a road of less than three miles in length, connected at each end with an improved free gravel or macadamized road, and providing it is traveled by a rural mail route, upon the petition of fifty persons.

In Randolph County roads that will cost upward of \$465,000 have been granted and are under course of construction. There are fifty-four petitions in Putnam County, calling for as many roads. Two of them have been built and paid for. Stone is easily obtained in the county, and fifty are to be built of stone and four of gravel.

There have been forty-five petitions granted in Howard County, and fifteen more are pending. Several others will be petitioned for later. Hamilton County will spend at least \$500,000 for roads within the next year, as thirty-six petitions have been granted within three weeks. Adams Township alone is asking for roads that will cost \$40,000.

Financial insolvency is threatening Clinton County because of the new law, and it has been discovered that residents of various townships are signing each other's petitions for roads. There will be sixty-three new roads built this year, according to petitions on file, although the number may yet reach 100. The average cost of building the roads is \$2,300 a mile. This is a very low figure

that is only made possible by the fact that there is an abundance of suitable material right at hand and as yet no difficulty has been experienced in obtaining a sufficient amount of labor at prevailing prices to carry the work of road improvement through—conditions that are not to be found in many other States where stone and gravel are scarce and have to be transported from a distance at a cost which more than doubles the expense of road building.

There are now 148 miles of improved roads in Morgan County, and about sixteen petitions are on file. In Shelby County a road was petitioned for, but the Commissioners were surprised a few days later to receive a remonstrance signed by the same persons presenting the petition.

About fifteen petitions are on file in Madison County. Monroe County will build six new roads, while Wells County Commissioners have sixty-three petitions before them.

The new law provides for a bond issue of 4 per cent. All the land-owners of a county are taxed alike for the improvements.

### ROAD SIGNS FROM THE N. Y. STATE PRISON.

As a part of its industrial activity, the Prison Department of the State of New York has taken up the making of road signs, the work being carried on at Dannemora, N. Y., where the Clinton prison is located. The aim has been to produce a sign-board that would be proof against the weather at all seasons of the year, and to this end the boards themselves are made of seasoned one-inch white pine, well protected with paint, the letters being painted on in black on a white background and are legible at a distance of 40 to 50 feet, depending on the size of the sign. The painting is thoroughly weatherproof and the signs will last indefinitely. The boards are mounted on wrought-iron standards, heavily coated with white lead as a rust preventative, and to which they are attached by bolts and nuts. They are made in a variety of styles and sizes, such as those

A SAMPLE ROAD SIGN.

shown by the accompanying illustration, depending on the nature of their location, and are sold at nominal prices. The sign shown by the cut is the largest size made and provides 12 different distances, the two parts being at right angles to another, this being variable according to the angle of the crossroads.

### TEXANS IN A QUANDARY OVER REGISTRATION.

FORT WORTH, TEX., July 27.—When the new Texas law went into effect on the 12th inst., half of the autoists in this city appeared at the Courthouse prepared to pay their 50 cents for registration, but here, as at other places, the county clerks have not yet received copies of the law. Consequently automobilists in this State are all violating the law, because they are unable to comply with it.

E. E. Fosdick, a prominent autoist of this city, has petitioned the commissioners to place a tax of \$1 a year on all automobiles and 50 cents a year on all rubber-tired vehicles for the purpose of raising a fund to improve the streets. According to his estimates, the owners of such vehicles expend \$50,000 annually for repairs and replacements due to the bad condition of the streets, tires in several instances having been completely cut in two by bottles, while injuries of an almost equally serious nature have become so very common that the expense of tire maintenance—already very high—has become more burdensome than usual.

## INTERPRETING CONNECTICUT'S NO SPEED LIMIT LAW

HARTFORD, CONN., July 29.—Instead of being downcast by the taking effect of the new automobile legislation removing the arbitrary speed limit, the rampant advocates of repression are hailing it as a greater opportunity for making large hauls than ever existed under the old law. It seems to be the impression now that they can take up any and every one they see by simply preferring a charge of reckless driving against them. According to Walter S. Schutz, attorney for the Automobile Club of Hartford, the only real change in the speed provision from that in the former law is the insertion of the word "recklessly," and a rate of speed in excess of 25 miles an hour is made *prima facie* evidence that the person operating the vehicle is doing so at a rate of speed greater than is reasonable and proper, and in violation of the provisions of the law.

Section 10 of the old law was to the effect that "no person shall operate a vehicle at a rate of speed greater than is reasonable and proper, having regard to the width, traffic and use of the highway, or so as to endanger property, or the life or limb of any person," and then followed the arbitrary provision that in no event shall the speed exceed 12 miles an hour within city

or borough limits or 20 miles an hour without such limits.

If a person is caught driving a car at a rate exceeding 25 miles an hour, the burden is upon him of showing that he was not operating recklessly, or without regard to the width, traffic and use of the highway.

"Of course, it is possible that traps will be maintained under the new law," says Mr. Schutz, "and that people will be convicted on the arbitrary statement of witnesses that they were operating 'recklessly,' but appeals to the Superior Court in a few such cases will put an effective *quies* upon such proceedings. Furthermore, as all fines must be remitted by the local justices to the State for highway purposes, I am confident that much of the local enthusiasm for traps will be dispelled. Both the Massachusetts and Vermont laws make driving at 20 and 25 miles an hour, respectively, *prima facie* evidence of improper driving. The new law in Vermont is working exceedingly well. I have just returned from a three days' trip in that State and hear nothing but praise for it. I am confident that the Connecticut law is likewise a tremendous advance over the old forms of automobile legislation, which provided an arbitrary speed limit."

## MASSACHUSETTS AUTOISTS AGAINST RE-REGISTRATION

WORCESTER, MASS., July 29.—The Worcester Automobile Club took the initiative among the clubs of the Massachusetts State Automobile Association in protesting against the new re-registration law of Massachusetts at a special meeting of the active members of the club Thursday night. After listening to talks by members and by Attorney Francis Hurtubis, Jr., counsel for the State Association, these resolutions were passed:

That the club members be advised in paying re-registration fee of \$5 to do so under protest, and that the club attorney furnish a form of protest to the assistant secretary, to be transmitted by him to the members.

That it is the sense of Worcester Automobile Club that the Massachusetts State Automobile Association should test and bear the expense of testing the constitutionality of Chapter 580, of the legislative acts of 1907.

In consequence of the first vote, Vice-President Daniel F. Gay, counsel for the club, furnished Assistant Secretary R. M. Pratt with a form reading: "This payment is made under protest and by paying it I waive no rights," and this has been used by many of the members when applying for re-registration of

their cars. Because of the second vote, the State Association and the legislative committee thereof have been notified of the club action by President John P. Coghlin, and all of the clubs in the State have been likewise informed by the assistant secretary.

The action of the club is being endorsed by many non-members of the club, who have written it testifying to their endorsement and expressing their satisfaction that the club is taking the matter up. The Brockton, Mass., club will have a meeting to take action on similar lines.

At the meeting Thursday night it was stated by members who had consulted counsel on the matter that they are satisfied the annual fee of \$5 for registration of cars is clearly unconstitutional, and there will be a test case taken to the United States Supreme Court if the wishes of several of the leading members of the club are carried out. Most of the members of the club are applying for their re-registration and are paying their \$5 fee, which is due August 1, under protest, with hopes that the law will be declared unconstitutional and the fees returned.

## BUFFALO'S AUTO TAX DECLARED UNCONSTITUTIONAL

BUFFALO, N. Y., July 29.—Members of the Automobile Club of Buffalo are in a pleasant frame of mind over the decision of Judge Hodson of the Municipal Court, who, on last Saturday afternoon, declared the local ordinance requiring automobilists to pay an annual tax of \$5 was unconstitutional. The ruling was given in the test suit brought by the city of Buffalo against Dai H. Lewis, secretary of the club. At the behest of Secretary Lewis the club members declined to pay their tax some time ago and the city took steps to enforce its ordinance by virtue of a court ruling. It has lost.

Judge Hodson, in his opinion, says: "The charter amendment, in providing for the imposition of a tax and penalty upon an owner of an automobile 'for the privilege of operating, driving or propelling the same along or upon the streets of Buffalo, and authorizing the Common Council to prohibit the use of such

streets and public places of the city by such owner who refuses to pay such tax and penalty,' so plainly contravenes the provisions of the general motor vehicle law that it does not admit of serious discussion. Nor does it matter that the Common Council, in framing the ordinance, has gone to the extent of preventing the automobile from using the streets, as authorized by the law; the ordinance is passed pursuant to that law, which law is inconsistent with and contrary to the provision of the general law, and is therefore repealed by Section 7 of such general law; and the law authorizing the ordinances being repealed, clearly the ordinance itself becomes null and void."

While the decision is regarded as a big victory by local automobilists, the proposition of the Board of Assessors to make autos personal property assessments is causing much serious thought on the part of autoists in this city.

THOUGH apparently of standard design throughout so far as external appearance goes, the new Griswold runabout depicted here, and which is the work of J. P. Lavigne, well known to the automobile trade through the force-feed oiler that bears his name, stands revealed as something very much out of the ordinary, once its bonnet is lifted. A review of its specifications—5 by 5 inch, 16-horsepower, two-cylinder opposed motor, friction transmission, shaft drive, and similar details—gives no inkling whatever of the unusual arrangement in which these various essentials are grouped.

The motor is of the standard four-cycle, two-cylinder opposed type, barring minor changes necessitated by the position in which it is placed, which is longitudinally under the hood, with the flywheel underneath and the crankshaft vertical. Beneath the flywheel is placed a friction wheel, making contact with it. This friction wheel is arranged to slide longitudinally on a level horizontal shaft and is splined on it so as to turn with it. An extension of this horizontal shaft to the bevel gearing on the rear axle comprises the drive, one universal joint being interposed. Another unusual feature that is bound to attract the observer's attention at first sight is the starting device. The upper end of the crankshaft terminates in a bevel pinion meshing with another of about half the size on a horizontal shaft that extends rearward through the dash of the car, its end being fitted for the reception of a starting crank of the ordinary type, so that the car may be got under way from the seat, even though it be necessary to crank it. As it does not interfere with anything, this horizontal shaft may be allowed to turn without inconvenience, but provision is made for taking the small bevel out of mesh by means of a hand nut.

The position of the engine has been taken advantage of to install a unique and extremely simple system of lubrication. The crankshaft is partly hollow down as far as the center of the lower bearing. At the middle of each crank and pin bearing is a radial hole, one lead of a three-feed Lavigne oiler connecting with the hole in the upper bearing of the crankshaft, passing down through the hollow shaft by gravity and out on the crankpins and lower bearing, the surplus collecting in a circular groove at the bottom of the case, from which it is again

brought into action by a small scoop attached to the lower web of the crank. The other two feeds from the oiler are taken to the tops of the cylinders at a point registering with a groove on the pistons when the latter are on the upper dead center, an oil ring being placed at the outer end to aid in spreading the oil. As a further means of lubrication, particularly in case one of the bearings should run hot, a compression grease cup is attached to the upper end of the crankshaft. As at present arranged, the oiler is placed quite high and driven by a belt, but it is the intention to lower it and use a gear drive. A Briscoe cellular radiator

completes the cooling system of the car, which operates on the thermo-syphon principle, while a Heinze coil and Quad timer, and a battery of dry cells constitute the ignition system.

It may appear at first sight as if the new Griswold car were the first born of some amateur entrant into the field with a cherished theory to realize, but as a matter of fact Mr. Lavigne is really one of the pioneers of the industry. As far back as 1899 he built a car driven by a three-cylinder, vertical, two-cycle engine located under the body and driving through spur gears to the rear axle. The engine had a 4½-inch bore and stroke and in 1902 it was built into a larger car than had marked the first attempt. In this instance an individual clutch system was employed to give the speed changes and the drive was by means of spiral gearing. The wheelbase was 110 inches and the body a side-entrance tonneau, while the engine was placed in front and the drive was by means of a horizontal shaft, so that the car combined all the features of present-day construction. In 1904 Mr. Lavigne designed

another smaller car, known as La Petite, of which a small number were built. The plans of the company include the building of a 10-horsepower runabout with a 90-inch wheelbase, a 15-horsepower touring car with a 100-inch wheelbase, and a 20-horsepower touring car with a 110-inch wheelbase. The builders are the Griswold Motor Car Company, Detroit, Mich., recently organized with a capital of \$200,000, and with headquarters at 521 Lincoln avenue.

OPERATING LEVERS AND DASH.

UNDER VIEW OF THE GRISWOLD CHASSIS SHOWING FRICTION TRANSMISSION.

it will have 17,000 square feet on each floor, of which there are four and two light basements.

Its most distinctive feature when running in full blast will be a permanent exhibition of automobiles, accessories and the like, to which the entire fourth floor is to be devoted. With a view to making the building as light as possible, a very large proportion of the walls is composed of glass, as may be judged from the photograph of the interior showing the fourth floor. The space afforded by the latter is to be divided into 50 combined offices and salesrooms, which are to comprise the units of the permanent exhibition referred to. Under prevailing conditions it is now very

WITHIN the past few years the development of New York's automobile row has been little short of stupendous. Some of the more prominent American manufacturers have invested amounts of capital in providing quarters for their branch houses and have erected buildings of a nature that leaves little doubt as to their faith in the permanency of New York City as a selling center for the automobile. But while such houses have been erecting the palatial buildings—for they are nothing less—that dot upper Broadway at intervals of a block or two for a matter of two or three miles, a similar amount of attention has not been paid to the needs of the smaller manufacturer.

Recognizing this, a corporation known as the Motor Mart of New York has been organized by A. T. Otto and F. E. Malone to develop the possibilities of the building located at the corner of Sixty-second street and Broadway and which has been christened the Motor Mart. This structure was originally erected more than a year ago, especially with a view to housing automobile garages, but its builders evidently had little definite conception of the requirements of this business. It is of steel and concrete construction throughout and modern in every respect, but aside from being fireproof it was hardly any better adapted to the purposes of a garage before its present holder took possession than are many buildings which were never designed for the purpose. It had 30-foot ceilings but was totally minus either elevator or heating service. This the new company has remedied by building in two additional floors as well as installing large electric freight and passenger elevators and a steam heating plant, in addition to which other facilities will be provided. The building measures 116 feet on Broadway and runs 173 feet east on Sixty-second street. At present it provides 14,000 square feet of surface per floor, but, with the addition of a 25-foot L extension facing on Sixty-first street.

difficult for the small out-of-town manufacturer who is not otherwise represented in the metropolis to obtain adequate space and facilities in New York's automobile row, and due both to its favorable location and the excellent facilities it affords for the purpose, there seems to be little doubt that the idea will appeal favorably to a sufficient number of small manufacturers to make the holding of a permanent exhibition of the kind a feature of the New York trade.

That the selling end of the New York industry, which found itself indifferently situated with regard to quarters when the new Motor Mart was thrown open, has not been slow to recognize the advantages of location and up-to-date housing afforded by the latter, is shown by its present roll of tenants, although the work of remodeling the building is not yet quite complete. For instance, at its southerly end, the Diamond Rubber Company has established its New York branch house in a manner equaled by few similar establishments in the world. The original 30-foot ceiling of the building was left undisturbed with the exception of the rear end of this imposing office, which has been bridged by a special balcony. The fittings are in keeping with its size and prominence. Other tenants on the Broadway side of the

ONE FLOOR OF THE MOTOR MART DESIGNED FOR A PERMANENT CAR EXHIBIT.

ground floor are the Mitchell Motor Car Company, of New York, handling the Mitchell gasoline pleasure and commercial vehicles, while on the Sixty-second street corner the General Vehicle Company, of Long Island City, shows some of its large line of electrics. Back of the latter, on Sixty-second street, is the branch house of the Oscar Lear Automobile Company, builders of the Frayer-Miller cars, while just behind them is the Motor Sales Company, which concern represents the interests of the Detroit builders of the De Luxe car. The New Amsterdam Oil & Grease Company and the Ennis Ruef Tire Company complete the list at present on the ground floor, though the Colt runabout is a prospective addition, while the Imported Car Repair Company is located in the basement, though it is the intention of the corporation to lease part of the latter together with the upper floors to those firms requiring combined office and garage facilities.

On the second floor, along the Broadway side, Percy Owen has already installed the Bianchi cars in an elaborate setting, another well-known firm which has taken up its headquarters here being the Winchester Speedometer Company. Other firms on this floor are the Tiger Tire Company, the A. Franck Company, the W. L. Fry Company, J. T. Finn & Co., and the Auto Specialty Company, while the shock absorber contingent is to be represented by the Kilgore Shock Absorber Company. On the same floor the Automobile Trade Association and the Automobile Press Association both have their headquarters.

At the present writing both the third and fourth floors are still undergoing the finishing touches of the reconstruction process in order to fit them for the purpose in view, as is also the case with some of the other details of the building, but with the latter housing its full complement on three floors and with the Motor Mart exposition a permanent feature of the fourth, it will represent a center of automobile activity of which there are few equals in the country.

### JUST AS IT CAME FROM PELLETIER'S PEN.

Furnished by the Press Bureau of the Ford Motor Co., Detroit, Mich.

It wouldn't have happened if his name had been an unusual one; but his name is Smith, and he lives in a small town in Vermont.

He owns a Ford runabout that he purchased from Charley Fay, manager of the Ford Boston branch. The car had been running fine for several months, and Smith had written several times to say how delighted he was. But one day there came a change in the form of a letter that detailed all the ills a motor car is heir to, and winding up with a request for immediate information as to what to do to make the motor perform as of yore. Fay diagnosed the case as well as he could, and sent him a bunch of "absent treatment" by return mail. But it was of no use. A telegram stated all the expedients suggested had been tried, but the motor would not "mote." Fay wired for more symptoms. In reply he received information that the engine, after much cranking, would start, run for a few seconds, smoke, spit and emit a terrible stench. "Seems as if it is running hot," ended the telegram. Fay suggested examining the pump, commutator, carburetor, coil and everything else he could think of, and concluded by advising to "Put plenty of oil in the engine base." Smith replied, "Nothing doing." Then Fay got him on the telephone.

"What kind of cylinder oil are you using?"

"Same as you sent me last week," replied Smith hotly.

"That's good cylinder oil," said Fay; "but I cannot understand the engine heating. Put in some more oil."

"Got the case half full now," yelled back Smith.

"Well, put in some more," replied Fay, as he slammed the receiver back on the hook.

In half an hour a telegram told Fay he could send an expert to make the car run or take back his old machine.

It was in the middle of the selling season. Runabouts were going at the rate of ten a day, and every competent man was re-

quired to tune up the new ones. But there was no way out of it—a man must be sent.

"Half a day to go, half an hour to make the engine run, and another half day to return," growled Fay. "Wish that fellow could think of one symptom he didn't tell me, so I could tell him what ails his car."

Man was absent three days. When he returned he met the infuriated manager, who asked: "What on earth kept you so long; what have you been doing?"

"Took his engine all apart, cleaned it, and put it back in."

"Why—what was wrong with it?"

"This," said the man, setting a can of light brown liquid before his chief.

"That looks like good cylinder oil," said Fay.

"Looks like it—yes—that's the trouble. It's maple syrup!"

Strange as it may seem, there are two Smiths in this Vermont town. A friend had shipped a can of maple syrup to one, on the same day and by the same express company that was carrying the can of cylinder oil from Fay to the Ford owner. Cans got mixed en route. When the expert took the motor apart he found the cylinder full of maple sugar, the bearings full of syrup, and the muffler choked with the half-burnt wax.

Fay is now wondering how the other Smith relished the cylinder oil on his pancakes.

### TWENTIETH CENTURY HUNTING IN TEXAS.

DALLAS, TEX., July 27.—Probably for the first time in its history has the automobile been utilized in the rôle of the hunter's steed. As an aid to hunting, it has become almost common, but its rôle has been confined to that of a method of transportation and nothing more, though its ability to cover long distances has made it particularly valuable for this purpose. In the instance under review it actually played the part of hunter. A party left Tahoka, Tex., in two touring cars one day last week and proceeded about twenty miles east of that place on the J. B. Slaughter range. Three antelope were jumped on the open plain and both cars were immediately started in chase. The antelope has always been considered the swiftest runner that walked on four legs, and any attempt to chase it previously would have been worse than useless. Even with the superior speeding powers of the automobile, seven miles were covered before the fleet animals were overtaken and one of the party, skilled in the use of the lasso, easily roped a big buck from the front seat of the car, which was subsequently released. This is doubtless the first case on record of an antelope having been run down, and it goes without saying that the seven-mile chase provided sport of a rarely exciting nature. The party was composed of Judge F. M. Bartley, W. S. Swan, Dr. S. H. Wyndom and T. Simmons, of Tahoka; H. Ford, of Austin, and O. B. Helley, of Garza county, Tex.

There is a movement afoot to provide the public commissioners of Dallas with an automobile for their use in traveling round the town, many of the business men of the city being enthusiastic about the project, even to the extent of planning to circulate a monster petition in its favor. But Mayor Hoy and Commissioner Doran have thrown cold water upon it as a luxury to be foregone until the time when the automobile can be operated more economically than at present.

### PIERCE MAKES BIG FACTORY ENLARGEMENT.

BUFFALO, N. Y., July 29.—Additions are to be made to the factory facilities of the George N. Pierce Company by the erection of a third story to the body-building department, giving an increased floor area of 45,000 square feet. The contract for the work has been awarded to the Trussed Concrete Steel Company of Detroit. In building their new plant, which has a floor area of over 325,000 square feet, and was completed less than a year ago, the Pierce Company secured a fifteen-acre tract advantageously situated on the old Pan-American Exposition grounds, with the New York Central belt line close at hand to facilitate shipping.

## A FORD CHAPTER OF SELDEN ACTION. AUTO ENGINEERS MEET AT BUFFALO.

As the testimony in the so-called Selden litigation—the action of the Electric Vehicle Company *vs.* the Ford Motor Company, over the Selden patent—now totals more than 6,000 long type-written pages, it is hardly to be expected that anyone other than those directly interested would be apt to remember any details of it. But Dugald Clerk, who was brought over from England by the complainants as an expert witness, on the stand admitted that the Lenoir patent undoubtedly antedated that of Selden by many years, but was positive that such an engine could not be built light enough to allow of its application to a road vehicle. Henry Ford seized the opportunity thus presented and built a 7 by 7 Lenoir engine, on which the patent dates back to the early sixties and equipped it with a Festugier carbureter that was especially designed to be used in connection with the Lenoir engine and was patented in 1865. The whole was mounted on a regular 1903, single-cylinder Ford chassis, and neither in its action nor its appearance, with the exception of the huge barrel-like brass carbureter fastened to one side of the body, and which measured 8 by 24 inches, could the car be distinguished from the standard product of that day.

It was put through its paces on Monday afternoon last in the vicinity of the Broadway store of the Ford Company for the benefit of a number of the witnesses on both sides and a gathering of scribes, who took turns in testing its ability. It was run backward and forward at a good pace, started easily by cranking from the seat, and was even started on the spark, showing that it was thoroughly broke and could perform all the regulation stunts that any well-bred automobile could be expected to do. Its ability to run throttled down would easily gain it a record, as it would run so slowly with the throttle closed that a stop seemed imminent between explosions, despite which it could be speeded up and the car made to travel at a rate that would easily break more than one speed law.

This and a great deal more were matters of common observation by those present, and they were duly enlarged upon by the press agent. Those who viewed the test included Prof. R. C. Carpenter, of Cornell; Charles E. Duryea, consulting engineer of the A. M. C. M. A.; John P. Murray, attorney for the Panhard interests; Hugo Gibson, one of the expert witnesses brought over by the complainants at the same time as Dugald Clerk; Judge R. A. Parker, the Ford attorney; Jesse Smith, a Ford expert; Alfred Reeves, general manager of the A. M. C. M. A.; R. S. Crawford, of the Crawford Motor Car Company; Gaston Plain-tiff, manager of the New York branch of the Ford Company; Paul Lacroix, of the Renault Company, and R. M. Barwise.

During the morning of the same day a demonstration was given of the old Selden motor, which, however, was not public and was only attended by the lawyers and witnesses on both sides. It was not said to have been an unqualified success, but the publicity department of the Licensed Association did not wish to make any statement regarding it on the ground that it in no way concerned the litigation in question.

### GEORGE DAY REJOINS LICENSED ASSOCIATION.

Due to the recent resignation of M. J. Budlong as president of the Electric Vehicle Company, Hartford, Conn., a somewhat unexpected result has followed in the election of George H. Day to fill the vacancy thus created in the Executive Committee of the Licensed Association of Automobile Manufacturers. It will be recalled that Mr. Day for some time held the presidency of the Electric Vehicle Company, and only recently resigned the general managership of the Licensed Association, so that it would be difficult to find any one more thoroughly conversant with the affairs of both organizations. On this account, the Electric Vehicle Company requested that Mr. Day be elected to fill the vacancy created by Mr. Budlong's resignation, which was done at the meeting on Tuesday. He will not resume his connection with the company in any official capacity on that account.

The midsummer meeting of the Society of Automobile Engineers, held in Buffalo on Monday and Tuesday last, was combined with that of the Mechanical Branch of the Association of Licensed Automobile Manufacturers.

Sessions were held on Monday at the rooms of the Automobile Club of Buffalo, papers being read on steels and their properties in the morning, which were followed by an extended discussion of the magneto during the afternoon and evening. This included the reading of a paper by E. T. Birdsall, chairman of the committee on magnetos of the Society of Automobile Engineers. The paper was profusely illustrated by lantern slides. Otto Heins, representing Robert Bosch, advocated a closer relationship between the automobile manufacturers and the magneto makers.

The remainder of the meeting was devoted to an inspection of the plants of the E. R. Thomas Motor Company and the George N. Pierce Company, which are said to be the largest and most completely equipped of their kind in the world. After going through the Pierce plant, the engineers were taken over into Canada for a ride in a number of Pierce and Thomas cars, crossing the river and returning via Lewiston and Niagara Falls to Buffalo.

The following members of the Mechanical Branch were present: H. E. Coffin and F. P. Nehrbas, E. R. Thomas Company; A. L. Riker and E. F. Russell, Locomobile Company; Charles B. King, Northern Motor Car Company; D. Ferguson and Duncan H. Pierce, George N. Pierce Company; Charles R. Greuter, Matheson Motor Car Company; E. T. Birdsall, Selden Motor Vehicle Company; C. E. Calkins, Studebaker Automobile Company; J. G. Perrin, M. Z. Viau and M. S. Young, Lozier Motor Company; G. A. Dunham and R. M. Jackson, Olds Motor Works; Lindley D. Hubbel and Frank W. Cooke, Pope Manufacturing Company; Henri G. Chatain, Waltham Manufacturing Company; H. P. Maxim, Electric Vehicle Company; John Wilkinson, H. H. Franklin Manufacturing Company; J. A. Baumgardner and John G. Utz, Autocar Company; J. S. Worthington, Haynes Automobile Company; Frank Johnson and E. E. Sweet, Cadillac Motor Car Company, and Walter L. Marr, Buick Motor Company.

### GARFORD COMPANY ENTERS LIST OF MAKERS.

Behind the simple announcement that the Garford Company has decided to enter the automobile market proper with a car to be known as the Garford, rated at 40 horsepower, and which will be on view in October next, lies one of the most radical changes in the New York trade that has occurred along the "row" in many months. William B. Hurlbut and C. R. Teaboldt, respectively manager and assistant manager of the Packard Motor Car Company's branch in this city for the past three years, have severed their connection with the latter firm to organize the Garford Motor Car Company of New York, of which Mr. Hurlbut is president and general manager and Mr. Teaboldt secretary and treasurer. The new company is capitalized at \$300,000.

The importance of the entrance of the Garford Company into the automobile field will be realized when it is stated that a very large percentage of all the automobile parts of several kinds that are manufactured in this country have their origin at this concern's factories in Cleveland and Elyria, O. It was among the very first to take up the making of automobile parts on a large scale, and has done a tremendous business, so that the extent of its facilities for turning out work of this kind places it in an excellent position to build complete cars. Messrs. Hurlbut and Teaboldt recently made a test trip in one of the first Garford cars and were so pleased with it that they decided upon the action already mentioned, severing their connection with the Packard interests last Saturday. It is expected that the new car will be on the market in numbers by October 1, and that a detailed review of their specifications will be found to reveal a number of constructional innovations, though the car as a whole is patterned strictly along recognized lines of standard practise.

AN INDIANA CAR THAT MADE A LONG SOUTHERN TRIP.

The Model car above illustrated recently completed a trip from the company's factory at Peru, Ind., to Tampa, Florida, over the mountain roads of Kentucky and Tennessee, said to be the worst in the country. Mr. Hixon, the Tampa agent, made the trip to demonstrate the fact that a two-cylinder car could do it.

## ELECTRIC 'BUSES PLEASE QUAKERS.

PHILADELPHIA, July 29.—After a fortnight's operation, the initial line of automobile omnibuses established by the Auto Transit Company, of this city, has been pronounced by the Quaker City public as an unqualified success. Harassed for many months from every side by grafting politicians in city councils, who seemed unwilling to grant a long-suffering public the boon of a much-needed addition to its transportation facilities, the Auto Transit people persistently stuck to their guns, and finally won out when, early in the present month, Mayor Reyburn signed the ordinance which gave them a legal right to operate their vehicles on the Broad and Diamond streets route between the Bellevue-Stratford and the Diamond street entrance to Fairmount Park.

Although but twelve of the twenty-five vehicles which will constitute the rolling stock of this initial route are in operation, owing to the incomplete state of the company's charging plant and garage at Thirty-third and Dauphin streets, the full complement of 'buses will be put on the line by next Monday, by which time the additional motormen and conductors who are now being drilled will be ready to take hold. With its present equipment the company is starting one of its 'buses from each of the termini every seven minutes. By August 15, says General Manager J. M. Hill, the line will be run on a three-minute headway, and if necessary the 'buses will, by October 1, be running under a one-minute headway during the morning and evening rush hours. When the present line is firmly established, the Auto Transit people will

ONE OF THE NEW MOTOR 'BUSES THAT PHILADELPHIA USES.

turn their attention to the southern line, in all probability running south on Broad street to League Island and return, with possible feeders on an east and west street with free transfers.

The five-cent fare with no one allowed to stand—a policy which the Auto Transit Company announces it will adhere to—is meeting with the approbation of the local public, and the 'buses are running full in both directions at all hours of the day.

The Commercial Truck Company of America, which built the vehicles for the Auto Transit Company, is working night and day on the second installment of 25 'buses, which will be slightly larger and capable of carrying 40 passengers each as against the seating capacity of 36 of the vehicles now running. The 'buses are all built under the Imperial four-motor four-wheel-drive patents, each motor being 2 1-2 horsepower.

## GREAT CHADWICK SIX TOURABOUT FOR 1908.

At first glance it would scarcely be realized that the power plant of the natty car shown by the accompanying photograph was fitted with a six-cylinder engine, so well proportioned are its lines throughout. It is the runabout counterpart of the Great Chadwick Six, recently described in detail in these columns, and has been christened a tourabout, owing to the unequalled facilities it offers for this service. Special attention has been paid to

HOW THE GREAT CHADWICK SIX TOURABOUT SHOWS UP.

making it as attractive and compact a car as possible, and wherever alterations from the touring car were necessary to attain this end they have been made, so that it is not merely a runabout body on the same chassis, but a special design which really speaks for itself in this respect. The makers are devoting considerable attention to this model and quite a number are being produced for the coming season.

## TRADE DOINGS IN QUAKERVILLE.

PHILADELPHIA, July 29.—The local automobile trade was recruited last week by the advent of W. L. Edison, son of the inventor, who will represent the 40-45 Colt Rapid Fire car locally. He is associated with H. M. Fernald of this city, and will temporarily carry on business at the Bellevue-Stratford garage. Later the new concern expects to establish quarters on "Gasoline Row."

George Barbier, the well-known actor, but recently connected with the local Rambler branch house, has decided to return to his Thespian first love, and, in company with Eddie Middleton, will form a stock company for a season at the Forepaugh Theater.

Gilbert S. Smith, head of the Hamilton Auto Company, local Stoddard-Dayton agents, and who has attained fame by entering his cars in every competitive event he could conveniently reach—and winning out—has found it necessary to considerably enlarge the company's present quarters at 206 North Broad street. He ascribes the Stoddard's rapid jump in popularity to the wide publicity given the car's triumphs in the local and trade press throughout the entire country.

### RULES FOR BRIGHTON BEACH 24-HOUR RACE.

For the August 8-9 twenty-four-hour contest, to be held at Brighton Beach, N. Y., under the auspices of the Long Island Automobile Club, A. R. Pardington, acting chairman of the A. A. A. Racing Board, has issued special rules for this form of racing. Two kinds of twenty-four-hour races are provided for. Class A is an endurance race limited to one car and only two drivers, while Class B is a relay event in which two cars of the same kind may be used with not more than three drivers to pilot them. Regulation stock cars, described in manufacturers' catalogues, are the only vehicles permissible in these long events. Extensive preparations are being made for the Brighton Beach event.

### MAXWELL OFF FOR CHICAGO, BONNET NAILED.

It was a more than ordinary sealed bonnet test that the little 16-20-horsepower Maxwell undertook when, after traveling about 1,500 miles, it joined in the Glidden tour and came eastward to New York. Still with its bonnet nailed down, it has started westward again and expects to reach Chicago without any tinkering with the seals. The start was made from 317 West Fifty-ninth street, New York, at 10 o'clock on Wednesday morning.

THE "16" REO AT THE SWISS VILLAGE, JAMESTOWN

To show that the strenuous two weeks of the A. A. A. Tour were far from being a measure of its capacity to get there and back, the 16-horsepower Reo was started on another journey to Jamestown immediately after the conclusion of the tour and without making any adjustments or repairs. The trip was made as non-stop dash and was finished in 24 hours without an incident.

### FROM NEW YORK TO BUFFALO IN 21 HOURS.

BUFFALO, N. Y., July 29.—With the Packard "24" which he had driven in the 1906 and 1907 A. A. A. Tour, Gus. Buse, Jr., started from the Knickerbocker Hotel in New York on Thursday morning last, after the completion the day before of the big tour, and arrived in Buffalo in twenty-one hours. Roads between the two cities a great part of the way were dusty and in poor condition.

### NEW FIRM TO BUILD AIR-COOLED CARS.

COLUMBUS, O., July 29.—Under the title of the Harmer Motor Car Company of Columbus, a company has been incorporated here with a capital stock of \$100,000 to build automobiles employing a new air-cooled motor, which is the invention of Frederick S. Harmer. The motor is cooled on the blower principle and 40-horsepower touring cars and runabouts, as well as a three-ton delivery truck, will be turned out on a large scale. One of the cars, which was built recently, has shown up very well under test and it is the intention of the company to build or lease a manufacturing plant and begin business in the near future. The incorporators are Frederick S. Harmer, P. Scott Stafford, E. H. Holterman, J. E. Ward and W. M. Parsons.

J. W. DAVID IN A MORA ON A STIFF GRADE

### TESTING OUT MORA CARS IN THE HILLS.

Western New York offers an unusually favorable testing-out ground for cars, as is evidenced by the accompanying photograph, depicting John W. David driving a Mora car up what is claimed to be a 45 per cent. grade, on the high gear. Newark, N. Y., where the factory of the Mora Motor Car Company is located, is situated close to Rochester, of which it is practically a suburb, and it is surrounded by numerous hills and endless miles of rough roads, which appealed to the builders of the Mora very strongly as a testing ground, and really constituted an inducement toward locating the works there. J. W. David, the driver, is the son of William P. David, president of the Kelsey Motor Car Company, Philadelphia, who are agents for the Mora in that territory. Young David is the possessor of a number of trophies won on the Point Breeze track, and since going with the Mora people has developed into one of the company's best testers.

### BRUSH TO MANAGE PACKARD N. Y. BRANCH.

W. A. Brush, formerly assistant to S. D. Waldon, general sales-manager of the Packard Motor Car Company, Detroit, Mich., has just succeeded W. H. Hurlbut, as manager of the company's New York branch, due to the latter's recent resignation to go with the Garford Company, as detailed elsewhere in this issue. Mr. Brush is one of the old-timers of the selling end of the automobile trade, and was formerly associated with W. A. Metzger in the sales department of the Cadillac Company in Detroit.

A FRANKLIN IN ONE OF ITS DUAL ROLES

Carl Hohoff, manager of the Alaska Fur Company, Grand Rapids, Mich., gets all there is to be had in the way of service out of his Franklin car, which he utilizes for business purposes in the delivery of furs and for pleasure by substituting a detachable tonneau in place of the delivery box shown in the photograph.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY.

Allen Pirie, of Carson, Pirie, Scott & Co., Chicago, has bought the famous Tincher 80-horsepower racer and it is now converted into a high-powered roadster for Mr. Pirie's use.

The Warner Gear Company, Muncie, Ind., is adding a two-story factory, 155 by 144 feet, immediately adjoining their present plant, and expect it to be in use within sixty days.

Cullman Wheel Company, 1027 Dunning street, Chicago, have added two stories to their main factory building and are equipping it with additional machinery to take care of their increased business.

Out of the 48 cars that finished the strenuous two weeks' run of the recent A. A. A. tour, 36 cars, or 75 per cent. of the entire number that completed the distance, were equipped with the Warner Auto-Meter, according to the makers of the latter.

The Pierce Engine Company, Racine, Wis., will have for 1908 a line of three cars: a 40-horsepower four-cylinder, \$3,000; a 30-horsepower four-cylinder, \$2,000, and a 24-horsepower, two-cylinder, \$1,350, details of which will be announced shortly.

Pancho Hernandez, a Puerto Rican who is the proud owner of a Winton Type X-I-V, has been showing the natives what it can do, and recently established a new record over the military road from Ponce to San Juan, covering the distance in four hours.

E. R. Thomas is again to head the E. R. Thomas Motor Company, of Buffalo, as president, having just been re-elected to that office at the annual meeting. The other officers for the ensuing year are: Edwin L. Thomas, vice-president; J. M. Edsall, treasurer, and Ellicott Evans, secretary.

The Raino Company, manufacturers of automobile waterproof clothing at 735 South Halsted street, Chicago, have just booked an order for 5,000 military capes to be supplied to the Cuban Rural Guard, the order being secured in the face of considerable competition, as bids were publicly advertised for on this equipment.

The Bellefield Motor Company, of Pittsburgh, has been incorporated with a capital of \$100,000, making it one of the largest concerns of its kind in the Steel City. The incorporators are: Charles M. Johnston, J. H. McClaren, John H. Langdon, Frank P. Blackmore and George D. Kelley. It is the intention of the company to operate in the East End.

Buffalo's aldermanic committee on fire protection having reported in favor of purchasing an automobile for the use of Fire Chief McConnell, bids were advertised for a high-powered car. The E. R. Thomas Motor Company offered a Thomas Flyer at \$4,000 and the George N. Pierce Company tendered a Pierce Great Arrow at \$3,000, their offer being accepted.

At least one of the towns along the Hudson has come to the conclusion that 10 miles an hour is too low a speed limit for automobiles and has decided that an increase of 50 per cent. would still be within reasonable bounds. This is Irvington-on-the-Hudson, the village authorities of which have recently decided to raise the permissible speed limit to 15 miles an hour.

In the recent A. A. A. tour figures compiled for the Diamond Tire Company showed that the 72 cars in the run used a total of

95 tires in addition to their original equipment. Of this number, 33 cars equipped with Diamond tires are said to have used but 14 tires all told in addition to those on the wheels at the beginning of the tour, and in no case, it is said, were Diamond tires responsible for a penalization.

As a result of the action of Director of Public Works Shepard in putting out of business a 'bus line that had no franchise and the fares of which were said to be extortionate, public sentiment is growing in favor of the city of Pittsburgh, undertaking the work of running an automobile 'bus line through Highland and Schenley Parks for the benefit of the thousands of people who visit them.

"It's surprising the good influence it has over employees for them to hear that their factory's product is making good," says Manager Schaaf, of the Pope Motor Car Company. "I can feel the results from the excellent reports we are receiving about our cars, even among our humblest laborers. Every one of the 1,800 men is imbued with the spirit of the Pope-Toledo enthusiasts and is going round with a chip on his shoulder."

Probably the largest manufacturer of tufting machines for making cushions, backs and upholstered parts is now the Novelty Tufting Machine Company, of Chicago, which has its machines in such well-known automobile factories as Pierce, Peerless, Pope, White, Thomas, Woods, De Luxe, Dayton, Oldsmobile, Buick, Whiting, Cadillac, Northern, Dolson, Dorris, Jackson, Reo and St. Louis. In addition eleven firms trimming cars for the trade are users of Novelty machines.

Roomy quarters having been provided for the New York Trade Automobile Association in the new Motor Mart, Broadway and Sixty-second street, by F. E. Malone. Manager E. V. Stratton says it will be the purpose of the association to place a meeting room at the disposal of any automobile interests desiring these facilities. Desks, chairs, and other necessary equipment will all be provided and doubtless the offer will be appreciated by the automobile fraternity, as the need of such a meeting room in a convenient location has long been felt.

In the counties of northeastern Ohio and the level portions of Pennsylvania north of Pittsburgh a movement is on foot for the establishment of a rural automobile mail service. Fairly good roads and the absence of many steep hills makes an automobile by far the quickest method of transportation. Several of the larger distributing centers have already inaugurated the practice and a few machines have been bought. It is claimed that, in addition to the greater rapidity of the service, the first cost of the machines will be more than offset by the greatly reduced number of carriers needed.

Appearances are certainly against the low, rakish-looking car in the eyes of the law, and that drivers of such turnouts occasionally have to pay for the privilege of looking sporty was well illustrated by an incident which came under the observation of Colonel Pardee recently. "We were running along at about 15 miles an hour," says the Colonel, "when a young fellow passed us in one of those smart-looking racers. He was not going particularly fast, and we kept right behind him in a Max-

well runabout, when suddenly a 'cop' stepped out and held him up. We were running at exactly the same rate of speed and no attention was paid to us."

The Auto Top and Trimming Company is the name of a newly organized concern at Pontiac, Mich., the officers of which are: President, E. M. Murphy; vice-president, R. F. Monroe; treasurer, O. J. Beaudette; secretary, M. L. Pulcher; manager, Frank Jacques. A building adjoining the P. O. & N. R. R., formerly used by the Pontiac Buggy Company, has been secured and is now being put in shape for use. It is the intention of this company to furnish bodies trimmed complete, as well as doing trimming and painting auto tops. Other accessories along the carriage line of automobiles will be manufactured also.

As the outcome of the spirited campaign that the New York Automobile Trade Association, working in conjunction with the American Motor Car Manufacturers' Association, has been waging against the steamship companies which have not permitted gasoline trucks to enter on their piers, many of the latter have now been opened to the modern commercial vehicle, and some of the other companies have the matter under consideration. At present the following companies have acceded to the demands of the association: The Enterprise S. S. Company, Brunswick S. S. Company, Maine S. S. Company, New York & Porto Rico S. S. Company, United Fruit Company, and the Ward line.

No. 31 in the Glidden tour, the Walter car entered by E. S. Lea, went through the severe touring competition without any preliminary tuning up, being shipped direct from the factory to the starting point, its preliminary mileage was less than 30. During the run the car shot over a 20-foot embankment without sustaining any injury, the motor still being running when the machine came to a stop. Although two hours were lost in getting on to the road again, control was reached 45 minutes ahead of time. One of the reasons claimed by the makers for the car's wonderful resistance is the use of chrome nickel steel springs, which were so efficient that no shock absorbers were needed.

That the number 13 is not always an ill-omen was amply demonstrated by the Thomas press car in the recent A. A. A. tour that carried this much-maligned numeral and alleged bringer of misfortunes. Probably few cars had less trouble to account for in the whole trip than did the Thomas bearer of the "hoodoo," as three nail punctures were the sum total of its trials. In the meantime, it helped cars out of ditches, lent a helping hand in case of tire trouble, and on one occasion picked up two passengers that had been left at the roadside by another car and carried them 80 miles into Chicago, making a load of seven and baggage. In spite of it all, every day's run was finished on schedule time.

Times have changed somewhat when instead of Americans paying premiums for foreign cars, things are reversed and foreigners have to pay more for an American car than it can be bought for at home. This is the case with the Ford cars, of which numbers are now being sent abroad. In Great Britain the runabout lists at £165 (about \$800), while in Germany and Italy the demand is said to exceed the supply at \$840. In Paris the runabout is said to command

\$1,000, and the Ford Six, \$3,700, as compared with its price of \$2,800 here. The extent of the Ford export business may be gauged when it is stated that regular weekly shipments are constantly being made to England, Germany, France, Italy, Belgium, Austria and Sweden.

Just how much foundation there is for many of the alleged automobile "accidents" was well illustrated by one that took place in Buffalo recently. A girl on her way to work was knocked down by a bicycle as she was alighting from a street car, and was rendered unconscious by being thrown to the pavement. The response to the ambulance not being very prompt, the policeman hailed Charles Miller, one of the E. R. Thomas Company's testers, who was driving by, and the Thomas Flyer, with its oddly assorted trio, reached the General Hospital just as the ambulance was leaving. Within the next twenty minutes one of the daily papers had received telephone calls from no less than fourteen people telling how a girl had been injured by an automobile, the reports giving the car's speed as anywhere from 30 to 80 miles an hour, while the girl was thrown from 30 to 80 feet. Four people said that they had seen the accident, and one was quite certain the girl would not live the day out. Several people also called up the Thomas factory and read the telephone girl a lecture on the criminal carelessness of the automobile driver in general. In the meantime the girl was on her way home with nothing worse than a bad headache—caused by a bicycle.

#### RECENT TRADE CHANGES.

The De Luxe Motor Sales Company, of which S. B. McCoy is manager, has opened up at 1536 Michigan avenue, Chicago, and will sell De Luxe cars.

The McDuffee Automobile Company, Chicago, have given up the De Luxe and Kisselkar agencies and will hereafter confine their efforts to the sale of the Stoddard-Dayton cars.

The Brush McLaren Motor Company, 47 William street, Newark, N. J., have just been appointed general agents for the Brush runabout in the State of New Jersey. The company is managed by Thayer McLaren.

The Appeal Manufacturing & Jobbing Company, Los Angeles, Cal., who represent Morgan & Wright in Southern California, have removed from 940 South Main street to 631 South Los Angeles street. Morgan & Wright's Atlanta, Ga., branch has been

removed from 49 South Forsyth street to 92 North Prior street, the establishment at the new location being one of the finest rubber goods stores in the entire South.

#### PERSONAL TRADE MENTION.

A. E. Vinton, formerly Cleveland manager of the G & J Tire Company, is now connected with the sales department at the factory in Indianapolis.

R. B. Wrigley, formerly associated with the press of Minneapolis and St. Paul, has been appointed advertising manager of the Excelsior Supply Company, Chicago.

Charles B. Shanks, general sales manager of the Winton Motor Carriage Company, Cleveland, O., has his line out for salmon trout in Lady Evelyn Lake, northern Canada.

The Winton Motor Carriage Company is sending Clarence B. Lincoln from the home office to its Seattle, Wash., branch house, where he will act as assistant to Manager Miller.

L. M. Eagye, formerly manager of the Beaver Manufacturing Company, of Milwaukee, Wis., has been elected secretary and general manager of the Franco-American Auto & Supply Company, Chicago.

B. N. Crockett has joined the sales forces of the Northern agency in the Motor Mart, Boston. Mr. Crockett has had long experience as a salesman and has a large automobiling acquaintance throughout New England.

C. C. Fairman has resigned his position as assistant general manager of the York Motor Car Company, Inc., York, Pa., and while it is his intention to continue in the automobile trade, no announcement of his future plans are forthcoming at the moment.

Frank E. Sparks, formerly manager of the auto department of the Excelsior Supply Company, Chicago, has been appointed Chicago Manager for the National Sales Corporation and Weed Chain Tire Grip Company and has opened an office at 1436 Michigan avenue, Chicago.

F. W. Ansley, eastern traveling representative of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., was married July 10 to Miss Mabel McKellar, of London, Ont. Mr. and Mrs. Ansley expect to make their home in one of the larger cities in Mr. Ansley's territory.

A. E. Morrison, who was injured in the automobile races at Lowell, Mass., on the Fourth of July, is still confined to the hos-

pital at that place, as his broken leg has not become sufficiently strong to enable him to be removed to his home in Boston. It is expected this will be done in a short time.

Major J. S. Keenan, who has been superintendent of the Massachusetts Automobile Club ever since the organization of the latter, has recently severed his connection with the club to assume a similar position with the new White garage on Newberry street, Boston, which it is expected will be ready by next September.

Owing to poor health, John Kane Mills, has retired from the presidency of the Dragon Automobile Company, Philadelphia, and has been succeeded by A. L. Kull, H. B. Rawle now being vice-president and manager. Nicholas Roosevelt has resigned as treasurer and T. F. Randolph has been succeeded as designer and superintendent of the works by Charles Kenen.

Frank B. Illsley, Chicago, who has been handling the Stevens-Duryea cars for several years past, has given up the agency and will retire from the retail business for the present, and possibly permanently, as he has some idea of going into manufacturing cars. Mr. Illsley will go to Europe in a few weeks and expects to spend about three months abroad investigating foreign methods of manufacturing. It is rumored in Chicago that the Stevens-Duryea people will open a Western branch in Chicago shortly with Louis Geyler as manager.

#### NEW TRADE PUBLICATIONS.

A preliminary catalogue from Charles Burgess, Jr., of Wenona, Ill., describes a new type of suspension spring, which, according to its inventor, will be placed on the market in a very short time.

The why and wherefore of the Prest-o-Lite tank is clearly put forth in a brochure from the Prest-o-Lite Company, Indianapolis, Ind., illustrated with numerous cuts showing the tanks in use for illuminating purposes on automobiles, boats, and in private residences. The use of the company's compressed air tanks for tire inflation is also explained.

Information on the lubrication of an automobile is contained in an illustrated booklet published by the Vacuum Oil Company, of Rochester, N. Y., under the title "The Preservation of a Smooth Running Machine." The feature of the book is a series of views of scenes on the Vanderbilt and Grand Prix courses, reproduced from leading automobile journals. Two pages of tables giving winners of all Vanderbilt races and all straight-away records made at Ormond are included.

A GROUP OF FRANKLINS THAT PARTICIPATED IN THE RECENT FALL RIVER, MASS., AUTO PARADE.

## INFORMATION FOR AUTO USERS.

**McCord Coolers.**—A system of water-cooling that is essentially different so far as the construction of the radiator itself is concerned, is to be found in the McCord cooler, manufactured by McCord & Co., Old Colony building, Chicago. It consists of vertical water tubes running between an upper and lower water tank and through continuous horizontal radiating plates. The principle is practically that of the fin-tube

FRONT VIEW MCCORD COOLER.

cooler, with the advantage in this case that the fins of each tube are connected to and are continuous with those of the tubes next to it. This results in the entire surface of the metal being called upon to do an equal amount of the cooling irrespective of the amount of water flowing through the tubes, as anyone tube receiving more hot water than another radiates its excess heat to the fins of its adjoining tubes, and even though a tube became stopped up completely, the efficiency of the radiator as a whole would be but slightly impaired as its radiating surface would still be in use. The tubes and plates are sweated together, supporting one another in such a manner as to give the plate cooler a great advantage on the score of strength. This also permits the use of thinner metal, making the cooler as a whole far lighter than the ordinary form of construction. The tubes are 1-4 inch in diameter, and the plates are spaced eight to the inch, the standard plate being 2-3-4 inches wide, this being the depth of the cooler from front to back. There are five tubes in this distance and the radiating surface amounts to 48 square inches for every square inch of front area. The ornamental brass frames of the McCord coolers are independent and readily removable, thus greatly facilitating repairs without marring the appearance of the radiator as a whole.

**Two New Sager Specialties.**—In addition to the Sager Equalizing springs and antiskid chains that have been specialized by the J. H. Sager Company, Rochester, N. Y., for some time past, this firm will soon bring out two additional auto accessories of a special nature, the details of which are not forthcoming at the moment, but which are said to give great promise of success. The Sager Equalizing springs have been meeting with unusual favor during the past season, and some idea of the quality of the material of which they are made may be had from the fact that out of 8,000 sets of springs, but 20 showed flaws of any

nature whatever. In fact, the makers are so confident of their product that they are giving an unusually liberal guarantee, *i. e.*, agreeing to replace any broken part within one year from date of sale. Nearly all the attachments for the springs are drop forgings, and in some special cases the brackets are hand forged. The Sager springs and their making are the outgrowth of 12 years' experience in bicycle saddle making, of which literally millions were turned out in that time.

**The Old Nick Carbureter.**—As the result of fifteen years' investigation and experience of the problem of carburetion, the experience part representing nine years of actual use, the Pioneer Brass Works, 424 So. Pennsylvania avenue, Indianapolis, Ind., may well be said to be in a position to know considerable of the ins and outs of this most vexatious of all problems connected with the internal combustion motor. J. B. Knickerbocker is the inventor of the Old Nick carbureter and he has embodied in its latest and most recent form, which is illustrated herewith, many of the essential features which have seen service for nine years—something that can be said of very few similar devices connected with the automobiles that are on the market at the present day. The sectional view showing the internal arrangements of the carbureter shows its construction so plainly that a detailed description of it is scarcely necessary, the short paragraph to which the makers limit themselves in describing it probably being more than sufficient for all purposes. They say: "This carbureter will work in all positions except upside down, on all kinds of engines; it has a float valve that regulates, and auxiliary valves that auxilerates at the will of the operator, it has a

SECTIONAL VIEW "OLD NICK" CARBURETER.

circular spray nozzle that vaporizes. A double volume of air, one part coming through the center of the circle and the other over the outside meets at the point of the spray nozzle and there vaporizes, making a perfect dry gas." It will be noticed that the device is distinguished both by its extreme simplicity and compactness, the mixing chamber being made dome-shaped.

**An Eliminator of Tire Annoyances.**—After struggling with a punctured or blown-

out tire in heavy rain, under a hot sun or by the side of a mosquito swamp—why do tire troubles generally occur at such places?—the automobilist willingly admits that some more convenient method of changing tires than the old-fashioned one followed for years might be found. Numerous inventions having been tried, it is now pretty evident that the most satisfactory method is to carry an extra rim or two on which are mounted fully inflated tires, which will

CROSS SECTION CRESCENT RIM.

speedily replace the damaged one with the minimum expenditure of labor and the loss of only a few minutes' time. A rim of this type is produced by the Crescent Parts Company, of New York City, and handled by leading dealers under the title of the Crescent—formerly the same rim was known as the Harburg. All the essential qualifications of a dismountable rim, security and absence of binding after long use, are claimed for the Crescent, while the assertion that a tire can be changed in three minutes under this system is substantiated by all who have seen the operation.

**Convertible Two and Four-Cycle Engine.**—Points of superiority claimed for the convertible two or four-cycle gasoline motor as constructed by the North Chicago Machine Company are increased accessibility, flexibility and efficiency. The horsepower can be varied without change of motor speed. This is done by taking advantage of the fact that the chief thing necessary to make the present-day automobile motor convertible from one cycle to the other is a means of admitting and exhausting the charge. The change from the two to the four-cycle motor in this case is made through a double set of cams on the camshaft, all valves being mechanically operated. To the camshaft is connected two sets of gears, one being the two to one type commonly used on the four-cycle motor and the other a one to one gear to drive the camshaft the same number of revolutions as the crankshaft and operate the cams to open the valves in producing the two-cycle engine. In making the change from one type to the other the cam is shifted about one-half of an inch longitudinally, which disconnects the camshaft from the two to one gears and engages it with a set of one to one gears. Camshaft and crankshaft then revolve at the same speed and a new set of cams is engaged to operate the intake and exhaust valves. At the same time the spark timing is changed to conform with changed cycle of motor.

# THE AUTOMOBILE

STEARNS SIX-CYLINDER FREE-FOR-ALL WINNER, DRIVEN BY FRANK LELAND, ARRIVING AT THE TOP OF FORT GEORGE HILL.

NEW YORK CITY can supply a good hill for an auto climb, and, furthermore, the authorities of the metropolis are progressive enough to grant permission for its use. This was made apparent on Saturday last when "The Metropolitan Automobile Association" held a very successful event.

It doesn't matter in the least who are the members of this association, nor that the climb was more or less an idea of the Greater New York representatives of the Stearns car; the event was exceptionally successful and interesting and a good metropolitan advertisement for automobiles.

Invariably the buyers of automobiles in New York City, who are aware of the existence of Fort George hill, ask for a demonstration which includes this difficult incline, its three-eighths of a mile being a tortuous 10 per cent. grade. In addition to testing the capacity of the cars, the hill is also one to try the skill of the drivers, for in its length it not only has two turns to the right, with two more to the left, but where the subway crosses it at Dyckman street on an elevated structure it is badly obstructed by the iron pillars. The start of the climb was placed at Dyckman street, and the cars were given some distance to get under way. While the drivers could take their choice of going either side of the first pillar, they had to leave the second one on the right at a point where the jutting structure of the elevated was not out of the subway far enough to allow much headroom and also where the distance between the pillar and sidewalk was hardly ten feet.

Twenty-seven cars participated in the climb and the fact that of this number five were foreign machines may be taken as an indication that importers are awakening to the value of local contests. The classification of the competing cars was on the basis used in England, and recently adopted here; that is, of rating the cars according to their piston area, a car's standing being calculated by taking the square of the bore and multiplying it by the number of cylinders, the

resulting product being taken as an arbitrary rating. For instance, the rating read: "Class A, 100 and under 125," meaning square inches of total piston area.

A 35-horsepower Simplex, driven by Watson and Al. Poole, Joe Tracy's Vanderbilt Cup race helper, figured unofficially in an accident, which, however, had no serious results, though the damage was aggravated by a careless bystander in throwing a lighted match into the escaping gasoline. It brought home a realization of the danger of the narrow passage under the structure and made the other drivers more careful.

The record-breaking climb of the day was made by Frank Leland and a six-cylinder Stearns and without the necessity of touching the gear lever. The same thing was true of most of the cars, nearly all being "flights on the high." On the whole, the meet showed conclusively that a hill-climb is a drawing card in the metropolitan district, as at the start and finish, and along the entire hill, crowds of auto enthusiasts were gathered. The competition was divided into four classes, Stearns cars taking the honors in two, a Stevens-Duryea in the third, and

a Pope-Hartford in the fourth. In view of the extremely bad spot through which the cars had to pass at speed and on a turn, the times made were remarkably good; doubtless they would have been improved a little had not the accident to Watson and the Simplex caused a change in the original plan of giving the cars a flying start. This was altered so as to send them away with merely a rolling start in order that the driver might have the car well in hand when passing between the pillars.

Owing to the defection of the electrical timing apparatus at the outset, the start had to be postponed two hours and did not get under way until 3 P.M., instead of at 1 o'clock. But then things went without a hitch and things were smoothly managed.

The meet was formally opened when the word was given by Starter Wagner to F. J. Leland, of Cleveland, in a 1908 model, six-

START OF THE STEARNS "SIX."

VIEW FROM TOP OF FORT GEORGE HILL IS FAR-REACHING AND IMPRESSIVE—SIMPLEX NEARING THE FINISH LINE.

cylinder Stearns roadster. He went over the line with but a short preliminary dash from a standstill, and his time of 0:28 1-5 fully met the expectations of those who had had an opportunity to size up the car. It was simply a question of follow the road, once the danger spot had been passed. The second best time of the day was made by C. Schilp, driving a four-cylinder Stearns, who did the distance in 0:32 2-5, and to prove that there had been no error in the timing of the record-breaker it was sent over the course again. Strange to relate, it did the distance in exactly the same time to a fraction. A. J. Picard, in another Stearns, took third honors in 0:35 2-5, the necessity of dropping into a lower gear at one of the turns where the grade is said to be 13 per cent. probably costing him second honors.

In Class C, J. P. Robinson's 35-horsepower Stevens-Duryea swept the field by a good margin, and its time of 0:36 1-5 was better by several seconds than some of the performers of double its power in the preceding class. This was also true of R. T. Peckham's 35-horsepower Pennsylvania, though it required 41 1-5 seconds.

The showing of Edwin Southworth's 30-horsepower Pope-Hartford in Class D was also considerably superior to the performances of several of the cars of double its power, as it reached the top in 0:39 3-5.

The closing event of the program was for the Wyckoff, Church & Partridge Cup, limited to Stearns owners. It was taken by W. A. Tilt in 44 4-5 seconds, with R. G. Morris second in 45 4-5.

The officials were: Referee, A. R. Pardington; timers, Charles J. Dieges, H. P. Burchell, and H. T. Clinton; starter, F. J. Wagner; clerk of the course, T. J. Moore; judge, Carlton R. Mabley. The summaries:

**CLASS A—RATING: 125 SQUARE INCHES OR OVER (PISTON AREA).**

1. Stearns, 90-h.p.; Frank Leland.....28 1-5
2. De Dietrich, 60-h.p.; Wm. Manna.....40 1-5
3. Simplex, 50-h.p.; Al. Poole.....43 4-5
4. Bianchi, 70-h.p.; N. M. Powell.....44 4-5

**CLASS B—RATING: 100 TO 125 SQ. IN.**

1. Stearns, 60-h.p.; C. P. E. Schlupp.....32 2-5
2. Stearns, 60-h.p.; A. J. Picard.....35 2-5
3. Stearns, 60-h.p.; W. I. Fickling.....38 1-5
4. Stearns, 60-h.p.; Arthur Warren.....39
5. Packard, 30-h.p.; W. T. Armstrong....41 3-5

THE POPE-HARTFORD WINNER.

PILAIN, A FOREIGN PARTICIPANT.

THE STEVENS-DURYEA WINNER.

6. Bianchi, 50-h.p.; Felix Prosser.....44 1-5
7. Crawford, 50-h.p.; R. S. Crawford....44 4-5
8. Stearns, 60-h.p.; W. A. Tilt.....45 1-5
9. Isotta-Fras., 35-h.p.; C. H. Hamilton.46 4-5
10. Matheson, 60-h.p.; C. Singer, Jr.....47 2-5
11. De Dietrich, 40-h.p.; Arthur Roskey. 49 4-5

**CLASS C—RATING: 80 TO 100 SQ. IN.**

1. Stevens-Dur., 35-h.p.; P. J. Robinson.36 1-5
2. Pennsylvania, 35-h.p.; R. F. Peckham.41 1-5
3. Bayard-Clem., 30-h.p.; H. A. Vantine.41 2-5
4. Franklin, 30-h.p.; J. H. Manning.....44 3-5
5. Pope-Toledo, 50-h.p.; Joe Judge.....45
6. Stod.-Dayton, 30-h.p.; Ray Howard...48
7. Pope-Toledo, 50-h.p.; Joe Judge.....49 1-5

**CLASS D—RATING: 60 TO 80 SQ. IN.**

1. Pope-Hartford, 30-h.p.; J. P. Grady...39 3-5
2. Corbin, 24-h.p.; Jack Dower.....46 3-5

**CLASS FOR ELECTRICS.**

1. Babcock; H. E. Wagner.....1:53 4-5

**MAINE ROADS NOT INJURED.**

Judge James B. Dill, a prominent member of the A. C. A. and also of the A. A. A. Touring Board, at present enjoying his annual summer camp in Maine, writes that there is no truth in the prevalent reports that the recent cloudburst in Franklin and Somerset counties took away some bridges and interfered with the automobile route to Rangeley Lakes and from Portland, Me., to Quebec. The damage was entirely local, and the Blue Book routes are in better order than last year.

**REMAINS AN AUTOLESS EDEN.**

BAR HARBOR, ME., Aug. 5.—Pulled by a horse or pushed by its owner, no automobile may travel over the forbidden roads of Eden, according to a decision of Judge B. E. Clark. In entering the village a few days ago with his 40-horsepower automobile, Fordham C. Mahony, of New York City, caused his car to be towed by a horse over the first section and on the second forbidden stretch, which was down hill, shut off power and had the machine pushed. In the legal proceedings which followed, the automobilist was fined \$1 and costs, the court finding that the spirit of the law, directed against the passage of automobiles over certain restricted territory, had been violated.

WITH the arrival of 36 "pt-pt-ting" two-wheelers at Hills Grove track at Providence, R. I., on Wednesday of last week there came to an end the sixth national endurance contest held under the auspices of the Federation of American Motorcyclists, and, be it added, one of the most strenuous and consistent tests of the motorcycle and its rider that that progressive organization has ever fostered.

Of the sixty riders who sent their entrance fees to Chairman H. J.

Wehman, many were from distant parts of the Union: Texas, Wisconsin, and the Middle West providing entries, 13 States in all being represented. Of this number 55 faced the starter at 4:30 A. M., Tuesday morning, July 29, and were sent away from Eighty-eighth street and Broadway, New York, in squads of four at one-minute intervals. The competitors were divided into two classes—the first, Class A, for single-cylinder machines, and Class B, for multi-cylinder machines, and it is interesting to note that the winner of the Diamond Medal, Bert T. Barrows, of Springfield, Mass. (21-4-h.p. Indian) was in the ranks of the former aggregation.

The rules governing the contest were very similar to those that characterize automobile runs of the same nature, each competitor starting with 1,000 points initial credit, penalizations being one point for each minute late at controls and two points for each minute early, with an allowance of five minutes for variations in timing. To insure the absence of the long roll of tied scores that has served to rob similar events of interest in the past, Jacob's Ladder in the Berkshires was made the venue of a hill climb, failure to ascend without resorting to the pedals incurring a loss of 10 points, and a dismount 25 points, in Class A, and 25 and 50 points, respectively, in Class B. Moreover, immediately upon arriving at the track in Providence the competitors were given a pint of gasoline and their machines started on an economy run without any adjustments or repairs. This effectually served to make tied scores a practical impossibility.

CLOSING CHAPTER OF THE MEET AT HILLS GROVE TRACK.

The route was from New York to Poughkeepsie, Lakeville, Conn., Lenox, Lee, and Springfield, Mass., the last-named constituting the end of the day's run, a distance of 200.3 miles, the first day controls being at Poughkeepsie, Lenox, Lee, and Springfield. The second day's run was to Providence via Worcester, 105.1 miles, with a single intermediate control at the latter. One of the striking features of the contest was the performance of the German machines and

there is every probability that the American maker, who has thus far not even recognized the existence of a change-speed gear, will come to regard this piece of equipment much more favorably.

Trouble began right in sight of home, so to speak, and some of the competitors who had come farthest to participate in the event went the shortest distance. Deupree, a Tennessean, succeeded in covering only three miles, when, after much fussing, he discovered a dead battery that had been new but the day before. He retired, but rode to Providence as a tourist later. White, a Texan whose appearance belied his name, went only 15 miles, his trouble also being due to faulty ignition, but in his case a magneto was the moving cause and inability to diagnose its ailment put him out of the running. An odd accident retired McLaughlin when he was within a few miles of Poughkeepsie, the stand of his machine becoming mixed up with the rear wheel, wrecking the latter.

Though the first stretch was marked by some bad falls, particularly on a protruding piece of car track at Fishkill, it was not until Poughkeepsie had been left behind that the endurance part of the test became evident. There was a heavy fall of snow to mark the second stretch, so heavy that G. A. Snow, of Hartford, Conn., the particular brand of snow that fell, was laid up for two days with an injured back. The real work of the day was concentrated between the Lenox and Springfield controls. Far too much attention of the "nothing to watch but the road" variety was required to permit any appreciation of the picturesqueness

BARROWS, CHAMPION OF THE ENDURANCE RUN.

THE YALE-CALIFORNIA TRIO FROM TOLEDO, O.

SEIDELL, VICTOR OF THE COLONIAL HANDICAP.

STRAIGHTAWAY EVENT CONTESTED ON THE BLACKSTONE BOULEVARD, PROVIDENCE, ON THIRD DAY OF MEET.

of the scenery afforded by the Berkshires. Thornley, on a 2 1-4-h.p. Indian, had a bad fall which put him out with an injured leg, and W. H. Wray, 5-h.p. Simplex, was delayed by a broken cotter pin in the exhaust valve stem; W. F. Mann, 4 1-2-h.p. four-cylinder F. N., had to hunt an elusive spark, while Koch, a New Jersey Teuton, on a 3-h.p. Merkel, gravely reported: "I don't find my spark any place," with an appropriate accent. G. H. Ruck, also on an Indian, punctured his oil tank.

The site of the climb was about 300 yards long, with a grade varying from 15 to 18 per cent., and a transverse gully flanked by boulders proved a roof on which quite a few hopes were wrecked. Times were not taken, the only requirement being a successful climb. Barrows and Holden, both on 2 1/4-h.p. Indians, were the first up and they made the climb in beautiful style. Then Chapple gave a two-speed gear performance on his N. S. U.

Of the 55 starters, 43 reached Springfield that evening and 42 started the next day, but six of them with their 1,000 points still intact. This number was cut to three by the time Providence was reached, Baker and Holden, second and third, respectively, being eliminated in the economy test with losses of 1 and 6 points by Barrows, who covered 24 miles 3,490 feet on his 2 1-4-h.p. Indian. In Class B, Oscar Hedstrom ran 15 miles 925 feet on a 4-h.p. Indian, but he had lost so many points previously that Cook, on a 5-h.p. Curtiss, with a little less than 12 miles to his credit, was the winner with a loss of but two points. For his performance of 20 miles 1,425 feet in the economy test T. K. Hastings 2 1-4-h.p. Indian, won the private owner's medals and an honor medal for his record of 986 points in Class A. Mr. Hastings left for England last Saturday to compete in the six-day contest of the Auto-Cycle Club of Great Britain, which starts from London.

**NATIONAL F. A. M. MEET AT PROVIDENCE.**

PROVIDENCE, Aug. 3.—The national meet of the Federation of American Motorcyclists opened Thursday with road races on the Blackstone boulevard. W. G. H. Wray's free-for-all straightaway mile in :44 3-5 on a 7-horsepower Simplex-Peugeot was considered the feature of the morning's work, and the twenty-mile Colonial handicap was won by J. S. Seidell, of Springfield, Mass., on a 3-horsepower Reading-Standard. In the afternoon at Hills Grove track the two-mile F. A. M. national championship was won by Walter Goerke, of Brooklyn, on a 4-horsepower Indian. In the two-mile open single-cylinder race, J. S. Pickering, of Providence, was fatally injured, his machine striking a soft spot at the three-quarters pole, skidding and throwing him headlong against the base of one of the posts.

In Friday's races Stanley T. Kellogg on a 4-horsepower Indian was the bright and particular star, winning both the mile and ten-mile F. A. M. national championships at Hills Grove and the hill climb on Francis street. Goerke, of Brooklyn, and Peter Cox, of New Haven, came together in the ten-mile handicap, owing to the dust, both being thrown and sustaining bad scalp wounds, but were otherwise uninjured. The run to Newport, scheduled for Saturday morning, was called off owing to the death of Pickering, who was injured in Thursday's races.

The annual meeting resulted in the following officers elected for the ensuing year: President, R. G. Betts, New York; vice-president, William Suddard, Providence, for Eastern District; E. Y. White, San Antonio, Tex., for Southern District; R. K. Holmes, Los Angeles, Cal., for Pacific Coast District; secretary, Henry J. Wehman, New York; treasurer, G. B. Gibson, West-boro, Mass.

## ATLANTIC CITY'S CARNIVAL GIVES GOOD RACING

ATLANTIC CITY, N. J., Aug. 5.—The annual race meet at this bustling seashore city, included this time as a part of a Summer automobile carnival, began this morning on the beach at Ventnor. The competitive part of the carnival is in the hands of the Atlantic City Automobile Club, with Harry Cook as the experienced chairman of the Racing Committee. Such old-timers as Reeves, Wagner, Burke, Dieges, Clinton, Partridge, Moore, Healy, and Smith are included in the official list. Harry S. Houpt is an interested observer of his Vanderbilt Cup race flyer; F. B. Stearns, the Cleveland manufacturer, is keenly involved in the performance of his fast stable; and Messrs. Lawrence and Moulton look after the B. L. M. racer as though it were a favorite child, which of course it is, since they are its builders. Walter C. Martin, the Rolls-Royce importer, is in evidence, as are many other prominent tradesmen.

Following the races of to-day, to-morrow, and Wednesday, will come a floral parade Wednesday afternoon. Thursday is the day set for the opening of the week's display of automobiles on the famous Young's pier. C. Wood Tatham is the president of the carnival committee, which unquestionably will cause the name of Atlantic City to be printed thousands of times as a result of the annual innings of the autos.

It is anticipated that, as is often the case where stock car events are contested, there will be a substantial number of protests for intentional and unintentional evasion of the exact letter of the rules.

### RESULTS OF THE FIRST DAY'S RACING.

After the regular program had concluded this morning a special mile challenge event took place which proved to be the feature of the competition. Guy Vaughn, driving A. W. Church's

Stearns, defeated the B. L. M. Vanderbilt Cup car, piloted by Frank Lawrence; a Rolls-Royce, with L. R. Burne at the wheel, while Harry Levey's Mercedes brought up the rear in charge of John Barr. The mile was traveled in 0:57 3-5, and the winner had nearly a hundred yards the best of it at the finish. Mr. Levey was the challenger and responsible for the \$500 purse.

The event for gasoline runabouts, of all types, fully equipped, originally had thirteen entries, but after the referee had looked them over only five remained for the race. After F. W. Leland, an added entry, had won with a 30-horsepower Stearns, with A. W. Church and another Stearns second, and W. McIlvrid third with a Thomas, a protest was lodged against the two Stearns cars. Subsequently the referee ruled against the Stearns driven by Leland and dismissed the protest against the Stearns driven by Church. Leland's car was minus a muffler.

The third victory of the day for the Stearns came in the touring car class, \$5,000 or less, regularly equipped.

In the touring car championship, 60 horsepower or less, regularly equipped, and carrying five passengers, the field was reduced to two by the failure of entrants to comply with the conditions. F. H. Hancock's six-cylinder Duryea defeated a 50-horsepower Matheson.

The other winners were an Oldsmobile, which captured two touring car classes, \$3,000 or less, first carrying five passengers and then repeating without passengers; a Maxwell, in the \$1,200 or less runabout division, and a Mercedes in the foreign car class. The summary follows:

#### TOURING CARS, GASOLINE, \$3,000 OR LESS, REGULARLY EQUIPPED (CARRYING FIVE PASSENGERS).

1. Oldsmobile, 35-h.p.; Phila. Motor Shop; driv., T. W. Berger. 1:15
2. Pope-Hartford, 35-h.p.; Miss Alice S. Lyon; driv., Hofman
3. Stod.-Dayton, 30-h.p.; Hamilton Auto Co.; driv., Leinbach

CHURCH'S SIX-CYLINDER STEARNS, WINNER OF SPECIAL MATCH.

- 3. Rolls-Royce, 50-h.p.; W. C. Martin; driver, L. R. Burns...
- 4. Mercedes, 60-h.p.; Harry Levey; driver, John Barr.....

**STEAM CARS, OPEN TO ALL.**

- 1. Stanley, 25-h.p.; driver, D. W. Harper..... 0:53 2-5

**HOUP'T'S VANDERBILT CUP CAR A WINNER.**

ATLANTIC CITY, N. J., Aug. 6.—The feature event of the second day's racing was the free-for-all one-mile championship for

gasoline cars, which united one of last year's Thomas Vanderbilt racers, driven by Montague Roberts; the B. L. M. racer intended for the Vanderbilt, driven by Frank Lawrence; a six-cylinder Stearns, driven by Frank Leland; a 90-horsepower Matheson, handled by J. B. Ryall; Harry Levey's 30-horsepower Mercedes, in charge of John Barr, and a six-cylinder Stevens-Duryea, driven by P. J. Robertson.

In the first heat the Thomas won in :42 3-5, the Stearns being second in :43 1-5, and the B. L. M. third. The Stevens-Duryea beat the Matheson by more than 100 yards in the second heat; time, :50 1-5. A stirring race was witnessed for the final between the Thomas, Stearns, and Stevens-Duryea. Roberts, who got an easy lead, rushed his 120-horsepower Thomas over the finishing line in :40 2-5, the best time of the season and two seconds faster than his previous heat. The Stearns, which also improved on its previous run, was second in :41 4-5, with the Stevens-Duryea fifty yards behind.

An Oldsmobile, driven by T. W. Berger, won a keenly contested handicap for gasoline cars, uniting five starters. A 30-horsepower Stoddard-Dayton was a very close second; the others, a Jackson, Pope-Hartford, and Maxwell, being closely bunched. T. W. Berger also won the Lyons Cup for American touring cars of 30 horsepower or less, in 1:14 1-5, beating a Stoddard-Dayton.

The gentlemen's roadster handicap, uniting eleven starters, found a victor in a 40-horsepower Thomas, driven by W. McIlvrid, defeating a Stoddard-Dayton by about ten yards.

Guy Vaughan won the class handicap for cars with a record of 1:10 or better on a beach track in his 45-horsepower Stearns, defeating D. W. Harper's Stanley steamer by about twenty yards.

All the wires working the electrical timing apparatus having been cut by vandals during the night, some rush work had to be performed to put the apparatus in order again in time for the races. The lowering of Ventnor Beach records was rendered almost impossible by heavy rain, which fell to within a short time of the start of the day's events. This was a reason given for the inability of the Thomas "Cup" car to come closer to Walter Christie's course record of 34 seconds. The summary:

**TOURING CARS, GASOLINE, \$1,500 OR LESS.**

- 1. Jackson, 20-h.p.; Jackson Auto Co.; driver, W. J. Hayes. 1:26 3-5
- 2. Buick, 22-h.p.; Edward Wilkie; driver, Edward Wilkie....

**PRICE HANDICAP, GASOLINE, REGULARLY EQUIPPED, CARRYING FIVE PASSENGERS; \$4,000; SCRATCH; HANDICAP OF ONE SECOND FOR EACH \$200 LESS IN PRICE.**

- 1. Oldsmobile (scratch), 35-h.p.; driver, T. W. Berger..... 1:32
- 2. Stoddard-Dayton (1 sec.), 30-h.p.; driver, E. L. Leinbach...
- 3. Jackson (2 1-2 sec.), 24-h.p.; driver, C. Smith.....

**FREE-FOR-ALL; CHAMPIONSHIP; GASOLINE; FLYING START. (Record Held by Walter Christie; 34 Seconds.)**

- First Heat:
  - 1. Thomas, 120-h.p.; H. S. Houpt; driver, M. Roberts..... 0:42 3-5
  - 2. Stearns, 45-h.p.; F. B. Stearns Co.; driver, F. W. Leland... 0:43 1-5
- Second Heat:
  - 1. Stev.-Dur., 50-h.p.; Stev.-Dur. Co.; driver, P. J. Robinson. 0:50 1-5
  - 2. Matheson, 90-h.p.; Matheson Co.; driver, J. B. Ryall.....
- Final Heat:
  - 1. Thomas, 120-h.p.; H. S. Houpt; driver, Montague Roberts. 0:40 2-5
  - 2. Stearns, 45-h.p.; F. B. Stevens Co.; driver, F. W. Leland... 0:41 4-5

**JOHN H. LYON CUP, OPEN TO AMERICAN TOURING CARS OF 30-H.P. OR LESS, REGULARLY EQUIPPED; CARRYING FIVE PASSENGERS; OWNERS TO DRIVE.**

- 1. Oldsmobile, 30-h.p.; T. W. Berger; driver, T. W. Berger... 1:14 1-5
- 2. Stod.-Dayton, 30-h.p.; P. F. Rockett; driver, P. F. Rockett
- 3. Maxwell, 24-h.p.; Charles Fleming; driver, Chas. Fleming

**GENTLEMEN'S ROADSTER, PRICE HANDICAP, \$5,000, SCRATCH; ONE SECOND FOR EACH \$200 LESS IN PRICE; OWNERS TO DRIVE.**

- 1. Thomas (10 sec.), 40-h.p.; driver, W. McIlvrid..... 1:11 3-5
- 2. Stod.-Dayton (9 sec.), 30-h.p.; driver, E. L. Leinbach.....
- 3. B.L.M. (5 sec.), 24-h.p.; driver, H. G. Moulton.....

**CLASS HANDICAP, OPEN TO ALL CARS WITH ESTABLISHED**

**MARK OF 1:10 OR BETTER ON BEACH TRACK.**

- 1. Stearns (7 sec.), 45-h.p.; driver, Guy Vaughn..... 1:07 2-5
- 2. Stanley Steamer (4 sec.), 25-h.p.; driver, D. W. Harper...
- 3. Matheson, 30-h.p.; driver, F. Lescault.....

MAXWELL VERSUS BUICK, FIRST DAY, MAXWELL WINNING.

GENERAL VIEW IN THE VICINITY OF THE GRANDSTAND—NOTE EXCELLENT ROAD WHICH STRETCHES AWAY INTO THE DISTANCE.

## MINERVAS FIRST, SECOND, THIRD IN ARDENNES CIRCUIT

**B**ASTOGNE, BELGIUM, July 30.—At an average of 59.8 miles an hour, Moore Brabazon, on a Minerva, rushed over the finishing line on the Ardennes circuit, winner of the 372-mile race under German Emperor rules. Twenty seconds later Kooloven had captured second place, also with a Minerva; fifty-two seconds behind was Lee Guinness, the British sportsman, on a third Minerva; an interval of forty-one seconds and Hanriot had piloted a Benz to fourth place; seven minutes twenty-two seconds behind was Hieronymus on a Gaggenau; four minutes twenty seconds more and Warwick Wright's Minerva was over the line and the race was declared finished, those still running being officially ignored. Lovers of keen sport and close finishes could not ask for anything more exciting than a race in which all the contestants rushed to the finishing line in an interval of less than fourteen minutes.

There were twenty-three machines in line when, at 5 o'clock, the starter sent away Warwick Wright, of London, on his Minerva car from Antwerp. Moore Brabazon and Lee Guinness, also from across the Channel, formed, together with Koolhoven, one of the factory representatives, the quartet for the leading Belgian firm. Other contesting machines were three Gaggenau, three Adler, two Ariès, the sole French representatives, three Imperia, three Benz, three Pipe, with Jenatzy as one of their drivers, one Metallurgique, and one Mercedes.

At the outset the three Pipe machines, driven by Hautvast, Jenatzy, and Deplus, set a rapid pace, shaking off all competitors except the Minervas and the Metallurgique. At a third of the distance the Pipes were leading, with Lee Guinness' Minerva hanging close, when accidents of the course put the three ma-

chines which had given Nazzaro so much trouble on the Taunus circuit entirely out of the contest. *Le Terrible Hautvast*, who on the first round had appeared with the remains of a dog adhering to his starting handle, shot over a ninety-foot embankment on his fourth round and was carried to Brussels with slight injuries. Jenatzy overturned at Martelange with very slight injuries, and almost at the same place his team mate, Deplus, met with a similar accident, causing a broken shoulder and a wound on the head, not considered dangerous.

These eliminated, Minerva remained sure for first place, Hanriot alone, on a German Benz, menacing their position. Hanriot, who since leaving Darracq is open to drive for the best bidder, was dangerous for a long time. He was twelfth at the end of the first round, gained one place on the second, two on the third, five on the fourth, and at half distance was but one minute behind the leader. A blow-out on the last round detained him several minutes and threw him down to fourth position.

At 12 o'clock the race was declared off, those not having completed the course at that time being considered non-finishers. Compared with the German Emperor race on the Taunus circuit, held under the same regulations, the speed of the winning Belgian car is six miles an hour faster than the victorious Fiat. The Taunus circuit was certainly more difficult than the one in Belgium and weather conditions there were not so favorable.

Timed for 100 kilometers, standing start, Hautvast, on a Pipe, gave an average of 66.4 miles an hour. Lee Guinness, on a Minerva, made the two fastest rounds at an average speed of 66.59 miles an hour, Hautvast being a very close second.

In the motorcycle races over two rounds of the Ardennes cir-

BRABAZON, THE MINERVA WINNER, PASSING THROUGH BASTOGNE.

ROBL'S GAGGENAU TAKING ON GASOLINE NEAR GRANDSTAND.

cuit, Contant, on a Werner, was the speediest at an average of 44.3 miles an hour. In the light racer class Bucquet, on a Grifon, finished first at 42.6 miles an hour.

Baron de Caters won the 372-mile open race on a Mercedes in 6:29:10, being an average of 57.5 miles an hour. Lee Guinness on Darracq was 84 seconds behind the winner, Jenatzy (Mercedes) a poor third, and De Laminne fourth. The two British eight-cylinder Weigels did not officially finish. The machines, which had all figured in the Grand Prix—with the exception of the De Laminne—made a poor impression. They consumed more gasoline and were much slower than in the French race, their speed not being equal to that of the German Emperor rule racers of the previous day. Jenatzy, who had gripped valve stems and a broken frame, finished through sheer tenacity; Guinness was beaten in sight of the finishing post.

### THAT CALIFORNIA VANDERBILT COURSE.

In its current issue, *Pacific Motoring*, published in Los Angeles, Cal., seems somewhat skeptical concerning the convenient availability of California for the Vanderbilt Cup race. It comments:

Some of the Los Angeles dealers still contend that the great American Derby can be run on roads near to Los Angeles. Of course, with our great hotel accommodations and conveniences for handling tourists, gently and otherwise, it would be very nice to have some good roads handy by. But, alas, the good roads will not materialize near to this great city, and we must go a hundred miles away to find eald good roads.

As already stated in these columns, Kern county has the good roads needed for a great automobile race, and these nature made roads are fast, smooth and roomy, besides having little or no dust on them. If such a thing was possible, as the moving of the Vanderbilt Cup race from the Atlantic Coast to California, no better road could be found than across the plains north of Bakersfield. Here is one stretch of 32 miles from Bakersfield suburbs to Delano, like one great billiard table, while to the south of Bakersfield, on the great Tejon Rancho, 16 miles and miles of this natural road on the mesa—road that is dustless, hard, smooth, and, of course, very fast.

But aside from the mesa roads, California offers the great dry lakes of the desert, which are beyond compare for a big race course. One at Rosamond, near the Kern county line, and near the main railroad from the north to the south, 16 eight miles long and nearly as wide and perfectly level and smooth, while to the northeast and almost adjoining is a still larger dry lake. As to the question of caring for the spectators, a large city near by is not necessary in California, where climate means so much. Tents by the hundred can be obtained quickly and an automobile camp established, while jackass rabbits are so plentiful out there on the desert that none among all the auto horde need go hungry.

### MR. VANDERBILT TO THE A. C. OF FRANCE.

In commemoration of the three Vanderbilt races won by France, three handsome bas-reliefs, designed and executed by Tiffany, have been presented to the Automobile Club of France in the name of W. K. Vanderbilt, Jr. Chairman Jefferson de Mont Thompson, who had charge of the presentation, sent the following letter to the president of the French club:

Monsieur le Baron von Zuylen.

President Automobile Club of France.

I have the honor to inform you that, as Chairman of the Racing Board of the American Automobile Association, and of the Vanderbilt Cup Commission, I am entrusted to present to the Automobile Club of France, in the name of W. K. Vanderbilt, Jr., three bas-reliefs in bronze commemorating the three Vanderbilt races won by France, namely, the first race won on October 8, 1904, by Heath, on a Panhard-Levassor; the second race won on October 14, 1905, by Hemery, on a Darracq, and the third on October 6, 1906, won by Wagner, on a Darracq.

Yours faithfully,

JEFFERSON DE MONT THOMPSON.

### SECOND BROOKLANDS MEET FALLS FLAT.

LONDON, July 27.—There was a thinning of the ranks of the public at the second Brooklands automobile track meeting, and but meager sporting interest for those who did attend. Of the six races one was a hopeless failure, and three others were but a procession of cars around the course. Tom Thornycroft, on a Thornycroft, won the \$1,000 Manx stakes for 29.331 miles on a gallon of gasoline, his rivals, Vinot and Gladiator, not finishing for lack of fuel. S. F. Edge, on a Napier, captured the Surrey stakes of \$250, and the Century stakes of \$500 were carried off by Newton driving one of Edge's Napiers, Huntley Walker, on a Darracq, being a close second. In a race between an Ariel-Simplex and a White steamer, the American car was defeated by the blowing out of a safety valve half a mile from home. The only excitement of the day was the burning of an Aries and the jumping of the bank by Huntley Walker's Darracq.

### Edge Issues Challenge for a Team Race at Brooklands.

At the third meet S. F. Edge won the international plate, a Dietrich being second and Thornycroft third. Edge has issued a challenge for \$5,000 to race a team of six Napiers against a team of any other make having equal cylinder capacity. Three races are proposed at distances of 300, 200 and 100 miles to be decided on the Brooklands track some time this month.

CLOSE RUNNING AT BROOKLANDS TRACK BETWEEN NEWTON ON NAPIER AND HUNTLEY WALKER ON DARRACQ.

## SOME COMMONER CAUSES OF TROUBLE

By CHARLES B. HAYWARD.

NEITHER men nor machines fall seriously ill frequently; the ills of life, both human and mechanical, are usually things of comparatively small moment, though they may appear large at the time. The bit of a sick headache or the touch of nausea that makes a man regard the ordinary routine of life as something to which he is utterly oblivious and has no care to enter, have their counterparts in the small derangements to which any intricate assemblage of mechanical devices, such as constitute the automobile, must ever be heir to, and they likewise cause a cessation of the usual order of things—generally by bringing the car to a halt. Exception may be taken to this characterization of the automobile by those who have had its extreme simplicity constantly dinned into their ears for the past few years, and there is no intention here to attempt to undermine such an impression. The automobile, as it stands to-day, is a marvel of simplicity; it probably has fewer parts for the number of functions its power plant and transmission are called upon to perform than any equivalent piece of machinery, if such there be; but the fact that these functions are necessarily numerous cannot be overlooked, and the number of parts needed to perform them satisfactorily must be correspondingly so.

### What Goes Wrong in the Carbureter?

The amateur driver who would familiarize himself with every part of his machine, to an extent where he will know its every whim and be able to diagnose its every ailment without unnecessary search or delay, must bear this in mind: It will be the small troubles that will vex him most, and in practically ninety-nine cases out of a hundred it will be nothing more than comparatively trivial defections that he must exercise his ingenuity on. Knowledge is an excellent thing, but knowing how to repair and assemble a gear-set or rear-axle unit will not prove much aid in locating the will-o'-the-wisp of a little defect that causes the motor to run jerkily or lose power.

Neither the change-speed gear-set nor the rear-axle driving unit go wrong very often, and when they do it is usually a case requiring the attention of a more skilled doctor, with the facilities of a good establishment at his back, than for amateur tinkering. But a motor may run well one hour and show infallible signs of illness the next, without anything very serious having happened in the interim. It is quite certain that it will be ignition or fuel trouble, by the latter of which is meant a defection of any part concerned in the production or introduction of the fuel into the cylinder. The gasoline feed pipe may be partially obstructed, or the jet of the carbureter may be suffering from a similar ailment; the float may have become punctured and have filled, thus flooding the carbureter and making too rich a mixture. Again, pounding over rough roads may have had the same result by shaking the screw of the needle valve loose; the spindle of the float may have become bent and caused erratic working of the valve governing the fuel supply, so that the latter has become intermittent; or, in systems utilizing this form of feed, the pressure may have fallen to an extent where a continuous supply is impossible. Last, but far from least by any means, is that prolific source of puzzlement—the auxiliary air inlet, which alone is frequently responsible for many an hour spent by the roadside. Its refusal to operate as it should will cause the motor to slow down and lose power on opening the throttle, when the reverse action should follow, and the fact that it yields readily to a push of the finger makes the true cause difficult to unearth.

### There Is No End of These Little Things.

These are not all the carbureter troubles that can possibly happen, though they do, with the numerous modifications brought about by differing circumstances, come pretty near representing the sum total of small ills that afflict this important essential of

the motor. The carbureter may act indifferently because the needle valve has been tinkered with so much that it is no longer a good fit and the spray cannot be regulated; or, on the other hand, it may have been ground in so often on the assumption that this was the case that the result in the end is the same. It may not be getting sufficient warm air, or it may be getting too much—in one case the mixture will be too rich and in the other too thin, and the trouble may not be one that it is possible to overcome entirely by a change of adjustment. An attempt to explain every one of the ills to which the carbureter could possibly be subject would require a volume, and much of it would make uninteresting reading, as many of the ailments would be rare diseases.

### The Most Vulnerable Points of the Ignition.

In treating of the common, every-day troubles of the automobile motor it has usually been customary to give the ignition precedence as a source of minor afflictions, but with the advances made toward providing a high factor of reliability on this extremely important essential of the motor it can hardly be said that there is much to choose between it and the problem of a proper fuel supply. Here the small thing becomes of even greater importance, and the difficulty of locating the defection is usually proportionate to its diminutive size. Naturally, but unfortunately, nevertheless, the ignition system is heir to a number of small ills. Take the high-tension type employing accumulators, as it is the most generally used on American cars to-day, and the best method of making some approximation to a catalogue of its faults and those before which it is most prone to give way is to divide it into its elements. First of all, there is the battery or source of current supply, next comes the timer, and next in the order stated the coils and spark plugs.

A battery of any kind is necessarily a thing of limited duration—its life is short; but it may be prolonged by proper treatment, and, like many other things, it is not always defunct when it gives every appearance of being so. It must be admitted that the battery has had to bear the brunt of many an accusation that should rightly have been directed at some other part, and, when the dry cell was in more general use, many a good set that had weeks of active service in them have been left to repose by the wayside. The chief battery trouble to be guarded against is short circuiting, and to prevent it nothing else should be permitted to occupy the battery box, as the accidental dropping across its terminals of a screwdriver or other piece of metal spells ruin to either a set of dry cells or accumulators, and particularly the latter. In the case of the accumulator there is, of course, a whole list of ills, most of them petty, that need a whole chapter for their proper treatment. They have been reviewed so frequently that it is unnecessary to detail them again here, except to remark that they do not often happen when the accumulator is well taken care of, and when they do the patient should receive the attention of the manufacturer rather than of the amateur driver.

### Each Element Plays an Individual Part.

Excessive current consumption is a so-called battery trouble for which the latter is invariably blamed, but it is, of course, really an ailment of the coil, and should be treated under that head. The step next to the battery is the timer, and it is a prolific source of vexation that is not suspected in more than a fraction of the cases in which it is at fault. But it will be self-evident that any interruption here is the practical equivalent of no battery, and the latter is frequently blamed for the defection or a search made in the opposite direction. Probably the now common practise of running the timer in grease has something to do with the failure to trace faults in the ignition system to this source as often as might be the case. Those whose experience dates back to the early days will doubtless vividly recall what a nightmare

this part of the motor's mechanism constituted to the driver. Poor contact sums up in a word the chief ill of the timer, and as the contact must of necessity be a moving one, the reasons for its occasional failure will be apparent. And of these a weakening of the springs is probably the most common, to which may be added dirt and the giving way of the fastening holding the moving member of the timer on its shaft. When the latter is only partial or has been marked by a slight shifting of the position of the moving member on its shaft and their resumed connection, there are few things more difficult to locate by anything other than a thorough examination of this part.

#### Inherent Defects Are Now Very Rare.

Next to the timer come the coils, and, fortunately, the chief source of ailment here—the trembler—has undergone vast improvement. Present-day coil troubles are not marked half so much by failure of the trembler as by faulty adjustment of the latter, which causes an excessive current consumption and limited battery existence. The tremblers should all be carefully adjusted with the aid of a special ammeter while the motor is working, and then locked in place. If this be done and care taken to see that the relation is maintained there will be little or no trouble from pitted contact points. Poor and half-broken connections must also be guarded against here, and the same, of course, is true to an even greater extent in the case of the battery. Short-circuiting due to moisture is probably about the only other trouble that happens to a coil, short of its burning out by an ill-advised application of excessive current.

The ills to which spark plugs are subject are almost too well known to require detailed mention, and may be summed up briefly as short-circuiting and breaking, and the same is true of the connections forming intermediaries between these various essentials of the ignition system; but, as is the case with the other parts of the latter, a great deal of attention has been lavished on the production of high-proof insulation, as well as upon adequate protection for the wiring and proper connecting terminals, so that as a whole the wiring gives extremely little trouble.

These, in short, are by far the great majority of the commoner troubles that afflict the carbureter and the ignition system, when the latter is of the high-tension order using coils and batteries.

#### Some Faults of Magneto Ignition.

Contrary to all popular notions on the part of those poorly informed regarding the magneto, the defection of the latter is about as rare an occurrence as the breaking down of the motor itself, by which is meant something wrong with its vital components, such as a broken camshaft or the like. Piston rings wear and so do bearings, besides which there are numerous other small things that can go wrong, but there is seldom anything serious. This is the case of the magneto in a nutshell, except that there are very few small parts involved. Nothing could be simpler than the low-tension alternating generator used with the make-and-break type of ignition. It represents a close approach to the ideal where immunity from breakdown is concerned and practically its only source of trouble is in the contact breaker, which, by reason of wear or the introduction of dirt, may fail to perform satisfactorily. A periodical inspection will avert such an occurrence on the road and it is nothing unusual for a low-tension magneto to run thousands of miles without ever being looked at.

Except for the fact that the problem is slightly complicated by the introduction of the secondary side of the system, and all that entails the high-tension magneto in its present advanced state of improvement differs but very little on the score of reliability from its far simpler rival. Here, again, the only wearing parts are contact points, and with a little attention to the matter of cleaning and oiling while in the garage, there will seldom, if ever, be any necessity for halting by the roadside to make the tour of inspection that should have been done at home. These are all small matters of the class that the philosopher must have had in mind when he coined that terse but expressive saying about the stitch in time.

## A BRAZING FLUX FOR CAST IRON.

It is always annoying to have parts break, whether they are big or little, but I know of nothing more exasperating than to break some small cast-iron piece, the importance of which is away out of proportion to its intrinsic value, says Ethan Viall in *The American Machinist*.

How often has a man spent hours fussing and fuming, trying to patch up a broken casting, when some way to mend it similar to soldering, but stronger, would have saved much time and trouble. Indeed, in some cases, soldering has been resorted to where strength was not required, but as a usual thing a stronger joint was needed and so attempts were made year after year to find a flux that would enable us to braze cast iron. Many a man has had his heart come up into his mouth upon finding, that after repeated attempts, he had actually brazed a piece and the brass had flowed beautifully, but alas, just as he was about to shout "Eureka!" he discovered that the casting was malleable and not cast iron.

The brazing of cast iron had been attempted without success so often, that it was looked upon by most mechanics as being in the same class with soldering aluminum or hardening copper. And it was not until five or six years ago that it was successfully done. A German was, I believe, one of the first to do this, and he obtained a patent on his method, which consisted mainly in coating the joint with a mixture which was principally oxide of copper and borax boiled together, and then brazing with a flux containing carbonate of soda, boric acid and salt. To use this one had to purchase the mixture of certain parties and also have a shop license. The cost was not only prohibitive, but the method insisted upon was clumsy and troublesome. I was one of the first to use this method, under a license, and quite by accident discovered another flux, far better, and entirely different, which could be used exactly as one would use borax in ordinary brazing. I had for years at odd times tried different chemicals alone and in combination, but without success, when a chance remark dropped by a friend of mine, an expert chemist, regarding the properties of common chlorate of potash, furnished me with the hint I needed. After several weeks of experimenting, I evolved the following formula, which is not patented and can be used by anyone who cares to try it, and which I have used for over four years and which has been used by several of my friends. If a similar formula has ever been given I have never heard of it, and this one is entirely my own. The proportions were obtained by careful experiment.

The ingredients may be obtained at any drug store.

The formula is: Boric acid, 1 pound; pulverized chlorate of potash, 4 ounces; carbonate of iron, 3 ounces. They should be mixed together dry and will look like powdered brick dust. The amount specified should cost about fifty cents and when used should be mixed with grain spelter.

After arranging my pieces to be brazed, I heat them to a nice brazing heat and apply my flux and spelter with an iron rod, flattened on the end to a rough spoon shape, just as if I were brazing a bicycle frame in the usual way. The chlorate of potash must be pulverized, but the iron may be what is known as either carbonate or subcarbonate. The mixture should be kept dry, as moisture or long exposure to the air renders it less efficient.

In arranging the pieces for brazing I either lightly clamp them together or use stiff fire clay to hold them in place, but anyone who has done ordinary brazing will readily find a way to fix the pieces. The size of the pieces which can be handled successfully is limited by the heating facilities. A gas or gasoline forge is best, my preference being for the gas. A coal forge may be used, however, though it is not so convenient and when it is used coke or charcoal should be burned, as coal does not make a clean fire. When properly brazed a casting cannot be broken again in the same piece—something that cannot always be said of other methods of repairing which are far from being as easily executed as is the operation just described.

## FOR THE AMATEUR OWNER WHO DRIVES

By THE MAN AT THE WHEEL.

BY dint of personal application it is probable that the average person can learn almost anything he makes up his mind to master—a fact which the average amateur owner soon comes to realize while his first extremely hazy notions as to the intricacies of the automobile fade into thin air at the same time. But there are two distinct classes of A. O's; those who are everlastingly tinkering; in fact, those who take as much, if not more, pleasure tinkering with their cars than they do in employing them for more legitimate ends, and those who go to the opposite extreme by not giving the mechanism any attention at all. It may be thought that the latter constitutes a rare and seldom to be met with class, but such is not the case. There is many an owner to-day who can handle the wheel to the great admiration of his friends and who does not leave stripped pinions behind on every occasion of shifting the gear lever, but who is down and out, to take advantage of the vernacular, the moment there is anything wrong. Needless to add, it is not to this class that these hints are directed. Things mechanical are a profound mystery to many an otherwise well-versed individual whose lack of interest in the subject robs him of any incentive to make himself familiar with his car.

### Well-groomed Cars Seldom Default.

It is the charity that begins at home that minimizes work while on the road, and if a car is properly taken care of when it should be, which is between its periods of running, there will be scant occasion to interrupt the latter in order to make adjustments or repairs that should have been attended to at home. Given the equivalent of the mechanism of an automobile in the hands of a trained engineer every hour in the day, and its owners would require him to prepare a carefully made out report as to its condition during the entire time it was under his charge, every defection, every cause of stoppage and every repair made would have to be noted, as well as the amount of lubricating oil and fuel it consumed. By comparing these daily reports the owner of such a machine could tell whether it were operating as economically and as efficiently three years after it was installed as it was when first set in operation.

It may be too much to expect of the average amateur owner who prefers to drive his own car to add a burden of clerical labor to his caretaking, but the hint is one that may be availed of to considerable advantage. For instance, a crankcase should be cleaned out at stated intervals and the oil replenished and the same is true of both the gear-set casing and the differential and bevel drive. Nine out of ten drivers could not tell you when this was done last, and while the proper period may not have elapsed, the chances are in favor of it having been considerably exceeded. Cases have come to light where progressive owners have, at the expense of a dollar or so, installed a good-sized blackboard on the wall of their garages, using it to note such data as that just referred to. When a man who has his own best interests at heart sees "Fresh Oil in Gear Case, 3-1-07" staring him in the face week after week, it is safe to say he is far more apt to remember that a change is necessary than if he depended on his own memory.

### Serious Expenses May Be Avoided.

It is safe to say that every amateur owner who drives his own car from preference is anxious to avoid those *denouements* that make a heavy draught on the pocket and the absence of the car from its accustomed service. Serious accidents are rare, of course, but they do happen, and if in his regular rounds in looking after small matters the amateur also takes the trouble to keep an observant eye out for the things that lead to serious trouble, the latter may frequently be avoided at a nominal expense for preventives rather than a substantial bill for

the remedy. One fault of many low-priced American cars is an inherent weakness of the rear-axle unit. Not that they are very poorly designed or very poorly built by any means; mounted on skids the mechanism would transmit the full power output of the motor without trouble until it actually wore out, and if all roads were level, by which is meant well-paved, probably the same thing could be said of its service on the car. But every now and again there is the sudden and unexpected meeting with a road gulley or water break into which the rear wheels drop with an ominous thud. Add to this the more or less frequent pounding over car tracks and similar obstructions and it will be realized that the most destructive agency is not the transmission of the power in its wear on the moving parts, but the hammering to which they are subjected. This tends to loosen the nuts of strut and torsion rods, and once the strain on these important stays is relieved disalignment of the rear axle components speedily follows. Of course, this advice would be properly included under the generic head of "keep all bolts and nuts on the car tight by frequent inspection," but there are many of these fittings the temporary loss of which is not attended by grave consequences, although they should naturally be replaced without delay. On the parts in question, their absence is almost certain to lead to one of those discouragingly large repair bills which every amateur driver is so anxious to avoid so they may profitably be made the subject of special attention.

Instances are not wanting where the loss of what would appear to be a most trivial part has been the sole moving cause of one of those sieges at the repair shop, the expense of which proves so discouraging to the autoist who has to count the cost. The cotter dropped off the nut which held one of the bolts of a double-yoke universal situated just back of the gear box on a shaft-driven car; later the nut came off—so much later that an inspection at any time within a fortnight would have prevented the trouble. But it was not made and the forward end of the propeller shaft dropped, caught in the road and played havoc with things generally.

### Some Ancient Admonitions Revived.

There has been so much said on the subject of the proper care of tires that it would seem to be worse than carrying coals to Newcastle to attempt to go further into the subject, especially when it is the intention to cover the same ground. Doubtless American tire manufacturers have had sufficient literature printed on this subject to supply every man, woman and child in the country with at least one copy. Yet there are hundreds of owners who cannot see the wisdom of having all their tire troubles at home. That is, all that are not absolutely unavoidable, and the mere fact that a puncture happens twenty miles from home does not put it in this class, for probably if the tire to which it occurred had been properly inflated before leaving the rubber destroyer might not have been able to make its way through the tread.

Look at your tires frequently, keep your eyes on them as much as possible, and by so doing you will be able to do most of your tire work at home. I know from personal experience that if tires were carefully looked over every morning before a car was taken out, the percentage of punctures would be considerably reduced, and to demonstrate this to a skeptical friend I took him with me to make a round of a dozen or more cars drawn up at a railway station. From one we took a horse-shoe nail and from another a good-sized chunk of glass. In either case the closing chapter was only a matter of a short time, for both objects were so situated that the continued pounding on the road would send them through the tread. "Oh, that's nothing," one driver remarked. "We are picking those things up all the time."

## GLEANINGS FROM EUROPEAN AUTO PRESS

A CRY of mockery has gone up from certain British journals as the result of the defeat of France in her own long-distance road race. Georges Prade, the versatile editor of *Les Sports*, does not appreciate the joyfully compassionate "Poor France" of a certain London journal and hits back vigorously as follows:

It is a lie that we received Nazzaro coldly. We have won enough races, thank God, to be able to lose one. We also lost, once, the Gordon Bennett Cup in Ireland. I won't speak of the manner in which it was gained in 1902 by S. F. Edge's Napier. Everybody is aware—and the English delegate himself—that the Napier won by a violation of the rules, being pulled out of a bad position by peasants. We have a light heart. We salute Nazzaro as a victor. There were twenty-four French cars at the start; there were twelve at the finish—just 50 per cent. There were fourteen foreign cars at the same starting line; there were four at the finish—not even 30 per cent. That ought to satisfy you Englishmen, lovers of regularity and good order. You will tell me that there was no English machine among them. That is true. Your national industry was never in the game: eighteenth and thirty-sixth on the first round, twenty-eighth and thirty-second on the second round, twenty-fifth and thirty-second on the third round; one of your machines went out on the fourth round and the other, your champion, passed twenty-ninth and disappeared on the fifth round. We should be heartless and insensible to all good taste if we did not say, "Poor England; what a wreck!" Supposing the race had been run as a team test, giving each car the number of points represented by its position at the finish, and the non-finishers the maximum number 38, under such a system the 24 French cars would have received a total of 552 points, or 23 per car. The 14 foreign machines would have received 420 points, or an average of 30 points per car, placing them 7 places behind us. This is the reason why we do not accept your "Poor France."

### Parisian Authorities Converted to Tarred Roads.

With the increase of public automobile services throughout the country, says *Omnia*, a serious road problem comes up for settlement. Certain roads in Paris, with their increased loads, are no longer able to stand the heavy traffic. The allowance of material for their upkeep is no longer sufficient, in view of the increased speed and volume of automobile traffic. On certain roads largely used by fast automobiles, says the report to the Department of Public Works, a remade surface only lasts a third of its former time. The Government allowance for roads has diminished successively from 1890 to 1905 from thirty millions and a half to twenty-nine millions. It was only in 1906 that the credit was again brought up to 30,000,000 francs by a special allotment in view of the extra work of road repair men. Some twenty years ago certain provincial engineers and modest road surveyors sprinkled gas tar on the roads, with excellent results, considered extravagant by the authorities. It needed a large amount of perseverance on the part of humble gas tar to overcome the official inertia of Parisian engineers. The tarred road through the Bois de Vincennes was a horrible bog, and the Versailles and Saint-Cyr roads no better, they declared. To-day that has changed and Parisian authorities are busy with the tar brush. The Avenue du Bois de Boulogne has received a good coat of tar—too good, in our opinion; the Champs-Elysees will not escape and the Place de la Concorde will undergo the same treatment. In the report to the Chamber it is stated that the authorities should declare frankly for tarring the road or sections of roads, even in the open country, where there is a big automobile service. Acting on this, the Minister of Public Works has appointed a commission to study the question. As it requires four years to make a test of this nature, we should have to wait a

long time had not more enlightened spirits been at work for the past twelve years, perfecting systems which may be used by the authorities for the whole of the paved streets of Paris. In the provinces they know how to tar the roads without leaving them an ugly black tint, merely by sprinkling a little white sand on the surface before it finally dries. We should have preferred to see this color for the Avenue du Bois de Boulogne in preference to the sad official tint.

### Shall Oxygen Be Allowed on Brooklands Race Track?

Since England obtained its automobile speed track it has been pestered with the question, "Shall oxygen be used?" Opinion is divided, as is shown by the shoals of letters daily falling on the editorial tables. The editor of the *Motor* expresses himself on the "problem" as follows:

Oxygen has occasionally been used for hill-climbs, but since the first Brooklands race meeting it has come very much to the front, the possibilities of its use having been then practically demonstrated. Without doubt, engine power can be increased by the use of this gas. Literally, petrol is simply a gas in liquid form, and it seems quite logical to use with it any other gas that can be obtained in convenient form. Oxygen is a commercial product in everyday use, and there is no more difficulty in obtaining it than in obtaining petrol. If oxygen could not be obtained by the general public, if it were a special preparation about which little was known, and only obtainable, perhaps, at a prohibitive price, by few people in the trade, it would not be unreasonable to raise an outcry against its use in competitions. The important fact for the motoring public to be well acquainted with in connection with the matter is that certain risks have to be taken. These are the risks of damaging the engine, injuring oneself, or (what is more serious) of injuring someone else. If, say, a serious explosion occurred on a competitor's car and several spectators were badly injured, it is conceivable that public opinion would be against its further use. But it is absurd to contend that the use of oxygen is not legitimate. It might even be that the development of the internal-combustion motor could be advanced by an increase in the proportion of oxygen already used in carburation, and it would, therefore, be a pity to prevent its use under racing conditions—the very conditions which are admitted to have done so much for the development of the motor car. If, however, it can be scientifically proved that the use of additional oxygen is no advantage, or has serious objections, then it would be wise, on the score of general safety, to prohibit its use. But, if oxygen in the engine is barred, someone will start using light gases in tires, and someone else will object, and nothing but Weybridge air will be permitted to be used. And thus there will be no end to the squabbling, but one of the chief uses for racing will be gone.

### Competition Gives Cheap Automobile Cab Fares to Parisians.

It is not true, says *Le Poids Lourds*, that there are as many taximeter tariffs at Paris as there are cabs. Nor is it correct that the cost of travel in all cabs is the same. As a matter of fact, there are exactly seventeen methods of valuing the price to be paid to cabby for a given trip. As all these tariffs are inferior to the official scale, the authorities have not, up to the present, thought it necessary to interfere. Now the Prefect of Police has decided on uniformity and has appointed a commission to consider its realization.

M. F. Mieville, of Chichester, is not persona grata with the police of the district, says the *Automotor Journal*, and they have openly threatened to trap him if they can, as he has shown considerable activity in warning others. Whenever he reaches the trap he and his chauffeur get out and push the car through.

## LETTERS INTERESTING AND INSTRUCTIVE

### How Can Water-cooled Brakes Be Fitted?

Editor THE AUTOMOBILE:

[848.]—In one of the accounts of the recent A. A. A. Tour which appeared in "The Automobile," I noticed a reference to the fact that not one of the cars carried such a thing as a water-cooled brake in distinction to European cars, and that on this account many of the competitors suffered from brake troubles while traversing that section of the route that lay through the mountainous part of Pennsylvania. Brakes overheated in frequent instances, and in some cases quite badly, while many of the cars had to halt on the way down some of the worst hills in order to give their brakes a chance to cool. The writer of the account that I refer to made mention of the fact that many European cars could have gone down far worse hills at a much higher rate of speed and without any particular trouble owing to their being equipped with water-cooled brakes. I have never seen such a brake on a car in this country, and would like to know if any American cars are built with them; also in what way do they differ from the ordinary type with which we are familiar from their almost universal use on cars made in this country

Allegheny, Pa.

BRAKES.

So far as is known no American cars have ever been built with water-cooled brakes, though there are certainly a sufficient number of localities in this country that would seem to require them. Owing to the uniformly excellent surface of Continental roads, automobilists abroad are accustomed to run down hills at a rate of speed which is utterly out of the question here owing to the poor roads and numerous sharp turns that characterize most of our hill road building. But even were the latter not the case it would not be wise to run an American car down hill at the same rate of speed as is possible with a foreign car, as the provision of braking surface on the latter is usually far more liberal than designers allow here, in addition to the fact that water cooling is also provided.

While to the uninitiated a water-cooled brake may, from its very title, appear to involve considerable complication, this is far from being the case. It is customary to place a water-cooled brake on the countershaft of a side-chain driven car, this type still predominating to a large extent in Europe, though some makers have also applied them to the rear wheel brakes. They consist of the usual type of external contracting brake, the drum of which is generally made of unusually liberal dimensions from an American standpoint. The inner periphery of this drum is provided with a flange about 1-2 or 3-4-inch high, while the drum itself is entirely open to the air. A small supply of water is carried in a tank located wherever convenient on the chassis so the water may be fed by gravity, and a small bore tube, seldom exceeding 1-8-inch in diameter, is led to a point where the stream from it will discharge on this inner face of the drum already described. The flange prevents the escape of the water at the sides, while the centrifugal action set up by the revolution of the drum carries the water around every part of it in a thin sheet. On a bad hill the amount of heat generated is usually sufficient to evaporate the water about as fast as it is fed. Control is either by a separate pedal or by means of an auxiliary pedal attached to the regular operating pedal connected with this brake.

However, it would be unnecessary to install an entirely new system in order to apply water cooling to the average American car of to-day. The enclosing cases now generally employed on the rear wheel drums—the type most commonly employed here for both the running and emergency brakes—could be drilled with a small hole and tapped for the reception of the water-carrying tube, or a nipple on which to screw a union connection. These holes should be drilled on the inner face of the drums and a lead taken to each from a water tank which would not need to hold more than a gallon or two. We should think such a provision would be found of considerable value where a car is constantly used in a mountainous locality.

### Opinion Wanted on Overhead Valve Gearing.

Editor THE AUTOMOBILE:

[849.]—I have noticed that there is more or less of a tendency on the part of American manufacturers, not only to come around to the practice of placing the valves in the cylinder heads, which I consider the only proper method of design and years in advance of the outboard port type, but also to elevate the camshaft to the cylinder heads. I think there are now several instances of this kind extant among American cars, and I would like to know if you consider this an improvement of equally great importance as that of eliminating the extended valve-pockets.

Los Angeles, Cal.

VALVES AND CAMS.

No such sweeping comparison of the practice of operating the valves by means of tappets and push rods, as is generally employed, and that of using a superimposed camshaft, may be justly made, owing to the fact that designs differ and efficiency is not always a mere matter of adherence to a certain type. The end to be achieved in placing the camshaft in a superimposed position on the tops of the cylinders is primarily that of simplicity, and insofar as when properly designed this type does tend to greatly lessen the number of small parts, as well as to render the entire valve gear very accessible, it may be considered as the superior of the current type. However, this is largely a matter for personal opinion to decide, and the latter is, in turn, strongly influenced by the fact that the average designer finds himself constrained to turn out what the public wants and not what he thinks is ideal or fundamentally correct from an engineering point of view. The superimposed camshaft has much to recommend it, but it probably also has its disadvantages as well as other forms of construction.

### Apparently a Question of Carbureter Adjustment.

Editor THE AUTOMOBILE:

[850.]—As one of the subscribers of "The Automobile," I beg to ask you for information in regard to the car I am running, which is a 30-35 Simplex.

1.—It boils the water until it becomes very hot on high gear as well as on the low gear; everything in the circulation is clean and the pump works all right; circulation is perfect as well as spark perfect and exhaust and timing O. K.

2.—It will not climb hills on third or fourth gear without knocking, and if I retard the spark I seem to lose the power and have to go into second speed. I have made everything tight and have good compression and no misfiring and adjusted the carbureter so that the gasoline level is even with the top of the jet. I have tried making the hole larger and smaller and more and less air, but did not get satisfaction. It pulls very well on level but has not much speed to it. And when the car is not running and I throttle the engine down, it does not fire regularly. I know it has not the speed on hills it should have, as a 30-horsepower Packard can pass me on a hill easy.

Now, I want to know if I was to make the jet longer, so that the gas level would be about 1-16 of an inch below the top with the same size hole, or if I should make the hole larger owing to the higher jet, if it would give me more power. (The carbureter does not flood.) Or what would be the proper level for it on rough roads and hills so that it would develop the actual horsepower and take hills on high gear. The knock produced on hills does not seem like a loose bolt, but a sharp knock same as produced from an overheated engine after the switch is thrown off. I have double ignition and both are perfect, as well as the lubrication.

SIMPLEX.

Greenwich, Conn.

While from your description of the ailments your car has been laboring under, one would be led to judge that something serious was at fault, we think that proper investigation will show quite the contrary to be the case. To tell the truth, it would look as if the matter were merely another instance of "carbureter tinkering," no disparagement of the good intentions of the tinkerer being inferred from that. In all probability the carbureter got out of adjustment and the man in charge of the car, not succeeding in restoring it, set to work to change it according to his own ideas of what should be done. This,

unfortunately, is a more or less common practice and it usually has disastrous results, as the trouble goes from bad to worse until finally the entire car is condemned as worthless.

In the first place altering the size of the hole in the gasoline nozzle was a fatal mistake. If you had stopped to consider the matter before attempting any such questionable improvements you could hardly have failed to come to the conclusion that the size of that orifice was not a matter of guesswork with the makers, but had been determined by calculation and experiment and its correctness verified by actual experience, not with one, but with a large number of cars. As already mentioned, we think the events leading up to the present state of affairs have been such that you are now in a hopeless tangle and would not counsel making any of the alterations mentioned, such as lengthening the jet or changing the level in the float chamber. You have evidently been running the car with a very rich mixture, which would account for the overheating and the latter probably accounts for the knock mentioned as well. The Mercedes type of carbureter with which these cars are equipped is a very simple affair, but like many other things that are so extremely simple it takes one who is perfectly familiar with it to know how to adjust it properly. We should think that even a superficial examination of the jet of such a carbureter would have shown you what an amount of care had been lavished on it to make the nozzle opening accurate to a very small fraction of an inch and that this would have acted as a deterrent to such a radical change as altering this vital part of the device. As you are located within an hour's drive of the city, we should recommend submitting the car to the attention of Mr. Franquist at the factory and have no doubt that a little personal attention on his part will be sufficient to restore things to their normal condition and at a merely nominal expense. We have gone to an unusual length in answering your letter, as the case is one that comes to light so frequently—in fact, it is safe to say that ill-advised tinkering, with the carbureter in particular, has been the means of condemning more than one otherwise good car.

#### Continued Firing After Cutting Off Current.

Editor THE AUTOMOBILE:

[851.]—Being a subscriber, I take the liberty of asking for a little information. I have a four-cylinder car and a few days ago when out for a ride I concluded to stop and shut off my engine for a few moments, so, after stopping the car, I opened the throttle and pulled out the plug but the engine kept on going forward without losing a stroke and continued to do so for a few minutes, when I closed the throttle and it ceased. The engine had been working beautifully and continued to when I started up again and I had cleaned the cylinders before I started in the morning, which, together with the fact that it ran forward and not backward (without losing a stroke) put the carbon theory out of my mind.

By solving this problem you will confer a favor on me and probably others as well.  
G. A. SIMMONS.  
Oakland, Cal.

There is little doubt but that the cause of the continued running of the engine lay in a particle of carbon in the cylinder that became incandescent. By "cleaning the cylinders," as expressed in your letter, we take it that you mean kerosene or gasoline was injected into them, or, at most, the piston heads were scraped through the valve openings. In either case the entire amount of carbon in the cylinders was not alone not removed, but some was taken away and some left and the latter was then in a more prominent position than it had been previously. That is, instead of being a smooth, uniform coating of carbon which does not readily become incandescent, it was divided into points, furrows or ridges, and injecting kerosene or gasoline might have had this effect the same as scraping, as it is well known that the deposit is hard in places and soft in others—or, to put it better, not so firmly attached.

The fact that the engine continued to run forward instead of backfiring and coming to a stop, as is usual in cases of pre-ignition due to this cause, does not necessarily refute the carbon

theory as you surmise. The incandescent portions may have been so located that the fresh charge did not reach them until compression was practically completed, as in close proximity to the exhaust valve, for instance; or, the pieces of carbon may not have been sufficiently hot at the moment the fresh charge entered the cylinder to ignite it, but at the end of the compression stroke its temperature may have raised sufficiently to do so. There are many things concerning the action going on inside the cylinder, about which many of the best versed engineers are still in the dark, and a thorough scientific investigation of these phenomena would constitute a valuable addition to the data now extant. The almost inconceivable rapidity with which operations follow one another inside the cylinder without conflicting is only coming to be realized as the result of the success of the high-speed automobile motor.

#### Non-residents Exempt in Nova Scotia.

Editor THE AUTOMOBILE:

[852.]—In the issue of July 18 of "The Automobile," under the head of Letters Interesting and Instructive, I note that you state in part, in your reply to inquiry No. 823, regarding the conditions under which a car can be taken into Canada temporarily, "It is also necessary to take out a local license."

So far as Nova Scotia is concerned, your reply is in error, as the enclosed copy of the Provincial law will show, and I am also inclined to think that the other provinces extend the same courtesy; I am sure New Brunswick does. I refer you to Section 9 of the law, which is as follows:

"(9) The provisions of this section shall not apply to motor vehicles owned by non-residents of this province, provided the owners thereof have complied with any law requiring the registration of owners of motor vehicles in force in the state or province of their residence, and the registration number, showing the initial of such state or province, shall be affixed to such vehicles, substantially as in this section provided."

Wolfville, N. S.

B. W. M.

We are pleased to note your correction with regard to the eastern provinces in the matter of extending this courtesy to tourists, as while the matter of taking out a local license is a small one and the expense usually nominal, the annoyance attendant upon the process has doubtless proved more than sufficient to deter many tourists from extending their trips over the border. But while the reciprocal courtesy is extended by Nova Scotia and New Brunswick, as you state, we feel quite certain this is not the case with Ontario and Quebec, and it was concerning these provinces that our inquiry was directed. Due to its proximity to the most populous sections of this country, the Province of Ontario is the one into which American tourists most frequently desire entry with their cars and there the requirements are as stated in our issue of July 25, letter number 838, viz.—a nominal bond for the customs, fee \$5, and the regular license fee \$4, besides markers, etc.

Section 6 of the Quebec Motor Vehicle Law is a reciprocal provision exempting "the owner of a motor vehicle who resides in any other Province of Canada," which clearly brings tourists from the other side of the border within the purview of its remaining provisions. Hence the two most important Provinces of Canada require a license and registration regardless of how short the stay of the tourist may be. However, unless the law is not enforced in this respect, the same thing is true of a Canadian tourist bringing his car into this country, so that there is scant cause for complaint on either side.

Doubtless in the course of time the automobile traffic between the two countries will become so great that the necessity of doing away with the regulations now in force will be imperative and there certainly appears to be little reason at the present why this should not be the case. However, the Canadian Provinces which require compliance with their own laws despite the conformity of the entrant's credentials with the laws of his domicile, are no exception, as we have one or two shining examples of it right at home in the States of New Jersey and Pennsylvania, and forcibly illustrates the need of a national registry law.

AS the result of its recent reorganization with a capital of \$200,000 and the acquirement of a complete plant at South Bend, Ind., the Tincher Motor Car Company has sprung into activity, so that instead of manufacturing a very limited number of cars, as has been its custom for the past five or six years, the Tincher is to be a factor in the American market for 1908. In many respects the car will remain unaltered, while in others novel features will be introduced, and though there are quite a number of the latter, the salient characteristics of the car are those that have always been identified with Tincher design and construction since its very inception.

CONSTRUCTIONAL DETAILS OF MOTOR.

In brief, the new Tincher is a 50-60-horsepower car equipped with 5 by 6-inch four-cylinder motor, band clutch, four-speed selective sliding gear, side chain drive, 127-inch wheel-base, standard tread, 36-inch wheels and tips the scales at 3,000 pounds. This weight has been attained by the liberal use of chrome-nickel steel, much of which is imported from Krupp, as well as the use of drop forgings wherever consistent with good engineering practice. The motor is distinguished by the use of rather an ingenious overhead type of camshaft driven through bevel gearing and a vertical shaft at the front, and having but a single cam for the operation of each set of inlet and exhaust valves which are oppositely disposed in the cylinder heads. Duplicate ignition is provided, one set consisting of a standard, self-contained, high-tension magneto of foreign make, which is forward of and across the front end of the motor. Chrome-nickel steel is employed in the crankshaft and camshaft, while the motor valves are a thirty-five per cent. composition of nickel steel; the former material is also used

VALVE-OPERATING MECHANISM.

in the front and rear axles, gear set shafts, pinions and springs, as well as the main frame, which is further reinforced by filling the side channel members with ash strips of the latter extending from the forward end of the motor to the first cross brace supporting the gear-set. A peculiarity of this frame is the use of a manganese bronze casting across the forward end as an independent radiator support.

Other unusual features are to be found in the front axle, which is minus the usual spring seats. Instead the axle is drilled transversely at the places ordinarily occupied by the spring seats, and the single clip which suffices to hold the spring down upon a removable seating fitted on the axle is passed through. This form of construction is also followed in the rear axle, the latter also being distinguished by a 1 1-2 degree arch between the points of spring attachment, this serving to give the driving wheels an equivalent amount of outward inclination from the vertical, thus tending to prevent side slip. This axle is also dropped 2 1-2 inches immediately inside the hub bearings.

GEAR-SET AND DIFFERENTIAL.

In addition to the points of difference already mentioned in connection with the motor, there is another that is exclusive on the Tincher and has to do with the carbureter. At first sight this does not appear to depart from the conventional, but a closer view reveals four short tubes extending downward on the intake side. These open into the combustion chamber at one end and communicate with the carbureter at the other through a 1-8-inch tube to which each pair is connected in multiple. At the top of these tubes is a spark plug and at the bottom a ball check valve. This by-pass system, for such it is, is intended to supply the motor with sufficient mixture to run it idle, and it comes into full play when the throttle in the manifold, through which the main supply of fuel passes, is shut off. When the car is under way this supplementary system is not shut off, but only a fraction of the supply goes through it. It may be closed altogether or opened to the air to vary the mixture. The lubrication is taken care of by a belt-driven McCord force-feed oiler, having four independent leads.

## WORK OF THE LEGISLATIVE BOARD OF THE A. A. A.

AS was made evident by its report, submitted by Chairman Charles Thaddeus Terry at a recent meeting of the A. A. A. Executive Committee, held at the association's headquarters, 437 Fifth avenue, New York City, this board is one of the most valuable adjuncts of the national association. In the course of his report Chairman Terry told of the work on the board in these words:

The Legislative Board has kept in touch, through its chairman, with the legislative situations in the various States, to whose legislatures statutes relating to automobiles or the use of the highways were presented at their last sessions. While the general trend of legislation, as gathered from the data collected by the chairman of the committee, seems to be in the direction of reasonableness and a somewhat larger degree of fairness than heretofore, and to show somewhat of abatement of the unreasoning hostility to the automobile and its use because of their novelty, it is to be regretted that automobile legislation is even yet of so diverse and divergent a nature throughout the several States as to indicate an imperative demand for one of two things, to wit: either (a) the speedy enactment of a Federal law covering the field as far as may be; or (b) the enactment throughout the States of a uniform automobile State law framed upon the model of the best of the present State laws, with improvements thereon if possible.

The Board is prosecuting its work along both of these lines and seeking the earnest co-operation of the individual members of the board to those ends. It will be remembered that the Board prepared and introduced in Congress at its last session a bill providing for the Federal registration of automobiles, and that it is the intention of the Board to press that bill to passage if possible at the coming session of Congress.

This Board, after an examination of the authorities bearing upon the question of the constitutionality of such a statute, and after satisfying itself of the feasibility and constitutionality of such an act, drafted this bill, took it to Washington and had it introduced in Congress. It was referred by the Speaker of the House of Representatives to the Committee on the Judiciary.

In reference to a uniform State motor vehicle law, the Board asks that a copy of the draft of the uniform State motor vehicle law in its final and approved form be sent to each member with the request that each such member of the Board, in case the legislative situation in his State is such as to make it feasible, have the bill introduced into the Legislature of his State, and use his energetic efforts to secure its passage and signature by the Governor of his State.

The limits of such a report as this are too narrow to admit of the recitation of even a digest of the changes in automobile statutes throughout the country during the recent sessions of the legislatures. Such a digest may be prepared later and submitted for the use of the members of this association.

## "IN A FEW YEARS WE WON'T NEED SUCH STRICT AUTO LAWS"

HEREWITH is a communication sent to the editor of the Auburn, Ind., *Republican*, telling how one man changed his mind about the automobile. The story is told in a homely sort of style, but is typical of the experience of probably many another one who lives in the country:

Editor REPUBLICAN:

I had a visit from my old friend Smith last week and he certainly did me good on the auto question—but that's ahead of my story. Last Friday about noon I was washing up for dinner when Honk! Honk! and a great, big, red auto comes right up in my side yard. I yells to my wife, "Mol, get me the gun," 'cause I had promised myself to shoot the first one that came near my horses. I had met one or two with the bay mare and she wasn't so bad, but I just knew the others would tear up the ranch. Well, Mol couldn't find the gun (guess I'd left it in the barn) and in the meantime I discovered Smith was running the thing.

Now Smith was an old, old friend, but I was hot and called him down plenty. He took it pretty well, made a pass with his left hand and the red thing was still as a mouse. Then he climbed down; come over and as we shook hands said: "If you give your old pal a square meal, I'll tell you a story about my horses." Motoring, thinks I, what's that? Well, we went in and when things were going good I says "Well, George, what about your gol-dinged motoring?" I wouldn't admit it then but I was getting kind of curious; who wouldn't with a big, red one outside the window right under your nose? Looked nice, too—for an auto—big, soft cushions and lots of room for your feet.

"Well, I'll tell you," says Smith. "You know I always had horses and down home we have worse places to meet autos than in this country; so for a long time I cursed the machines, same as you do. I never had any trouble though (me either, I admitted to myself), and one day, as I started to nail up the front fence, down the road

come a big machine. Now the kids was playing in the road, where they had no business to be, and they got scared and one falls right under the wheels; but the driver was game, runs the machine right in the ditch, jumps out and picks up the kid. Well I tell you that changed my mind some, 'cause people told me that those automobile fellows would run you down and never stop. Well, I thanked him, and when he wanted to go he found that in running in the ditch he had busted a tire. I was sorry and helped him all I could, he, meanwhile, telling lots of things. Next time I went to town I brought out a can of gasoline and it was not long before I had use for it, about two days I think, when some one comes up and I sees it is the driver who saved the kid. He was out of gasoline and wanted me to drive to town for some. "I'll go you one better," says I, and got him the can. He poured it all in the machine and says, "How much?" I says, "Take me and the missus to the top of the hill and back and we'll call it square." "Take the kids, too," says he, and we did. Well, I got interested. That was two years ago. Now I've got a machine and am more interested and I don't have any trouble with horses when their drivers do half what's right."

"Well, Smith," says I, "I'll admit you have as much right on the road as I—" "There you're wrong," says he. "I don't, the law limits the machine in every way, but I don't kick. It won't always be that way. In a few years we won't need such strict automobile laws, but we may need some for the horse drivers who block the road unnecessarily. Come we'll take a little spin."

Take a little spin! Say, we took what Smith called a little spin; went up to Auburn then down to Sacramento and back and I tell you motoring is all right. It was an eye-opener for me. Instead of continual trouble with horses we had none; instead of continual trouble with the machine we had none. I changed my mind and when I get some dough saved up, it's "motoring" for me.

A SUBSCRIBER.

## GOOD ROADS AND GOOD WILL OF FARMERS

EVERETT, WASH., Aug. 2.—The Snohomish County Good Roads Association has been organized. This is largely an automobile organization. The following officers were elected: President, Dr. W. C. Cox, Everett; vice-presidents, E. M. Stephens, Monroe; William Hulbert, Everett; W. C. Brokaw, Edmonds; secretary, Elmer E. Johnston, Everett; treasurer, W. G. Swallow, Everett. The initial effort of the association was to assist in the entertainment of the State Press Association, and the editors were taken about for a spin to various points of interest.

The association intends to take an active part in the betterment of everything in the good roads lines, and hopes to cement

a spirit of friendship between the auto class and farmers. It will urge its members to give proper regard to the rights of the farmer and to do everything possible to save him from annoyance and danger in the fear which his horses may have of motor vehicles. The association also went on record as favoring a State law to license all auto drivers and owners, with penalties for the violation of regulations.

Good roads building in Washington State has been receiving an increased amount of attention in the past year and more, and it is not improbable that there will be other county associations formed similar to the one just organized here.

PANHARD-TELLIER ON HER WAY DOWN THE SEINE, FORTY MILES FROM PARIS.

TROUVILLE, FRANCE, July 28.—*Panhard-Tellier* has won the Paris-to-the-Sea race, so successfully revived this year by the Navigation Syndicate after a season of languishing health. Apart from accident, it was a foregone conclusion that Tellier's boat, engined by Panhard-Levassor, would repeat her victories at Monaco, and no one is surprised at the result of this run to the sea. With its numerous locks and its miles of serpentine stream, it was recognized as impossible to hold a through race from Paris to Havre. The committee, therefore, which boldly undertook to atone for the 1905 farce, when one solitary boat covered the distance in isolated dignity, organized a race at Paris for the Paris cup, and a second speed test from Rouen to Trouville, with stages at Caudebec and Havre. The portion of the journey from the Parisian suburb of Suresnes to Rouen was a cruising event for all classes of boats.

Five racers took the start—namely, *Panhard-Levassor* and *La Rapière II*, both with Panhard engines. *Lorraine-Dietrich*, *Itala H*, owned by Henry Fournier, and the *Mercedes*, engined by the German firm but with hull built by Pitre. Twenty-one boats made up the cruiser class; there were three hydroplanes and two were classified as seagoing vedettes.

Some disorder marked the start of the race from the Auteuil Viaduct owing to the presence of a large fleet of pleasure boats, united to watch the arrival of the winners in a long-distance swimming match. *Panhard-Levassor* proved the winner in the run down stream to Suresnes bridge, her time being 11:20. Her smaller sister, *Rapière II*, came second in 12:6, and *Lorraine-Dietrich* third in 12:9. Owing to the crowded state of the river only the *Panhard-Tellier* made a good start. The *Lorraine-Dietrich*, with three separate Dietrich motors and three propellers, was unable to compete on equitable terms with the Panhard craft, and Perignon, her owner and pilot, issued a challenge for a special race. Henry Fournier made the fastest time in the cruiser class with *Itala II* in 19:10. Mlle. Noilhan's *Panthère*, with Bianchi engine, coming second in 21:22.

Running down stream from Vernon to Elbeuf and from Elbeuf to Rouen was a happy pleasure party, each boat wandering along at the fancy of its crew, tying up for lunch at the picturesque waterside villages abounding in this part of Normandy, or anchoring in a shady place, while every man aboard splashed in the clear depths of the placid Seine.

Starting out from below the busy Cathedral City of Rouen,

seasickness. Both *La Rapière* and the *Panhard-Tellier* broke their own records, the latter boat covering the distance at the rate of 32 miles an hour, in 17:46. *Rapière's* time was but 61 seconds slower, or 18:47. Cruisers generally made fast time, but owing to thinly represented classes little comparison could be made between them.

#### "DIXIE" DEFEATS FAST BRITISH BOAT.

SOUTHAMPTON, August 2.—America's champion motor boat *Dixie* has won the Harmsworth international Championship Cup in Southampton Water against Britain's three best representatives. *Dixie*, who carried her owner, E. J. Schroeder, of the Motor Boat Club of America, and was steered by Capt. Pierce, covered the 35-mile course in 1:15:44 3-5, equal to an average of 27.78 miles an hour. Daimler II, the fastest British boat, was second in 1:17:25 2-5.

Perfect weather conditions prevailed when the start was given, and, although *Dixie* took the lead at once, she was closely followed by *Daimler II*. Before the first leg was covered the American craft began to pull away from her rival, and gradually increased the lead to such an extent that, barring accident, her victory was certain. Without a falter from beginning to end, the *Dixie* finished with a lead of three-quarters of a mile, rousing cheers, the hooting of horns and the dipping of the Union Jack by the entire fleet greeting her as she crossed over the line. *Daimler II* ran well, but never had the same speed as her rival from across the Atlantic.

There is general regret that the French boats *Panhard-Tellier* and *Rapière II* were not able to meet the *Dixie*. The entries of these two boats were made after the official date of closing, and, on their acceptance being referred to the Motor Boat Club of America, that body refused its sanction on the grounds that there had been ample time to enter, and failure to do so was not its fault. *Panhard-Tellier*, which is certainly the fastest motor boat ever built in Europe, has beaten *Daimler II* in every contest. In the 200-kilometer Championship of the Sea at Monaco last April, she traveled at an average of 34.77 miles an hour. *Dixie's* fastest time was in a 15-mile race on Lake Worth, when she averaged 32.51 miles an hour. Owing to the immediate return of the American boat to participate in races on the Hudson, it is not likely that she will meet the crack French boats this season, as had been hoped by motor yachtsmen.

## A COMMON SENSE TALK ON HILL CLIMBING\*

ONE of the great feats which is credited to most every car by its owner is, "She will take any hill, within most any radius, on 'high,'" etc. It is certainly necessary for a car to get over any hill on the road, and it is, no doubt, a pleasure to surmount it on high; but, whether it is advisable to do so is a question answered in some cases immediately by the breaking or straining of one of the parts, or later by the poor condition of all the parts of the mechanism that is an inevitable consequence.

The most important factor in climbing hills fast certainly is in having enough motive power in proportion to the weight of the car. It does not follow, however, that a high powered car should climb hills on the "high" as easily as a light runabout with a good deal less power; first, on account of the difference in weight to be dragged, and mainly on account of the relation of the speed of the motor to the driving wheels. High powered cars are generally geared much higher than cars with smaller motors. This is done so as to be able to run fast on the level without speeding the motor excessively. The average relation of gearing is about three to one of the high on cars having twenty to twenty-five horsepower. In cars of thirty to forty-five horsepower we find the average "high" gear to be about two and one-half to one. Still higher powered cars, say from fifty to sixty horsepower, have a ratio which is often less than two to one, and racing machines are generally geared one to one on high, driving wheels making same speed as the crankshaft.

We speak of these ratios as the average, but there are many high powered cars with lower gear ratios when built for special uses, or when they are air-cooled, etc. When, for example, the ratio three to one is spoken of, it means that the motor shaft turns three times in order to turn the driving wheel once. When figuring the ratio or the speed of the motor when traveling a certain mileage per hour, we must necessarily consider the size of the driving wheels, because when a car mounted on thirty-four-inch drivers has a ratio of three to one, its motor runs slower than one of a car mounted on thirty-two-inch drivers with a three to one gear, both making the same speed. Let us consider what the ratio of gearing has to do with hill climbing abilities of automobiles. The explosions in the cylinders are really pushing the car up the hill. When the motor is allowed to run fast while the car goes slow, the explosions occur often, the flywheel will maintain a uniform speed, and the car will mount easily and without jerking. When, however, the motor turns over slowly, the flywheel not being heavy enough to advance the

car steadily between the intervals of the explosions, the car will jerk at each explosion, and all driving and power transmitting parts will be under a strain for which they were really not designed and are not able to stand very long.

To impress the importance of this subject on your minds, we will figure just how far one explosion in one of the cylinders of a four-cycle, four-cylinder motor geared at two to one ratio, must push a car mounted on thirty-four-inch drivers, and, at the same time, how many revolutions, or at what speed per minute, the motor runs when making sixty miles per hour.

The circumference of a thirty-four-inch wheel being approximately nine feet, it takes about 587 revolutions of the wheel to cover one mile. The motor must then make 1,174 revolutions per minute when running a mile a minute. In this car each cylinder makes one explosion while the crankshaft turns twice, and we get four multiplied by 587, or 2,348 impulses on the motor shaft in one mile, and which figures about two feet and three inches of travel of the car to each explosion. Supposing we negotiate a hill with a 33 1-3 per cent. grade, which means one foot rise in three feet advance. If we ascend it with the car each explosion must push the car with all its weight, and against all the friction, two feet and three inches ahead, and consequently raise it one-third of that distance, which is nine inches. Consider what a tremendous strain there must be on all power transmitting parts, especially when going slowly, for then the flywheel at the speed it turns is not heavy enough to carry the car steadily ahead and upward. Consequently, we believe it to be advisable to climb hills on the lower speeds. In speaking of the ratios of the gears a simple way of easily obtaining them on any car will be of interest. They can be figured, but it requires counting teeth on sprockets or bevel gears, etc., usually enclosed, and always full of grease. Engage the clutch and the gears of which the ratios are to be determined. Mark the driving wheel at its lowest point, and the floor with chalk. Also mark the flywheel so as to be able to count its revolutions. Then push the car, counting the revolutions on the flywheel until the chalk mark on the driving wheel is again at its lowest point. The ratio will be the number of turns of the flywheel to one of the driving wheel. If, for example, the flywheel has turned two and one-quarter times, the ratio is two and one-quarter to one. By measuring the distance between the chalk marks on the floor in feet, and dividing it into 5,280, will give the number of turns the driving wheels make in one mile. Multiplying this quotient by the number of turns made by the flywheel will give the number of revolutions the motor makes in one mile.

\*Read before the Long Island Automobile Club by Louis T. Weiss, Chairman Technical Committee.

## BRITISHERS WILL ENCOURAGE USE OF ALCOHOL FUEL

LONDON, July 24.—After twelve months musing the British Motor Union has pronounced in favor of alcohol as a substitute for gasoline. In view of the increasing cost of the present fuel they recommend that steps be taken to remove the restrictions on alcohol, that a prize be offered for an essay on this fuel, and that trials be held to test the respective merits of alcohol and gasoline. Regarding other possible solutions, the Union recommends that the use of heavier spirit be encouraged, that efforts be made to modify existing restrictions on the use and distribution of alcohol, competitions be held for kerosene carbureters, and that the use of benzene be encouraged. The government tax on alcohol is at present the greatest difficulty in its adoption as an automobile fuel, but is thought that the revenue authorities' objections can be overcome by the use of an efficient, and at the same time inexpensive, denaturant. The point

that is chiefly emphasized in the report is the fact that there are many possible alternative fuels that may be employed satisfactorily, but all of them are subject to the same disadvantage of being limited by natural causes, just as are present-day fuels, such as gasoline. This has caused a hard-and-fast line of classification to be drawn between alcohol, which is the one fuel of absolutely unlimited production, and those which are limited, these again being subdivided according to whether their origin is coal or petroleum. As a means of obtaining immediate relief, the use of slightly heavier fuels, such as the gasoline imported from the East Indies, is recommended, while emphasis is laid on the fact that the boiling point, rather than the specific gravity, should be followed as a standard in judging its fitness for fuel purposes, since the real criterion is one of boiling point or capability of complete evaporation at normal or below normal temperatures.

# EUROPE'S GOOD ROADS RESULT OF SKILL AND LABOR

By Cortlandt Field Bishop, Chairman A.C.A. Map Committee

THERE is a vague impression among American automobilists that Europe's magnificent road system is a glorious heritage handed down from generation to generation and enjoyed by father and son without expenditure of either time or money. There is an enormity of incorrectness in the supposition, for primarily Europe's roads are not all good, and where they have been developed to a stage worthy of the designation perfect it has been by the employment of the highest engineering skill and enormous sacrifices of men and money.

France has won for herself the enviable position of leader in the world's national highways, with a system of roads which far surpasses those of her neighbors and by which, in comparison, the highways of America are a mere scratching on the surface of a continent. Naturally France has profited—and profited largely—by the work of earlier generations. Harking back to the Roman occupation, there were more than thirty thousand kilometers of road in use throughout Gaul, about four thousand of which formed the first four great highways radiating out from Lyons in the Rhone valley to the Rhine and the Meuse valleys, Amiens, Bordeaux and Marseilles.

Under Philippe Auguste a system of arrangement and classification was put into use which, although modified and renamed, has never been changed since the twelfth century. The delightful highway along the right bank of the Loire—known of every American automobilist who has traveled in France—was his special work, while the Route de Bretagne was among his valuable donations to the nation. Louis XI., who created the *Service des Postes*, Louis XII., François I., Henry II., and Charles II. all carried forward the work of improving and extending the national roads. Henry IV., that strange esthetic monarch, passed the law making compulsory the planting of trees by local authorities along the national highways. Colbert, Louis XIVth's most distinguished minister, put up the first mile stone, thus laying the foundation of a system by which in our days all who run can read. Napoleon, engrossed with the military conquest of Europe, found time to attend to the development of the *Grandes Routes Nationales*, thereby leaving a monument of far more durability than his most brilliant military prowess.

### French Nation Pays Liberally for Road Maintenance.

But the work of the present generation is in no way inferior to that done under the old régime, when the peasant did his *corvée* or forced labor on the building and upkeep of highways. Taxation is the modern *corvée*, more equitably distributed over the whole nation; that it is not a light burden is shown by a reference to the official figures of the cost of road maintenance in France for one year. In 1893, according to official reports, the sum of about thirty-two million dollars was expended in the maintenance of the four national systems of highways, namely national roads, departmental roads, communicating paths and country lanes. This large outlay was for road material and labor only; an additional expenditure of from 30 to 50 per cent. must be added for the maintenance of watercourses and sidewalks, the planting of trees and for general administrative expenses. The annual average cost of a kilometer of national road is \$155; departmental roads cost \$120 per kilometer; the humblest country lanes, designated *chemins vicinaux*, are allotted the sum of \$40 per kilometer for their annual upkeep and repair.

HIGHWAY ACROSS THE GREAT ST. BERNARD.

ROAD SKIRTING PRECIPICE IN FRENCH ALPS.

TUNNELED THROUGH SOLID ROCK NEAR AURILLAC.

EASY GRADE MOUNTAIN ROAD IN SAVOY.

To thoroughly appreciate the value of French road building and at the same time enjoy automobiling in its most exhilarating form it is necessary to explore the mountain districts. Mountain climbing in an automobile is not yet overdone—indeed, it is more correctly in a robust infancy. The Massif Central, with its Domes of Auvergne, forms an introduction to the wilder and more precipitous slopes of the Pyrenees and the French Alps. Here, on highways of such uniform excellence that it was possible to hold an international speed test around snow-capped peaks, and where a special speed track would have been created but for the distance from the capital, there is a magnificent region to be used as a preliminary training ground for the automobile lover of mountain scenery.

The Pyrenees, of recent years increasingly popular with automobilists, present examples of road engineering only slightly inferior in skill to those of the French Alps, while for historic interest, the preservation of ancient customs and grandeur of nature they appeal as forcibly to thousands as their better known rivals on the southeastern frontier.

#### Mountain Automobiling Fascinates the Cool Headed.

Alpine automobiling demands two conditions—perfect road surfaces and a car that leaves no room for fear regarding its power to pull or ability of its brakes to hold on any grade. Naturally a cool head and a certain ability as an automobile driver are requisite if a trip through the French Alps is to be enjoyed, for although road conditions are made as safe as it is possible for mountain roads to be and the modern automobile rarely fails, there is always a smack of danger on mountain ledges overhanging yawning precipices. Under the charms of nature, however, the sense of danger in mountain automobiling is transformed into an exhilaration unequalled by any other sport.

It is in the French Alps that the finest examples of engineering skill in road building are to be found. The St. Bernard, started by Napoleon, the Petit St. Bernard, the Galiber Pass, the Lauteret Pass, eight thousand feet above the sea and only open two months in the year, the Liorn, the longest road tunnel in France, are a few of the better known examples of skill in road building, the counterpart of which can only be found in America in some of our most daring pieces of railroad work. As an example of how a steep mountain side is climbed, the winding road near Aix-les-Bains, an illustration of which is given, is an excellent piece of work, the road serpentine up the hill side in a series of easy grades, easily climbed by machines of ordinary power. The highest mountain passes, built primarily for military use and only open to traffic a few months in the year, show an enormous expenditure of skill and labor in carving out a roadway where nature seems to rise up as an insurmountable barrier.

#### SOME EXTREMES THAT ARE MET WITH.

Just to show how far some people will carry a hobby, an instance is recalled of a new owner who made it a custom to take out the spark plugs of his motor and treat them to a careful brushing with gasoline almost as frequently as he lavished the same attention on his teeth—and as he was a careful individual, this was a little more often than the Tennessee mountaineer who was near the three score and ten mark before he saw a man "filing his teeth" for the first time. While such treatment naturally did no harm, it would have been just about as efficacious to have polished the hoofs of a good horse every morning with a view to increasing its speed. There is sufficient necessary work to do about a car without taking the time to put in a lot of useless strokes. It is said that, in the navy, where there are so many men on board a ship, that it is difficult to keep them all busy, work is done by one part of the crew and undone by another in order that a third section may do it over again. The man who takes care of his own car, whether from a desire to economize or from a liking for the work, has no surplus time in which to follow such a round-about way of doing things.

#### THE CHAUFFEUR'S DREAM.

By A. D. HARD, M.D., MARSHALL, MINN.

The stillness of a Summer night;  
Soft zephyrs cool, the moon's pale light,  
Combined to soothe in sweet repose,  
A weary Chauffeur, and his woes,  
At close of day.  
A long day's run, his muscles sore,  
Reclining on the garage floor,  
To catch a moment's fitful sleep,  
Forget his aches in slumber deep,  
Begrimed he lay.

Sweet dreams: Unfettered flights of mind,  
In which we thrust hard facts behind,  
And soar in fancy, far and fast,  
Or own the earth, and spurn the past—  
'Till sleep doth break.  
And thus the Chauffeur, as he lay,  
In restful peace at close of day,  
Was led by Dream-King's fairy hand,  
Down where the Sea doth kiss the land,  
His wish to make.

He wished that from Utopia far,  
Would come for him a perfect car.  
Free from all troubles on the road,  
That add to life a weary load,  
And pleasures dim.  
The Dream-King bowed; And off the strand,  
Appeared a ship from foreign land.  
Upon her deck in bright array,  
The Chauffeur's ideal auto lay,  
Consigned to him.

A limousine, its fittings fine;  
Each graceful curve and beauty line  
Bespoke the perfect master's art,  
To charm the eye with every part—  
It was "A dream."  
The wheels were shod with gauzy air;  
Pneumatics, but no rubber there.  
No fear of blow-outs, cuts and leaks,  
No gum-elastic fills, or freaks  
That perfect seem.

The motor was a "Mighty Six,"  
As silent as the River Styx:  
No valves, no gears, no wearing parts;  
The triumph of mechanic arts—  
Perfection kissed.  
Ignition! 'Twas a gleam of joy,  
Bereft of all that might annoy.  
The spark, along its wireless track,  
Sped swiftly to each plug and back,  
And never missed.

And lubrication! Oh, how fine:  
For dirty oil "Dark Afric's" mine  
Had given man a secret rare,  
And liquid-graphite, clean as air,  
Made smooth each part.  
No pump, nor syphon, fin or fan,  
To curse with trouble mortal man:  
The Chemist, delving science deep,  
Had solved the cooling problem, cheap,  
A simple art.

Thus, one by one each trouble past,  
The perfect car appeared, at last,  
To charm the Chauffeur's longing heart;  
With poetry of motion's art—  
But, 'twas a dream.  
The wind-slammed door the Chauffeur woke,  
He gazed around, but no word spoke.  
His dirty, crippled, ungroomed car,  
Stood as it stopped, from journey far.  
THIS was "no dream."

The Autodrome Commission of the Imperial A. C. of Germany is at present studying the plans of a piece of land, situated near Aix-la-Chapelle, which has been taken into consideration for the proposed motor track. The convenient position of the Aix as one of the most frequented points in Continental railway traffic is one of the most weighty reasons brought forward by the supporters of a course in the Eifel district.

## From Peking To Paris

CROSSING THE SEVEN HUNDRED MILES OF DREARY WASTE KNOWN AS THE DESERT OF GOBI.

PARIS, Aug. 1.—Paul Pons, who started as a Peking-Paris tourist with the small caravan which turned its back on the eastern city a couple of months ago, has returned to Paris with bitterness in his heart. Pons mounted a Contal tricar, a robust little machine very ingeniously fitted up for the hard work across wild wastes, which, after a few hundred miles, found itself too heavily loaded in proportion to its horsepower, and had to withdraw. Reports which came in from the party declared that the Contal had been relieved of a large part of its load, but as it was still unable to continue as rapidly as the others, it was finally left behind. Pons swears that the other drivers broke their promise to keep all together, and when he was in difficulties left him behind and made no attempt to find him. He trailed along in their wake until his gasoline supply was exhausted; then, having neither food nor water, he was obliged to abandon his machine and make for Kalgan, 180 miles away, partly on foot and partly by occasional lifts from camel caravans. When the main party reaches Paris Pons declares he will be there and will express his opinion without reserve.

Prince Borghèse, who has a machine of much greater power than any of his competitors—a 40-horsepower Itala, with runabout body—has left the De Dions and Spyker, has pushed ahead, is now at Berlin, and will reach Paris this week. Cormier, the De Dion driver, has telegraphed to Paris that the Italian car has left the route mapped out by *Le Matin*, organizer of the tour, and is pushing on over the district the driver considers most suitable. Replying to this protest, the organizers declare that the road is absolutely free in the Peking-Paris run, and that if a competitor wishes to leave the marked-out course, with its gasoline stations, he is at liberty to do so at his own risks. The performance is not a race but a tour, the only advantage to be gained by first arrival being that of additional publicity.

Latest reports from the two

De Dions piloted by Cormier and Collignon are to the effect that they have reached Petropawlowsk, and should be in Paris ten days later than the Itala, their mileage at that time being about four thousand, leaving only two thousand miles to be covered over daily improving roads. Daily journeys at this stage of the tour average 100 to 150 miles, according to the condition of the country. As the Ural mountains are approached traveling again becomes difficult, but none of the hardships encountered in China or on the dreary wastes of the Gobi desert are met with.

The Spyker, the only Dutch car which entered the test, is still under repairs at Tomsk, in Siberia. When his magneto has been put into working order it is the intention of Godard, the driver, to return to Tchermkovo, the point where he boarded the Trans-Siberian railroad, and continue the journey under his own power, as stipulated in the rules governing the tour.

All the cars taking part in the 6,000-mile transcontinental run are stock chassis with special fittings for the herculean task they have undertaken; Itala has 40 horsepower, the two De Dions are 16-20, and the Spyker is registered as a 24-horsepower model. The French and the Dutch cars have open touring body crowded with the necessary equipment for camping out, carrying extra supplies of gasoline, tires and oil. With its runabout body, having a large rear platform available for big capacity gasoline tank and reserve tires, the Itala has had a distinct advantage over its rivals, its load in proportion to horsepower being very low compared with the others.

Critics have tried to belittle the tour on the ground that liberal aid has been given by camel teams and groups of natives. While it is true that in many places the heavily loaded automobiles had to be helped out by external means, especially in the undeveloped districts of Asia, reports from tourists with the party, and particulars furnished by Pons, show that the drivers are en-

CHINESE TROOPS GUARDING CARS AND TRAVELERS.

titled to all honor for their plucky performance, and that the automobiles have proved themselves capable of passing over every class of country, with or without roads.

### FATAL ACCIDENTS STOP FRENCH CRITERIUM.

PARIS, Aug. 3.—As the result of two automobile accidents resulting in the loss of six lives, the Minister of the Interior has telegraphed to the Prefect of the Gironde ordering him to stop the Criterium of France tour organized by the A. C. F.

On the third stage of the journey, Bordeaux to Nantes, to be covered at an average speed of twenty-one miles an hour, car No. 34, a Martin & Lethimonnier, manned by Sergessmann and Perrett, and carrying two Parisian press photographers, Meurice and Lequin, broke down and smashed into a tree. Lequin was killed and the others slightly injured.

A little later, and only a short time after the first accident, one of the competing cars and a touring car containing Bordeaux newspaper men on their way to inquire about the first disaster, came into violent collision and were reduced to wreckage. Mathieu and Metayer, driver and mechanic of the competing car, were killed on the spot. The two men in charge of the touring car died before reaching hospital, and one of the newspaper men expired immediately on admission.

The Minister's interdiction refers only to the Criterium, and not to the Press Cup race to be run on a guarded course near Lisieux. The contest, which was the proposal of the Marquis de Dion, a strong opponent of racing, was to comprise the Criterium, a four-day touring event, on a daily schedule varying from 19 to 25 miles an hour, and a final speed test on a limited supply of fuel, known as the Press Cup. Whether the final race will be run depends on the decision of the A. C. F.

ALONG THE ROAD NEAR THE GREAT CHINESE WALL.

- Nov. 30-Dec. 7...—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., Jal Alai Building, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4...—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.
- Sept. 7.....—Minneapolis, Minn., State Fair Race Meet of the Minnesota State Automobile Association.

#### Races, Hill-Climbs, Etc.

- Aug. 9.....—Algonquin, Ill., Hill Climb, Chicago Motor Club and Chicago Automobile Trade Association.
- Aug. 9-10.....—New York City, Brighton Beach Track, 24-hour Automobile Race, United States Motor Racing Association.
- Aug. 17.....—Newark, N. J., Olympic Park, Carnival of the New Jersey Automobile and Motor Club.
- Aug. 31.....—Philadelphia, Race Meet under auspices of the Quaker City Motor Club. (Track will be either Point Breeze or Belmont.)
- Sept. 2.....—Harrisburg, Pa., Race Meet of Motor Club of Harrisburg (probably Middletown track).
- Sept. 2.....—Chicago, Harlem Track, Race Meet under the auspices of the Chicago Automobile Club.
- Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

#### Motor Boat Races.

- Aug. 13-15.....—Chippewa Bay, St. Lawrence River, Gold Challenge Cup Race, American Power Boat Ass'n.
- Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.
- Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

### FOREIGN.

#### Shows.

- Sept. 28-Oct. 7...—Denmark, Copenhagen International Automobile Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1...—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France. Applications for space close August 15.
- Jan. 18-Feb. 2...—Turin, Italy, Fifth International Automobile Exposition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, Etc.

- Aug. 23.....—Belgium, Ostend Motor Boat Meeting.
- Aug. 11-29.....—France, Coupe de Auvergne.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.
- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chateau-Thierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gallion Hill Climb.
- Nov. 1-15.....—France, Voiturette Contest near Paris.
- May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.
- July 14, 1908....—Paris to London, Aerial Race.

## THINGS DOING AMONG THE BUSY CLUBS

### New Jersey Endurance Run Winners Receive Prizes.

NEWARK, N. J., August 5.—Contestants who completed with perfect scores the three-day endurance run of the New Jersey Automobile and Motor Club, held May 30-June 1, received their awards last Thursday evening in the shape of a certificate signed by the officials of the contest and a gold watch fob, with the name of the contestant and car neatly engraved on each. The latter was given in the nature of a surprise and was greatly appreciated, as it was not the least expected by either contestant. The committee went a little further in the nature of surprises by presenting each of the contestants who completed the three days' run with an engraved certificate, the only difference being that those awarded to the cars were managed with creditable skill, while the twelve perfect score men are so worded. Each certificate is signed by the committee, which also presented the owner of each official car with one of the gold watch fobs. Those receiving these were W. C. Shanley, George Paddock, Raymond S. Joo, L. T. Wiss, A. H. Whiting and C. F. Boyd. The certificates and fobs for perfect scores went to J. B. Ryall, Matheson touring car; J. W. Mason, Stoddard-Dayton touring car; Richard T. Newton, Stoddard-Dayton runabout; H. J. Koehler, Buick and Corbin runabouts; R. A. Greene, Oldsmobile touring car; Percy H. Johnstone, Grout touring car; F. E. Boland, National touring car; C. H. Peckworth, Knox touring car; C. W. Oathout, Jackson runabout; Charles S. Calvert, Winton touring car, and Henry Setlow, Dragon runabout. The awards were made by Angus Sinclair, president of the club, who reviewed the history of the local organization and the leading part it has taken in New Jersey automobile history.

### Chicago Automobile Club Expands in Its New Home.

CHICAGO, Aug. 5.—At the rate at which the Chicago Automobile Club has grown during the past month, which is the first it has been in occupation of its new quarters, it would look as if the latter would shortly become inadequate, despite the liberal scale on which they were planned. In fact, that the need for room will sooner or later become pressing is already apparent, and with this in mind there will be a revision of the features that are to be installed. For instance, a set of bowling alleys were included in the original plans, but it is doubtful now if they will materialize, the space being added to the grillroom. It is suggested that a swimming pool be installed, though this is but one of the many put forward. As yet the garage facilities of the "inside-the-loop" clubhouse have not yet been tested to their capacity, but the new system of checking adopted has already been responsible for a large increase in the demand. To members the fee for checking for twelve hours or less—that is 7 A.M. to 7 P.M., or over night—is but a quarter, while touring cars are stored at the rate of \$25 a month and runabouts \$15, the schedule of prices for washing and the like being proportionately low.

The latest official club circular gives a list of fifty-two new members, the largest number ever admitted at one time. Charles A. Coey has just resigned as a member of the club's racing board, his reasons being that his position as a competitor in track events made his position as a board member an inconsistent one.

### Nevada's Mining District to Have a Club.

GOLDFIELD, NEV., Aug. 5.—The automobile has been a very important factor in the development of Nevada, and there are now a great many of the machines in constant use. In order to secure improved roads and promote the interests of automobilists generally, Senator T. L. Oddie and Clarence Oddie have raised the sum of \$3,000 for the purpose of organizing an automobile club, which will be known as the Southern Nevada Automobile Association. Active steps are being taken and the club will shortly be in full swing.

### Harrisburgers Arranging for a Labor Day Race Meet.

HARRISBURG, PA., August 5.—Enthusiasm is rampant in this city for a race meet on Labor Day, and the Motor Club of Harrisburg is taking active steps to have the event take place. From the present indications it will be impossible to hold the races on either the Eshenour or the track above the city on the river road, but the scene of activities will shift to the famous Middletown Fair Grounds. During the past few days the talk has centered on the Middletown track, as it is easy of access, contains a grandstand and, the most important point, is in good condition. Autoists who are interested in the pending races think the Middletown track, if it can be secured, will be the real thing, and plans will be made next week to secure the track and make arrangements for the races.

Should the meet be arranged it is likely that the challenge race between H. B. Stillman of Philadelphia, in his Pennsylvania car, and James A. Kline, of York, in his Pullman, would take place. This race is to be for a side purse of \$100, which will be turned over to charity. A Wayne car may also be entered in the race.

### Quaker City Motor Club to Hold Meet.

PHILADELPHIA, August 5.—At last week's meeting the Quaker City Motor Club decided to continue its aggressive campaign and promote a monster meet, to be held either on the Point Breeze or Belmont track. Saturday, August 31, was selected, and an effort will be made to bring together all the fastest cars in the country in a trio of events at 25, 50 and 100 miles. There will also be several short-distance races and one for "gentlemen drivers"—that is to say, a strictly amateur event in which owners shall drive their own cars. There is a division of opinion in the minds of the contest committee as to whether Point Breeze or Belmont would furnish the better sport. The former, although more easily reached and therefore more suitable from the "big gate" viewpoint, is handicapped by too-sharp turns and a bad surface. Belmont track, located in the suburbs, has poor transportation facilities, but is wider, a regular oval in shape, and with very easy turns. Both are mile tracks.

### Brockton Autoists Protest Against the New Law.

BROCKTON, MASS., August 5.—The Brockton Automobile Club held a meeting last week and entered a vigorous protest against the new Massachusetts law regarding registration, which went into effect August 1 and requires the payment of an additional fee of \$5 for re-registration. The meeting was the largest one held in a year, and President G. W. R. Hill, in his address, stated that it was time for the 20,000 owners of automobiles in this State to see that their interests were looked after in the future. The club voted to request the Massachusetts State Automobile Association, with which the club is affiliated, to test the constitutionality of the law. It was voted that all members paying the new registration fee do so under protest.

### The Automobile at the Grand Forks County Fair.

GRAND FORKS, N. D., Aug. 5.—That the automobile is entering more and more into the life of the agricultural community is evident from the action taken by the Grand Forks Automobile Club in making arrangements for the cars which will bring visitors to the county fair. Just as the horses have their hitching-posts and watering-troughs, the cars are to have a special parking space, and that a number are expected is apparent from the fact that a plot 120 by 160 feet has been secured inside the grounds. It will be devoted to the use of automobiles alone, and will be in charge of an attendant, who will take care of the cars during the owners' absence.

**Influence of the Public Demand on Auto Design.** Within the past few years there has grown up what has been aptly termed standard practise in connection with automobile design. But, is it a standard set by the engineering forces of the industry, or one modeled by the man who buys the car. A review of the present status of the American industry and its product tends very strongly to the latter opinion, for, though the designer may have clearly defined ideas of his conception of what the finished car should embody, forces that are constantly at work prove much too strong for him. Nominally, the designer of a car has a free hand concerning its technical creation, but actually he has very little latitude, and his initiative is seldom permitted to go beyond the incorporation of details of his own selection, together with improved methods of construction.

For the rest he must look to the business end for guidance, and it is the car not alone that sells, but that sells without the necessity of making a new convert to its particular system every time one is sold, that the sales department wants. It is not to be inferred from this that all cars of a certain price are alike, though they both form a close approach to a uniform standard of excellence in service, for, given the same materials and tools and the same designs, two factories may turn out a very different product. On the whole, it is hardly necessary to be more than usually discerning to note that, after all, it is the man who buys the car who has been responsible for molding its design along certain lines. In the first instance, a few progressive manufacturers introduced changes of a nature that met with lasting favor. So much so that

other makers found themselves compelled to fall in line in order to place their cars on the same level in a competitive market. And the buyer still continues to want that certain type of machine in ever increasing numbers, from which there has arisen the present uniformity in design that is so noticeable. Probably 80 to 90 per cent. of the American automobiles to-day are the same so far as their essential features are concerned, the remainder embodying some special system. Not that this is to be taken in a derogatory sense nor in favor of those that represent a radically different system, but it illustrates to what an extent public opinion molds the design.

**A Sidelight on the Ever Vital Problem of Ignition.** With the adoption of the custom of providing ignition apparatus in duplicate on such a large number of cars, there has been revived a problem that had only been settled definitely—which, of course, means by general consent—but a short time previous. This is the placing of the spark plug. Extended experience has demonstrated that, for obvious reasons, the best place for this is over the inlet valve. But as two systems of ignition have come to mean two entire sets of equipment that are wholly independent, the question naturally comes to the fore again, for if it is undesirable to have the spark plug anywhere but over the inlet valve, then it follows that both plugs of the two sets should be in that position. Practise up to the present seems to be in favor of locating the second plug either in the center of the cylinder head or over the exhaust valve, and a compromise is effected by making the plug so situated the one called upon solely for starting and emergency use—in short, it is not the running plug

But why not a twin plug? suggests an English autoist. The temperature existing in the vicinity of the exhaust valve is entirely too high for long-continued satisfactory working, and a central location has not been found to give the same satisfactory service as a plug placed over the inlet, due to the cooling effect of the incoming charge of fresh gas, as well as the fact that the plug is always surrounded by the latter at the time of firing. As at present employed, it is necessary to drill and tap independent holes in different places, so that the expedient of combining the plugs in one, which would be equally simple, would be an advantage from the manufacturing point of view and would also permit of concentrating the wiring to better effect.

**Are American Cars Properly Equipped with Brakes?** So much has been done toward the improvement of the American car where its braking system is concerned that it may seem totally uncalled for to ask such a question as that here brought to light. But can it be answered in the affirmative? The experience of the competitors in the recent A. A. A. tour when traversing the only mountainous part of the route, that through the corner of southwestern Pennsylvania, would most certainly appear to warrant an answer in the negative. The descent of several miles of down-grade, even at the speed which the contestants in that event found themselves compelled to adopt, should not prove too much for the brakes of any car properly equipped.

The query of a correspondent, which is printed elsewhere in this issue, as to why American cars are not equipped with water-cooled brakes is apropos at the moment, as no trouble would have been experienced had they been fitted in this manner. This practise is quite prevalent abroad, and it also leads to a further comparison—that of the amount of effective braking surface allowed for cars of a certain weight. Doubtless the fact that roads are so uniformly excellent on the other side, from which has sprung a custom of running down hill at a very much faster rate of speed than would be considered within the limits of safety here, has had much to do with the extremely liberal provision of braking surface that is to be noted on Continental cars. No brakes can be too good for any car, and, as this country is not lacking in mountainous roads to try them to their utmost, it would seem that there is still room for improvement in this important essential.

## NOT TOO EARLY TO DISCUSS NEXT YEAR'S TOUR.

TRUE it is that the 1908 A. A. A. tour is nearly a year away, but, profiting by the experience of the past, it would appear to be the height of wisdom for the Touring Board of the national organization to begin at once the work of preparation. The annual shows come earlier than ever before, and there should be excellent opportunity to have something definite to discuss during the show fortnight from October 24 to November 27. Now that the recent event can be judged more calmly and dispassionately by all participants, it can be seen that it was a distinct advance over the three previous affairs, and it is plainly apparent that it can be greatly improved in various ways.

THE AUTOMOBILE will be pleased to print the opinions of those who are interested enough to offer suggestions regarding what an ideal tour should be to benefit both the user and the maker of automobiles. Out of the many opinions that may be expressed there should be numerous suggestions of value to the Touring Board, which should plan for next year even though its *personnel* might not remain the same. Experience gained in the Cleveland-Chicago-New York run will be of inestimable help in rule-making for the 1908 "Endurance Tour." Please note that the word "endurance" precedes tour.

### What One Maker Thinks of the Recent and Next Tours.

J. D. Maxwell, vice-president of the Maxwell-Briscoe Motor Company, who saw considerable of the recent tour, expresses himself in this manner:

"To my mind the tour just passed was as severe as it is necessary to make it. The public do not want a test which is calculated to break machines up. What they do want is a contest which approximates actual touring conditions. One thing is certain, and that is that no private owner would ever subject his car to conditions as those which the Gliddenites experienced.

"One glaring defect has manifested itself in the rules, and this undoubtedly will have to be changed before another tour. According to the conditions, no driver of a car could replace any broken part unless he carried that extra part with him. To show how unfairly this works out, I will cite an example of one of our own cars.

"While running along a bad road a projecting stone carried away the truss rod from the rear axle. The cost of replacing this rod would have been but fifty cents, yet under the conditions of the tour and because we had failed to bring along an extra truss rod it was necessary to run without it. The expected followed—the axle sagged and the car had to be withdrawn.

"Now take for an example another car which breaks, for instance, an engine. According to the terms of the contest both cars had to be withdrawn. One of them could have been fixed up with a fifty-cent repair, while the other repair was out of the question, yet both were penalized the same amount. As a matter of fact, the axle on this car was repaired by installing a new truss rod and the car finished as a non-contestant.

"Such little points as these are hard to foresee and it will probably take the experience gained from one or even two more tours to formulate a set of rules that will be entirely fair to all. Personally, I am a great believer in the Glidden tour. It is a credit to the American automobile industry that as many cars finished as did."

### Some More Statistics of the Tour.

As testified by the official examiners, thirteen cars started in the A. A. A. tour without a single extra part, and two others had provided themselves with nothing more than an extra set of spark plugs. Those believing that their regular equipment was sufficient to carry them over 1,600 miles were: Pierce (5), White steamer (3), Thomas Flyer (2), Royal Tourist (2), Packard, Oldsmobile, and Columbia (1 car each).

It is interesting to note that the best records were made by these machines with no reserve parts in their chests, for no fewer

than ten of them finished with perfect scores. No. 32 Oldsmobile had but three points against it, Pierce No. 21 had 90 penalization, one Royal Tourist continued as a non-contestant, one Pierce overturned, and the Columbia had to withdraw. That 80 per cent. of the cars having no reserve parts—the spark plugs can be ignored—should officially finish such a severe contest with but 93 penalization points among them is a remarkable proof of reliability. The honor roll of perfect scorers—touring and runabout, gasoline and steam—comprises 47.6 per cent. with no reserve parts. This should satisfy the most exacting.

Admirers of steam had reason to be proud of the showing made by their favorites, for all three contesting steamers were among the "no-spare-parts men" and all three figured on the honor roll of perfect scorers. In addition, two steamers started and two finished in the run in the service of the press and of a tire firm.

### Concerning "Entertaining" During the Recent Tour.

With possibly a handful of exceptions, those on this year's tour, while appreciating the proffers of entertainment in several of the night stops along the route, were inclined to seek their own enjoyment. Chicago had been particularly eager to have the chance of extending the glad hand to the tourists, but when the opportunity arrived there was something amiss in the heartiness of the greeting—at least that seemed to be the general impression even by those who were specially looked after as a result of old acquaintanceship. One tourist whose usual attitude, it must be confessed, is somewhat pessimistic, commented in this vein after reading an editorial in *Motor Age*:

"We had a good time at the band concert on the night of our arrival, listening to music that wasn't half bad while we bought our own liquid refreshment. The track races the next day were exciting, but hardly worth the dollar we paid to get inside. In the evening, at the Chicago Automobile Club, we did relish the good cigars which Chairman Hower bought and had distributed. Oh, yes! we could buy something to drink. Sunday I didn't go out to that resort where we could hear some more music and again treat ourselves to thirst quenchers. Why didn't I go? Well, I couldn't find the automobiles which were to serve as substitutes for our own, which, under the rules, were held in cold storage in the First Regiment Armory. That editorial in the Chicago paper about the lack of hospitality after the finish in New York gives me a weary feeling. But, then, I suppose when some people get to a real city they are a bit timid about venturing very far from their hotels. As for myself, I wanted none of the big town's hospitality except what I could find myself—and I found a sufficiency without any great effort."

### Details of the White vs. Stoddard-Dayton Run-off.

BUFFALO, August 5.—The details of the White vs. Stoddard-Dayton run-off of the Hower trophy tie explains how the gasoline car lost to its steam rival.

When the contestants left Syracuse on Wednesday morning, July 31, the Stoddard-Dayton was suffering from a broken spring, which had been repaired as well as possible without penalization. Fifteen miles from Syracuse the weakened spring snapped, but was patched up without new materials and the car hobbled along to regain lost time. At Batavia the car met the firemen's parade and lost its way trying to avoid this "pageant."

H. K. Sheridan, driving the White runabout, arrived a half hour ahead of time and waited at Main and Eagle streets for the Stoddard-Dayton. Minute after minute passed by; then it came to be a matter of seconds. Secretary Lewis waited for the expiration of the two minutes' grace, and then announced the White car as the winner.

When the Stoddard-Dayton did pull up, limply, as it were, E. L. Leinbach said: "A broken spring and that firemen's parade did it." Secretary Lewis immediately wired to New York City for the Hower trophy to be sent to the White factory.

**BEWARE OF AUTO TRAPS IN FREEHOLD, N. J.**

FREEHOLD, N. J., Aug. 5.—The police of Freehold ran four traps Sunday and are running two every day, and intend to keep it up. They are located at the edges of town, on the roads to Lakewood and the shore, to Long Branch, to Trenton and Matawan and to New Brunswick. "Vanie" Perrine is the chief pumpkin and gathered about \$150 of the "graft" yesterday. Business is so brisk that the sugar barrel and the cracker boxes at the cross-roads general store have been abandoned and the whole "force" is collecting tribute along the highway.

**WARNINGS OF TRAPS CLOSE TO ALBANY, N. Y.**

ALBANY, N. Y., Aug. 6.—Albany automobile owners, under the auspices of the Albany Motor Club, have organized a campaign against the auto traps and the rural grafters. A number of signs have been prepared reading "Speed Trap—Albany Auto Club." These are being placed around the roads, wherever the rural constables and justices have set their traps, to warn touring autoists, and a patrol is maintained by the club of stalwart young men on bicycles or in autos or on foot to keep the signs up and to watch the traps and discover every new one they set. That this work may be carried on, subscriptions are being solicited among the local owners and club members, with the result that in the past ten days \$361 have been subscribed.

**STATE ENGINEER TO CONFER WITH ROAD USERS.**

ALBANY, N. Y., Aug. 6.—State Engineer Skene is charged, by an amendment to the Good Roads law enacted this year, with the duty of making rules for the protection of the State's improved highways.

"Early next month," said State Engineer Skene to-day, "I shall endeavor to get together here in Albany in a sort of convention representatives of the automobile associations, the bicyclists, the road drivers' associations, the supervisors and town officials, so that I may meet with and discuss with them what is advisable and feasible and satisfactory, to all who use the highways, in the way of road rules. I am charged with the duty of formulating such rules by the recent amendment to the Good Roads act, and I am desirous of getting all interested persons together and learning from them what would be the best rules to adopt."

The section of the law now known as Chapter 717, Laws of 1907, which gives him the power to make road rules reads thus:

"The State Engineer is hereby further empowered to make such rules as may from time to time be necessary for the protection of any such highway or section thereof, and any disobedience of such rules shall be punishable by a fine of not less than \$10 and not exceeding \$100, to be recovered by the State Engineer for the benefit of such maintenance fund."

**A. M. C. M. A. SECURES LION'S SHARE OF PALACE.**

About eighty-five per cent. of the main floor space of the Grand Central Palace show has been taken by the American Motor Car Manufacturers' Association and will be allotted to members by a drawing the latter part of August.

A further increase in the rapidly growing membership of the A. M. C. M. A. has been made by the incorporation of the Chadwick Engineering Works, of Philadelphia, makers of the "Great Chadwick Six," and of the Pullman Motor Car Company, of Chicago. The association now comprises 46 makers.

**OLDFIELD SAYS PUBLIC WANTS HIPPODROMES.**

DENVER, COL., Aug. 3.—A Denver daily newspaper prints the following: Like Barnum, Barney Oldfield, the dare-devil automobilist who courts death by every turn of the wheel, declares that the (sporting) public likes to be humbugged. In an oratorical outburst Oldfield says that people pine for fake races and hippodrome. Square races are not so spectacular, he avows, and therefore are not so pleasing to the populace. Harken unto Barney the Bold: "I'll admit you can't run a real honest race any more. I found out early in the game that all these affairs must be on the hippodrome order. For instance, early in my career I went against a Frenchman for ten miles, went in to make the best time I could, and beat him a mile. The crowd was sore, and I found out the only kind of a race the grandstands want is one where the racers hang onto each other's heels and see-saw all the way around. The public doesn't know it, but that's the way the racing game is played now. We've got to do it or we couldn't get the crowds."

**SOCIETY OF AUTO ENGINEERS FLOURISHING.**

The Society of Automobile Engineers, at the recent session held at Buffalo, gave convincing evidence of its activity and value to the industry. The society now contains a hundred members, with forty added during the past two months and indications of many more before the annual meeting to be held in New York City during the automobile shows. The condition of the treasury is excellent. These were the papers read at the Buffalo meeting:

"Some Micro-Structural Considerations," by J. M. Ellsworth and T. J. Fay.

"Pointers on the Equipment of a Hardening Room," by Joseph Schaeffers.

"Motor Vehicle Springs," by John G. Rumley.

"Influence of Acids in Lubricating Oils on Bearings," by Henry Hess.

"On Timing Automobile Races," by A. L. McMurtry.

"The Carbureter and Its Functions," by Charles E. Duryea.

During the Buffalo meeting there were inspections of the Pierce and Thomas plants, and a run to Niagara Falls. The papers read were interesting and prompted the usual amount of discussion.

MEMBERS OF THE MECHANICAL BRANCH OF THE ASSOCIATION OF LICENSED AUTOMOBILE MANUFACTURERS LEAVING E. R. THOMAS MOTOR COMPANY'S PLANT, BUFFALO, FOR A RIDE IN THOMAS FLYERS THROUGH THE PARKS OF THAT CITY.

PRIZE-WINNING WHITE IN BOSTON OLD HOME WEEK PARADE.

### HUB AUTOISTS CELEBRATE OLD HOME WEEK.

BOSTON, Aug. 3.—The automobile features of Boston's Old-Home Week took place on Thursday, and consisted of a parade through the downtown streets followed by gymkhana games on the Common. The events were arranged by a committee of members of the Boston Automobile Dealers' Association, and, for the middle of summer, a very good representation of cars in both parade and games was secured. Prizes were offered by the Old-Home Week committee, and the competition was keen. The parade, which started at noon from the Back Bay, was made up of about 150 cars, with President L. R. Speare, of the Bay State Automobile Association, as chief marshal.

The touring car prize went to C. W. Wilson, who entered a Winton, while the runabout prize was taken by Arthur Adams with his Oldsmobile roadster. The trophy for the best appointed car driven by a woman, with women passengers, was won by Mrs. J. A. Davis, of Amesbury, with her White tourer. Competition for the prize for the best decorated car was very close, for there were a number of handsome machines entered. The judges, however, decided that the award should go to Mrs. J. H. MacAlman, wife of the Columbia branch manager, who entered a large Columbia adorned with beautiful floral decorations. Some of the other finely decorated cars were Mrs. J. S. Hathaway's White runabout, Dr. J. F. Hovestadt's Buick runabout and J. M. Thomas's Welch.

Competition for the most grotesque car was between a White, entered by J. S. Hathaway, of the local branch, and a Columbia, entered by J. H. MacAlman. The White car was occupied by three rustics and was equipped with all sorts of crude devices. The Columbia car contained a party of country constables who had captured a chauffeur and had him tied to the back of the car. The prize was eventually awarded to the White.

The gymkhana sports on the Common included six events, and the contests were watched with much interest by a good-sized crowd of Old-Home Week visitors. G. H. Kimball, with a Corbin, was the most successful, winning the old clothes race, slow race on the high gear and the brake test. C. J. Pendleton, with a Carter car, won the twelve-mile-an-hour race; Guy Green, with an Orient, the obstacle race, and Harry Murch, with a Cadillac, the tilting contest. The committees in charge were as follows: Parade—J. H. MacAlman, chairman; L. R. Speare, F. A. Hinchcliffe, J. S. Hathaway and James Fortescue. The gymkhana committee consisted of K. M. Blake, chairman; George W. McNear, George H. Lowe, S. K. Dingle and A. E. Morrison.

### MANY REGISTER IN NEW YORK DURING JULY.

During the month of July 1,586 automobiles were registered at Albany under the New York State law. Ford headed the list of the new arrivals with 217 cars. Cadillac occupied second position with 91 cars, and Maxwell was third with 88.

### RE-REGISTERING UNDER NEW BAY STATE LAW.

BOSTON, August 5.—The new re-registration law in Massachusetts went into effect August 1, and the Highway Commission is literally swamped with the business of re-registering automobiles at \$5 each and motorcycles at \$2 each. Up to the present time the Commission, with a force of a score of extra clerks, has received applications from about one-fifth of the automobile owners, and applications are arriving at the rate of from 600 to 700 a day. About \$16,000 has already been turned into the State in fees.

Some of the automobilists object strongly to the new law and are paying their fees under protest. They claim that the law is unconstitutional, and there is talk of carrying it to a decision before the Supreme Court. The new law is rather rough, particularly on those who bought machines this spring. When they registered their cars in May or June they paid \$2. Now they are called upon to pay \$5, and the first of the year they will have to pay another \$5.

### FRESH COMPLICATION OF PATENT SITUATION.

GRAND RAPIDS, MICH., Aug. 5.—It looks as if the controversy over priority in the invention of the propeller shaft drive for automobiles which was so thoroughly thrashed out on the other side between French and English litigants a few years ago were to have its counterpart in this country. Homer L. Boyle, better known as an author, claims that his patent Number 470,175, covering a shaft drive for a vehicle propelled by a gas-engine, is being infringed by a number of automobile manufacturers and he has instructed his attorney to take up the matter of royalties with the latter. At the time of the granting of the patent the claimant attempted to utilize it in the construction of a vehicle, but found it impossible to procure a sufficiently light motor. The patent still has two years to run.

### AUTOMOBILE ROW DOES NOT OBSERVE SUNDAY.

It has been called to the attention of New York's chief of police, through the medium of sundry complaints, that the supply dealers along the row are not strict observers of the Sunday closing law. Quite the contrary, most of them are breaking the Sabbath and the law as well by dispensing supplies to cars at their doors just as the law-abiding section of the community is on its way to church. Formal complaint has been made and it is probable some action will be taken by the police. It is said that most of the prominent dealers do not open Sundays and are in favor of the enforcement of the law.

GOVERNOR HANLY OF INDIANA AT CHERRYVALE FRESH AIR FARM.

During the State Encampment near Indianapolis, Governor Hanly expressed a desire to visit the "News" Fresh Air Farm at Cherryvale, and was taken thither with his party in two six-cylinder Premier cars. In the picture with the children are Mrs. Hanly, Mrs. Rogers, her guest, the Governor, and R. I. Eads, sales manager of the Premier Motor Mfg. Company.

MODEL C. THE LATEST PRODUCT OF THE NORTHERN.

### NEW NORTHERN RUNABOUT FOR 1908.

One of the first things to strike the familiar observer about the new Northern runabout shown in the accompanying illustration is its utter absence of side levers. At first sight it would appear to conform to the prevailing standard in this respect, but a second look brings this to light. The use of a two-speed planetary gear placed immediately behind the two-cylinder horizontal opposed engine, and which is controlled by the convenient hand lever shown mounted on the steering column, is responsible for this. The power plant is of the standard type that has been specialized by the Northern Motor Car Company for several years past on their light cars, though its rating under the new formula adopted by the Licensed Association of Automobile Manufacturers is 24.2 horsepower instead of 20 horsepower, as formerly claimed by the makers. The cylinder dimensions are 5 1-2-inch bore by 5 1-4-inch stroke. The remaining specifications are the same as the 1907 model C Northern, though the lines of the body have been altered, making it a most attractive looking car, designed to sell at a moderate figure, as it lists at \$1,600.

### BLOMSTROM 1908 MODELS ARE READY.

DETROIT, MICH., August 5.—The 1908 models of the Blomstrom Mfg. Co., Lieb and Wight streets, Detroit, Mich., are out, the chief change over 1907 being the refinement of many details and the increased piston displacement of the motor, the cylinders of which are now made 4 5-8x4 1-2 inches. The output of Blomstrom "30's" for 1908 is already largely under contract to dealers.

GEARLESS CARS IN PROCESS OF CONSTRUCTION.

A peep into the assembling room of the factory of the Gearless Transmission Company, Rochester, N. Y., shows that there is plenty of work in hand. The company reports a rapidly increasing order list.

### BENDIX COMPANY BUYS TRIUMPH PLANT.

CHICAGO, August 3.—The Bendix Company, of Chicago, recently organized and capitalized for \$200,000, last week purchased the factory, machinery, and equipment of the Triumph Motor Car Company, at Cragin station, Chicago, and has taken possession of the plant, establishing executive offices there in connection with the manufacturing end of the business. The officers and executive heads of the company are as follows: President, Vincent Bendix; vice-president, Joseph Hagenbuck; secretary, H. Clay Calhoun; superintendent, O. M. Delaunty; engineer and designer, L. P. Sittig; purchasing agent, Fred Patterson. Mr. Bendix, the president, has had an extended experience in the manufacture and sale of automobiles of the buggy type, which is the type of car the Bendix company is manufacturing, having been connected with the Holsman Automobile Company. Mr. Delaunty, superintendent, was formerly with the Holsman Automobile Company in the same capacity, and was previously connected with the manufacturing departments of other large automobile concerns. The 1908 models have been given exhaustive road tests, and shipments of same will commence September 1. With its new factory facilities the company has arranged for an output of about 1,200 cars for next season.

THE THOMAS OF 1901 AND THE THOMAS OF 1907.

Montague Roberts, the well-known Vanderbilt Cup driver, recently discovered at Lakewood, N. J., the first car ever produced by the Thomas factory, in the early part of 1901. The car, which is shown at the left of the picture with Mr. Roberts at the wheel, is still in running order, and was sold July 6, to a Lakewood resident for \$100.

### HOW KNOX WILL BE REORGANIZED.

SPRINGFIELD, MASS., Aug. 5.—At a meeting of the stockholders of the Knox Automobile Company, in this city, Friday last, the company was formally assigned to a receiver for the benefit of its creditors, as announced by officials of the company a few days ago. It has been authoritatively announced that the plan for an adjustment which will be presented to the creditors within a week or ten days by the receiver, A. N. Mayo, will involve a capitalization of the company's debts, amounting to \$560,000, into 8 per cent. preferred stock, making the total capital stock of the company nearly \$1,000,000.

The plan which will be presented to the creditors is briefly this: The debts of more than half a million dollars will become preferred stock, cumulative at 8 per cent. per annum, and the present stock of the company, valued at \$363,000, will become common stock. The total stock will amount to \$923,000, or nearly treble the old stock. The reason assigned for the company's action, which was voluntary, was under capitalization, and under the new arrangement it is believed that the company will be able to proceed with its profitable business without danger of a recurrence of its present financial embarrassment.

It is also stated authoritatively that the creditors will accept the plan for adjustment as proposed by the receiver.

### ST. LOUIS MOTOR CAR CO. FAILURE.

PEORIA, ILL., August 3.—As the result of a rumor that the St. Louis Motor Car Company at Peoria Heights was disposing of its assets without the consent of its creditors, there was a hurried meeting of some of the largest of the latter, and Saturday morning there was a petition presented to Judge Wright in the United States District Court, praying for the appointment of a receiver. It was granted without opposition and James M. Sholl was duly appointed, giving bonds in the sum of \$20,000. The action which stirred the creditors to life was the shipment to Chicago of a \$3,000 car on Friday and the attempt to send another away the day following, but Jesse French, Jr., in charge of the plant, explained that the cars had been sold and paid for and were simply being delivered.

The total indebtedness of the concern is said to reach \$120,000, while the value of its assets as a going concern will total \$100,000. The petitioning creditors' claims amount to \$64,000, the difference between this sum and the total indebtedness being represented by numerous small accounts, including the pay roll for the past fortnight, amounting to \$2,400.

The creditors who joined in the petition for the appointment of a receiver are as follows: Sholl Bros., \$587.60; National Refining Company, \$554.38; Jesse French, Sr., \$20,000; C. L. French, \$37,000; Olive Street Bank, St. Louis, \$5,500. Jesse French, Sr., is also endorsed to other indebtedness of the concern amounting to \$30,000.

The company has fifty-one automobiles in process of construction for which a ready market can be found at prices ranging from \$2,250 to \$3,000 and has contracts ahead for six months. It is believed that in the hands of the receiver it will be able to pay off all its claims and continue to do a successful business.

### AEROCAR COMPANY MAKES AN ASSIGNMENT.

DETROIT, MICH., Aug. 5.—The Aerocar Company will discontinue, application having been made Saturday last for the appointment of a receiver. It is understood that there have been some differences of opinion among the numerous stockholders, and the capitalization was not sufficient to carry along the organization on the extensive plan attempted by the directors.

### PEUGEOT TOURING CAR WINS PRESS CUP RACE.

TROUVILLE, FRANCE, Aug. 6.—Renaux, driving a Peugeot, won the Press Cup on the Lisieux circuit to-day in 4:36:35, equal to 53.4 miles an hour. Competitors were touring cars having qualified in a four-day endurance test, racing under full touring conditions, with a gasoline allowance limited to one gallon per 14.8 miles. With two thousand troops guarding the course and a perfect organization, the race was one of the best ever held in France. There were no accidents.

THE NEWEST AUTOCAR LOOKS AS THOUGH IT COULD GO SOME

### NEW AUTOCAR MILE-A-MINUTE RUNABOUT.

In bringing out its 35-horsepower mile-a-minute roadster, illustrated by the accompanying photograph, the Autocar Company, Ardmore, Pa., has devoted every effort not alone to embody every possible detail of mechanical improvement appropriate in such a car, but has also paid particular attention to the finish. The latter is a pronounced cerulean-blue, set off with crimson, making a most striking contrast with the quiet hues in which the other cars turned out by this firm are finished, and especially as exemplified by the Autocar's physician's car. The combination in question is the result of considerable study, involving an appreciation of road conditions and wear, as well as the selection of a harmonious color scheme that would at the same time not produce a result wholly lacking in the elements of durability.

### AERONAUTS NOW HAVE MONTHLY ORGAN.

The *American Magazine for Aeronauts*, published at 142 West Sixty-fifth street, New York, is certain to interest the advocates of air traveling. The July number contained some thirty-five pages of text, including technical articles on the aero problem and aeronautical news from various quarters of the globe. The August number, which will be out the coming week, will be even more interesting than the initial issue. Ernest LaRue Jones, the editor, is secretary of the Aero Club of America.

Ballston Spa, N. Y.—West's garage, recently opened here on Front street and Milton avenue, has bestowed Ballston Spa with one of the best automobile centers of this part of the State. The building, which is of brick with litholite trimmings, has a capacity for 100 machines, and is completely fitted up with engine room and current generating plant, machine shop, etc.

PACKARD MOTOR CAR COMPANY FACTORY AS IT STANDS TO-DAY AT DETROIT.—ITS 435,000 SQUARE FEET, INCLUDING THE 160,000 SQUARE FEET OF ADDITIONS, COVERS TEN ACRES.—HERE WILL BE BUILT 1,500 CARS OF THE PACKARD "30" 1908 MODEL.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY.

An addition to the manufacturing supply trade has been made by the organization of the H. & T. Mfg. Co., Inc., at Worcester, Mass., with a capital stock of \$30,000. Frederick B. Early is president and Ralph D. Thayer, secretary and treasurer, both of Worcester.

Much credit is due to Ray McNamara, one of the youngest drivers in the recent A. A. A. tour, who showed his ability by successfully driving the Premier pilot car, Number 98, from Cleveland to New York. It was his car that used only one quart of water between Indianapolis and New York and was the same model as the Premier that came through the strenuous 1,600-mile run with a perfect score.

Work was begun recently on the new testing plant which is being built at the plant of the Reo Motor Car Company's plant at Lansing, Mich. The original brick track with its cinder surfacing is being torn up and will give way to a new one of planks, as the ice proved to be troublesome to the testing drivers on the brick track in winter. The new track will be properly banked at the turns and will permit of greater speed as well as freedom from danger.

According to George W. Coffin, of Denver, Col., he is on a trip that makes the A. A. A. tour look like thirty cents, to use the vernacular, and at the time of writing he was 432 miles west of Denver in his Model M Winton. He says: "I am now on the western slope of the Continental Divide and have crossed four mountain ranges varying from 10,000 to 11,000 feet high, and in 700 miles of the ruggedest travel have not had a bit of trouble, not even a puncture. Mine is the first automobile seen in this section."

At the regular monthly meeting of the board of directors of the Monarch Motor Car Company, Chicago, Ill., held at its offices at Chicago Heights, an addition was made to the official staff. S. M. Paine succeeds J. A. Ward as secretary and treasurer, the former being promoted to the office of vice-president, while T. A. Quinlan, Jr., has been appointed general manager. Rapid progress is being made on the erection of the new machine shop which is under way at Chicago Heights, and the company expects to take possession about September 1.

Turner Brass Works, formerly of Chicago, has completed its new factory at Sycamore, Ill., and is occupying it. The main factory building has a floor space of 40,000 square feet, with power and heating plants additional. Improved machinery has been installed and facilities enlarged and greatly improved. The plant is located on the main line of the Chicago & Great Western Railway and the Galena Division of the Chicago & Northwestern Railway, with sidetracks to the factory. All correspondence and orders should be sent to the main office at Sycamore.

A. E. Schwartz, the foreign representative of the American Motor Car Manufacturers' Association, who has been in Europe for the past eight months, comes back with the statement that next year should be an important one for American automobile manufacturers in the foreign fields. He says there are tremendous

possibilities for the small car trade and that the greatest demand is for cars of from 14 to 24 horsepower. The A. M. C. M. A. representative is also of the opinion that the tenth annual show this fall in Paris will be the biggest in history. American concerns can arrange with him for space before his return, which will be in about four weeks.

Harry Elder, keeper of a tollgate near Baltimore, Md., has secured a large lantern for the purpose of stopping automobilists at night who do not see his toll house and run by. The lantern is of sufficient candlepower to overcome the combined lamps in front of the automobiles, and it is either a case of plunging ahead into the darkness or stopping and paying. When the machine is near the stopping point he lowers the lantern and takes a look at the car's number. If it is a regular who pays his toll in advance, he is allowed to proceed; if not, the lantern is flashed in the driver's eyes and he is compelled to stop.

The Motor Racing Car Association of Maryland is the name of a new association which has been formed in Baltimore for the promotion of automobiling in the State of Maryland. The following are the officers of the association: President, Thomas G. Young; vice-president, Thomas A. Robinson; secretary and treasurer, James G. B. Davy, and Edward A. Cassidy, general manager. The association was formed for the sole purpose of holding races and contests, and the first of these races will be held at the Gentlemen's Driving Park, Labor Day, September 2. The feature event will be a 50-mile race for stripped cars.

### NEW AGENCIES ESTABLISHED.

The Pope-Hartford line, which has heretofore been represented in Philadelphia by the Quaker City Automobile Company, has been transferred to Titman, Leeds & Company, who also handle the Studebaker and Matheson cars.

The Philadelphia representatives of the Mitchell car, the Penn Motor Car Company, have established an Atlantic City branch at 245 North Massachusetts avenue. Manager Walter Cram, of the Philadelphia concern, will also manage the seashore branch.

An important change in Chicago is the taking over of the Stevens-Duryea agency by Louis Geyler, for several years associated with James Levy in handling the Autocar and Lozier lines. The Stevens-Duryea agency will be located at 1532 Michigan avenue.

The Buck Auto, Carriage & Implement Company, Davenport, Ia., has just added the agency for the Oldsmobile to its line, and a carload arrived recently. The firm has already done well with its new line, owing to the reputation enjoyed by the Oldsmobile, and this addition gives it the most complete line of cars and accessories in this part of Iowa.

The Franklin Automobile Company, with branches in Boston, Chicago, and Syracuse, has secured from the H. H. Franklin Mfg. Co., of Syracuse, N. Y., the agency for Franklin cars for New York City territory, which has been held for the past two years by Wyckoff,

Church & Partridge. Salesrooms will be established at Broadway, Amsterdam avenue and Seventy-third street, in the Severn building, about September 1.

### PERSONAL TRADE MENTION.

Le Roy Pelletier, the energetic manager of the Ford Motor Company, of Detroit, was in New York City last week. His observations in the matter of the Selden suit developments found considerable space in the daily newspapers.

John S. Gorham, formerly connected with the Baker electric agency and with the Orlando F. Weber Company in Chicago, has been appointed sales manager of the electric branch of the Chicago sales department of the Columbus Buggy Company, at 1409 Michigan avenue.

A. M. Robbins, well known as a result of his energetic handling of the New York City branch of the Aerocar Company and recently selected as its Eastern sales manager, will not remain at liberty very long as a result of the Aerocar failure. Mr. Robbins is already considering several offers of agency managements.

E. E. McMaster has become western sales manager of the Continental Caoutchouc Company of America, with headquarters at Detroit, Mich. His territory will cover the Middle West. Until recently Mr. McMaster was Detroit manager of the Firestone Tire and Rubber Company, and has been connected with pneumatic tire interests over ten years.

Paul G. Niehoff, who has recently accepted the position of manager of J. P. Beck & Co.'s automobile salesroom and garage, at Saginaw, Mich., states that he was very much surprised to note the great number of fine cars in use in that section of the country. J. P. Beck & Co. are agents for the Rambler and Maxwell lines in their territory, and carry a full line of sundries.

George H. Strout, who recently resigned as sales manager of the Electric Vehicle Company, Hartford, Conn., will join the forces of the Apperson Bros. Automobile Company, of Kokomo, Ind., August 15. The position of sales manager has been created for Mr. Strout, and he will have charge of the selling of the product in addition to supervising the company's various branch houses, which will be increased in number to keep pace with an increased output for 1908. This will include the placing of an entirely new model on the market.

### NEW TRADE PUBLICATIONS.

Descriptive of the automobile fittings manufactured by the Rands Manufacturing Company, Detroit, Mich., the firm's catalogue includes illustrations of tops, with samples of material employed, as well as wind shields and such metal fittings as lamp brackets, tire holders, etc.

The Witherbee instruction book, issued by the Witherbee Igniter Company, 541 West Forty-third street, New York, might find a place with advantage in the pocket of every automobilist, for it contains a quantity of useful information on the care of storage batteries, their installation and recharging, as well as useful hints on remedies for ignition difficulties.

# THE AUTOMOBILE

## Winning of A 24 Hour Record Race

IN winning the 24-hour track race at Brighton Beach with a Thomas Flyer stripped touring car Montague Roberts achieved a double victory by carrying the one-car, two-drivers track record from 833 to 997 miles and staying at the wheel during the entire contest. Although it would be easy to criticise a race of this nature on the ground of sensationalism, the absence of a uniform basis for competitors and the large part which chance plays in a track event, no one will deny that the motors were put to a very severe test and that the highest skill and daring on the part of the drivers was called for. Harry S. Houpt has shown his appreciation of the clever work of his winning driver by offering to put Roberts through an engineering course at Stevens Institute.

Starting at 10:20 o'clock on Friday evening, interest in the race was sustained until the end, and intensified at the last hour by an accident to the Jackson, which, after leading from the seventh hour, had its excellent record marred when victory seemed certain, though tires and a contrary tail-light had caused Roberts the loss of not a few miles. A 40-horsepower Lozier, driven alternately by Smeltzer and Lynch, secured second place with 972 miles, and Burman and Cobe's Jackson, laid up on the outer edge of the track when time was called, took third place with 966 miles. All three broke the track record made by the Jackson at the St. Louis meet.

Mitchell, of lower horsepower and somewhat slower than its competitors, ran a consistent race, finishing in fourth position with 774 miles. These four were the only machines on the track when time was called after twenty-four hours' running. Darracq with 774 miles and Delahaye with 720 were undergoing adjustments at their stands when the race ended. All others, with the exception of the Studebaker, a late starter, and at no time a candidate for first position, had definitely abandoned the contest. Out of fifteen official starters, six only lasted to the end, leaving 60 per cent. unable to stand the 24-hour strain.

BY W.F. BRADLEY

POS.	CAR	DRIVERS	MILES
1	Thomas-Flyer	Roberts	997
2	Lozier	Smeltzer-Lynch	972
3	Jackson	Burman-Cobe	966

THE usual roar of open exhausts, the hustling of officials, then the crack of a pistol, and fifteen stripped touring machines—eleven of them American, four French—shot over the line and rushed ahead on the mile track for honors in the 24-hour Brighton Beach automobile derby. In the dim light Knepper's Frayer-Miller tried to jump ahead, but was so closely followed by Michener's

Lozier and Sturewald's Oldsmobile that at the end of the first hour it was a three-cornered try, each machine having 46 miles to its credit. The

"40" Lozier, the Jackson, the Delahaye and the Pilain hung very close to the leaders, all of them with mileages above 40—a fair record for a standing start.

For a dozen rounds Starter Wagner was busily employed flagging machines without tail lights. Matheson was the first to lack illumination; Dietrich had to stop early on this account, and before thirty miles had been run off probably half a dozen cars had lost some time lighting up in the rear. In the center of the ring, where tire and repair stations had been erected for the competitors, business began early. Dietrich, after a round on three cylinders, rushed into the center and was surrounded by a group of French mechanics, who changed a blown-out gasket and put in an additional supply of lubricating oil. Stoddard-Dayton was early in for fresh tires, and for nearly four hours was laid up waiting for a new rim.

At midnight the Frayer-Miller had got a strong lead on its competitors and figured in the eyes of the numerous spectators in the grand stand as the probable winner of the race. With the distinctive roar of its four exhausts it was cheered as it went by the stands and watched with interest as round after round it went ahead of slower machines. After a time some of the other's warmed up to the business and there were interesting matches between the air-cooled engine and water-cooled rivals. No. 14 Oldsmobile caught up the Frayer-Miller and passed finally on one of the bends, while for a long time Michener's Lozier ran it very

close. For three rounds the Frayer-Miller and No. 14 Oldsmobile raved neck and neck, the latter, though shaken off, refused to be beaten, came to the attack again and finally passed the more powerful machine, though not defeating it on score position.

**Early Mechanical Trouble.**

Mitchell was early in trouble. Before midnight it drove to its stand and had the coil changed, a new radiator fan put in, the bracket of the original one having snapped off, and a new radiator fitted, the fan blades having caused a serious leak. Matheson, pluckily handled by J. B. Ryall with an injured knee cap, was early drawn up near the grand stand for repairs, said to be the replacing of a link in one of the driving chains.

Fuller's Dietrich came in again with its owner cursing his luck in having "brown paper gaskets." A defective igniter was also changed and the French machine went out and did some fast work for a time. Louis Strang, mechanic for Walter Christie in

ROBERTS, A TIRED BUT SMILING WINNER.

radiator filler cap, was carried away and a little injury done to the radiator. A duplicate machine of the same model being available, the radiator and the drag link were changed. On the motor being started up, the car was found to be in good condition with the exception of the steering gear, which was so stiff that it was not considered safe to continue the race.

Some excitement was caused by a fire around the Welch car while work was being done on it at the repair station. Carelessness with a light caused a sudden flare-up before anyone could realize how it had happened. In a few minutes the burning cans were kicked away and the flames on the machine extinguished after a little damage had been done. Over an hour was lost before the car was again got on the track. Numerous idle spectators wandering aimlessly around the gasoline stations made an outbreak of fire always to be feared by their careless handling of matches.

No. 11 Darracq spent a considerable time in its paddock past

ROBERTS COOLING HIS DIAMOND TIRES.

"JACKSON" COBE'S DIRTY FACE.

THE CAMP OF THE CONTINENTAL TIRES.

the Grand Prix, put in with his Pilain from Lyons and had an igniter changed also. As an example of the faulty management at the tire and repair stations, a couple of men struggled ten minutes with a dismountable rim, to discover finally that they had neglected to pay attention to the notice "put this side on first." There were numerous examples of the loss of valuable time through the lack of direction, two or three men tumbling over one another where one would have sufficed, and no one being available to give help where help was most needed. When the cars had been got away again mutual recriminations could be heard around the dimly lighted line of tents. Even the best teams were sulphurous at times.

While running fast on the fourth round, Michener, driving the 60-horse-power Lozier, got into soft sand on the outside of the track, on the curve just past the officials' stand. At this point the track was so badly lighted that it was difficult for the drivers to judge their position. Under the severe strain the Lozier drag link snapped in two and the machine, no longer under control, crashed through the hedge on the inner side of the track, coming to a stop on the grass. On striking the top rail the

the grand stands, undergoing repairs. Owing to the stripping of several teeth on a gear in the differential, a new rear axle had to be fitted. It is claimed that the defective pinion was not supplied from the factory, but was made in America, of steel which proved to be inferior in quality. Some hours later, while McCalla, a young Irish driver, new to American track racing, was doing

some fine speeding with the Darracq, a rival machine cut in upon him very short, causing a collision, which smashed a front spring just behind the hanger.

In the early morning, while Louis Strang was driving No. 10 Pilain, a French product, on the straight home stretch, the left front wheel of the car suddenly collapsed after a slight skid. At the time of the accident the machine was nearing the opening into the paddocks, Strang driving, according to his custom, as close to the rail as possible. The car dashed onto the grass, carrying away a few yards of the railing, and ran a couple of hundred yards on three wheels before pulling up. On the Pilain the throttle lever is in the center of the steering wheel, and owing to its tendency to close down and the difficulty in such a position of holding it open, the driver had taped it in wide-open position.

"HARRIS OIL" BAILEY AND RACE MANAGER PICKENS FEEDING LOZIER PILOT.

THOMAS, JACKSON, LOZIER, AND WELCH ROUNDING THE LOWER TURN DURING THE MORNING HOURS ON SATURDAY.

It was impossible to unfasten the tape immediately and equally difficult to get out the clutch, which accounts for the machine traveling so far after the wheel broke. Six people standing near the railing—the inside of the track was forbidden to spectators—were more or less seriously injured by the flying wheel and railings. Without delay a car was sent to New York for a new front axle, and in less than three hours the machine was on the track again. A serious crack had been made in the forward end

tor. A little later the Olds was back again, when the radiator was taken down and the leaky tubes carefully soldered.

Daybreak came as a relief to every driver on the track, for, owing to the insufficient lighting, driving had become very dangerous. F. O. Fuller, at the wheel of the Dietrich, complained more than the others of the state of the track, his position indeed being serious, for the only lights he had were oil lamps attached to the dashboard. Several drivers tried to impress on the officials

of the frame as the result of the accident, and when this was noticed by one of the officials the machine was ordered to quit. Strang then alternated with Mongini on the Delehay.

No. 17 Stoddard-Dayton, after doing some work on the rear axle and finally obtaining the rim which had put it out of the running for several hours, went out again in the early morning and was followed by No. 15 Oldsmobile, in for a repair to radia-

the necessity of putting more lights around the course, but it was not done. The day brought disaster to the Frayer-Miller, for after it had run off 269 miles and was leading by a fair margin, a front tire blew off the rim, causing the machine to turn completely around and crash through the outer hedge. The forward cross member of the frame was bent inwards, the forward ends of the frame bent and the bolts holding the starting handle bear-

READY FOR THE START OF THE GREAT 24-HOUR RACE—IT WAS NECESSARY TO PLACE SOME CONTESTANTS IN THE SECOND ROW.

ing broken off. No injury was done to the engine or transmission. Most of the spectators having left the track, it was not until late in the day that the failure of the favorite was heard of by the public.

Frayer-Miller out, Jackson went into first position, with the Thomas and the Lozier hanging fairly close. All Saturday morning the three remained in the same relative position, the Lozier once getting up to the mileage of the Thomas, then dropping back to its previous place. Mitchell, after the radiator trouble of the night, did some very steady and consistent driving, working up to the leaders by sheer regularity of running. No. 14 Oldsmobile did some fast work at times, gaining a lot of the lost mileage of the night. The Dietrich cracked the two rear cylinders early in the morning and occupied a stationary position in the paddock for the rest of the day.

After having changed a driving shaft, broken through colliding with a car, the Darracq again made a spectacular display. McCalla, who handled the automobile most of the time, passed every machine on the course at intervals, but had too great a previous loss and had too frequently to leave the track for adjustments to hope to get entirely to the front.

At 5:30 o'clock Saturday evening the race was called off for nearly an hour to allow of the sprinkling of the track, which had become so dusty that driving on the curves was really dangerous. No work could be done on the machines, but drivers took advantage of the interval to wash

out some of the dust and take solid refreshment on board.

On the resumption of the racing only six machines were left in the race, namely: Jackson, Thomas, Lozier, Mitchell, Darracq, and Delahaye. The two Oldsmobiles had gone out, one with a cracked cylinder, the other with a radiator which refused to hold water. The Welch had taken down its crankcase and discovered bearings so badly worn that it did not start again; the Stoddard-Dayton was waiting for a new transmission which failed to arrive, and J. B. Ryall had given official notice that owing to his own injured leg and the tired condition of his companion he would not continue any further.

#### Numbers Diminished, but Interest Increased for Final Dash.

Thomas, Lozier and Jackson were closely bunched for the final evening dash. About 7:30 o'clock Jackson lost a certain amount of mileage through having to leave the track to change a valve, the spring having broken and damaged the valve stem. Mitchell lost some time through the breaking down of the wooden platform on which were carried the storage batteries. Mongini, driving the Delahaye from Paris, lost a lot of time through trifling matters. One of the driving chains broke twice, eight new tires had to be put on during the afternoon, a single tire sometimes occupying half an hour; then the gasoline tank broke loose and had to be tied up with rope. On breaking loose later, a tank from the Pilain was put in its place. Studebaker, though still running occasionally, was out of the contest.

A most exciting contest was in progress, involving Jackson, Thomas and Lozier, when lights were lit, rendered still more exciting by the uncertainty of the lights to keep burning. The Thomas suffered particularly, its tail lights going out thrice and the car being promptly stopped by the officials to light again. Once in their anxiety to enforce the rules the Jackson car was flagged by mistake and made to slow up while all its lights were burning brightly. After a third stop to light the tail lamp of the Thomas, William McIlvrid jumped onto the rear of the car and carried a lamp in his arms to the end of the race.

At the end of the twenty-third hour Jackson was still leading, but at the beginning of the last hour began to misfire and broke down on the course, unable to reach its stand. A set screw on the timing gear had worked loose, causing a disarrangement of the gears of such a serious nature that it was recognized as impossible to get the machine going before the calling of time.

Mongini's Delahaye had gone in to change a tire during the last hour, and while there took on more gasoline. In the darkness and the confusion the cans were mixed and a certain quantity of water was poured into the tank. After every effort had been made to crank the engine, the tank and carbureter were emptied and fresh fuel put in. A few seconds before the pistol fired the motor began to roar again in healthy tones. Half a dozen yards away the Darracq was being worked upon by the driver and mechanic, the magneto causing trouble. It was not in order when the race was called off.

The Jackson traveling only three miles in the last hour, it was an easy task for the Thomas and Lozier, both of which were running excellently to the finish, to forge ahead and secure first and second places. Mitchell, the only other machine on the track at the last moment, retained fourth position, and Darracq and Delahaye followed in fifth and sixth places.

#### Some Features of the Handling of the Race.

Credit is due to the officers of the Long Island Automobile Club for the generally efficient manner in which the race was handled. The mechanical timing arrangement, used here for the first time and for which F. G. Webb was responsible, gave perfect satisfaction. The device consisted of a mechanical counter for each competing car fastened to a table, with the number of the machine which it recorded placed in front of it. As one timer called off the number of the car passing the judges' box another pressed the button, and an additional mile was placed to the credit of the car entitled to it. At every moment of the race the exact position of the cars could be obtained, without

hesitation or delay, and there was a pleasant alacrity in announcing positions to the press and the public.

Thanks to the efforts of Superintendent William Clare, the Brighton track, generally a poor place for fast automobiles, was put into good shape for the race. Had the lighting of the course been more brilliant and the police been more active in keeping idlers out of the center, no fault could have been found with the management of the 24-hour race. A. R. Pardington, F. G. Webb, C. J. Edwards and R. G. Kelsey, prominent among the officials of the Long Island Club, were largely responsible for the success of the meet, the business end of which was capably handled by the United States Motor Racing Association, W. H. Pickens being the leading factor. Starter Wagner and assistants Clinton and Camacho made a trio of energetic officials.

In all probability Brighton Beach will again be the scene of a 24-hour auto race this month. Conditions, as at present drafted, provide for August 23 and 24, with a team race of two cars and three drivers. The first twenty entries only will be accepted.

### DETAILS OF THE MOST SUCCESSFUL CARS.

1. Thomas Flyer, 60-horsepower, model 1907. Four cylinders, cast separately, 5 1-2 by 5 1-2 bore and stroke, sliding gear, selective type, four speeds and reverse, double chain drive, metallic clutch, Bosch high-tension magneto and Atwater-Kent spark generator. Diamond tires.
2. Lozier, 40-horsepower, model 1907. Four cylinders cast in pairs, 4 5-8 by 5 1-2 bore and stroke, sliding gear, selective type,

WHERE THE FRAYER-MILLER WENT THROUGH THE FENCE.

four speeds and reverse, double chain drive, multiple disc clutch, Bosch high-tension magneto. Diamond tires.

3. Jackson, 40-horsepower, model G, 1907. Four cylinders, cast separately, 5 by 5 inches bore and stroke, sliding gear, progressive type, three speeds forward and reverse, shaft drive, multiple disc clutch, jump spark and storage battery. Diamond tires.
4. Mitchell, 30-horsepower, model 1907. Four cylinders, cast separately, 4 1-2 by 5 inches, sliding gear, progressive, three speeds forward and reverse, shaft drive, cone clutch, ignition by jump spark. Hartford tires.
5. Darracq, 40-horsepower, model 1907. Four cylinders, cast in pairs, 5.1 by 5.1 inches bore and stroke, sliding gear, selective type, three speeds forward and reverse, shaft drive, cone clutch. Bosch high-tension magneto, accumulator and coil. Continental tires.
6. Delahaye, 50-horsepower, model 1907. Four cylinders, cast separately, 5.5 by 5.9 inches bore and stroke, sliding gear, progressive type, four speeds forward and reverse, chain drive, cone clutch, low-tension Bosch magneto. Continental tires.

### How the Wheels of the Racers Were Shod.

Diamond, Continental and Hartford supplied the tires for the competitors in the 24-hour race. Those equipped with the Diamond Company's product were Thomas, Lozier (2), Jackson, Oldsmobile (2), Stoddard-Dayton, Dietrich, Welch, Frayer-Mitter, Studebaker and Matheson. Continental equipped Darracq, Delahaye and Pilain, and Hartford bandaged the Mitchell wheels.

AS IT LOOKED FROM THE GRAND STAND DURING DAYLIGHT.

### WHAT PRECEDED THE LONG RACE.

Walter Christie, in the front drive racer which he built for the French Grand Prix, furnished the fastest burst of speed on the Brighton Beach track by doing the mile in 54 3-5 seconds, thereby wiping out Barney Oldfield's time of 1:00 2-5, which had stood for two years. It was the first occasion the American public had had of witnessing Christie's new machine at work.

Guy Vaughn, driving a 30-horsepower Stearns, won the ten-mile contest for runabouts of 30-horsepower, and was also winner of the ten-mile Manhattan championship for runabouts of 60-horsepower and under. In the five-mile Atlantic sweepstakes Vaughn secured his third victory with a Stearns, in 5:11; J. B. Ryall, driving a Matheson, was second in 5:38 1-5; F. O. Fuller's Dietrich came third in 5:57.

Owing to the late start lights had been lit on the track before H. Michener, in a 60-horsepower Lozier, captured first place in the 100-mile championship for stock touring cars, his time being 2:06:21. A 30-horsepower Packard, driven by Stewart Elliott, came second in 2:12; Studebaker, 30-horsepower, driven by W. Dittman, covered 99 miles; Thomas, 40 horsepower, driven by William McIlvrid, traveled 98 miles, and Guy Vaughn, on a 30-horsepower Stearns, furnished 96 miles. A series of minor troubles marred the race. Guy Vaughn led for 47 miles, then lost his position through the breaking of a gasoline feed pipe. The Packard, driven by Stewart Elliott, then took first place until tire trouble put it down, and the Stearns forged ahead again, only to be set back by the breaking of a driving chain. Michener's Lozier then came ahead and won in fine style, with the Packard second, minus a rear tire for the last nine miles.

A NIGHT VIEW OF THE SPECTACULAR CONTEST.

The Dietrich and the Matheson dropped out early. The summary of the afternoon's events is as follows:

#### TEN MILES, RUNABOUTS, 35 HORSEPOWER AND UNDER.

1. Stearns, 30-h.p.; driver, Guy Vaughn.....11:23
2. Pilsain, 28-32-h.p.; driver, Louis Strang.....13:16 3-5
3. Peerless, 30-h.p.; driver, Jack Rutherford.....13:20 4-5

#### TEN MILES, MANHATTAN CHAMPIONSHIP, RUNABOUTS.

60 horsepower and under, equipped.

1. Stearns, 30-h.p.; driver, Guy Vaughn.....12:01 1-5
2. Packard, 30-h.p.; driver, Stewart Elliott.....12:02 1-5

#### FIVE MILES, ATLANTIC SWEEPSTAKES, OPEN.

1. Stearns, 30-h.p.; driver, Guy Vaughn.....5:11
2. Matheson, 50-h.p.; driver, J. B. Ryan.....5:28 1-5
3. De Dietrich, 30-h.p.; driver, F. O. Fuller.....5:57

#### 100 MILES, STOCK TOURING CARS AND RUNABOUTS, 60 H.P. AND UNDER.

1. Lozier, 60-h.p.; driver, H. Michener.....2:06:21
2. Packard, 30-h.p.; driver, Stewart Elliott.....2:12
3. Studebaker, 30-h.p.; driver, W. Dittman (covering 99 miles).
4. Thomas, 40-h.p.; driver, W. McIlvrid (covering 98 miles).
5. Stearns, 30-h.p.; driver, Guy Vaughn (covering 96 miles).

### WILL FEATURE STRIPPED CHASSIS RACERS.

BOSTON, MASS., Aug. 12.—Active preparations are being made for what will mark a departure in the annals of track racing in this country at the meet to be held on the Readville track on Labor Day, September 2. In the first place, the card will be made up almost entirely of long-distance races, and secondly, the feature of the meet is to be a stripped-chassis race on much the same order as the event planned to follow the Vanderbilt race here, had the latter been held. That is, a stripped touring car race along the lines advocated by R. H. Smith, of the Premier Motor Car Company, and Edgar Apperson, of the Apperson Brothers Automobile Company. There are to be five events in all, leading off with a 25-mile race for gasoline stock touring cars, followed by a second event at the same distance for gasoline runabouts; then there will be a 10-mile open for stock steamers, followed by a 50-mile open-for-all stripped stock chassis, winding up the program with a 5-mile open for cars constructed prior to 1905. It will be noticed that both the two last-named events are of a novel nature, and the racing committee, consisting of L. R. Spere and F. A. Hinchcliffe, are of the opinion that they will meet with considerable popular favor.

### SOUTH AMBOY BRIDGE NOT YET OPEN.

Numerous inquiries are constantly being received at the office of the Automobile Official A. A. A. Blue Book as to the present status of the bridge connecting Perth Amboy with South Amboy, N. J., across the Raritan River. As this provides a direct route to Jersey coast resorts and means a saving of fully thirty miles, most inquirers wish to know if the bridge has been reopened to traffic. This is not the case as yet, and it is doubtful at present whether it will be opened much before September 1. In the meantime all tourists going to north Jersey resorts should take the route via New Brunswick.

### TO DO AWAY WITH THE WATER BREAKERS.

WILLIAMSPORT, PA., Aug. 13.—The roads in this part of Pennsylvania are well built on a limestone foundation, but they are distinguished by that most objectionable of all road obstructions, the water breaker, built diagonally across the highway at intervals of about every 200 feet, making running at more than a very slow pace impossible. The Center County Automobile Club is now taking up the matter of starting a movement to improve the roads, and this will be the first object of attention.

### TRYING OUT THE ROYAL FOR 1908

CLEVELAND, O., Aug. 12.—Roert Jardine and Archie McLaughlin, of the Royal Motor Car Company, accompanied by J. E. Iams and S. K. Clark, of Iams Bros. & Co., Pittsburg agents for the Royal, left Cleveland last week on a long trying-out trip with the 1908 Royal. The party went to Jamestown, N. Y., and then south into the mountain country of Pennsylvania.

### POPE CO. IN RECEIVER'S HANDS.

HARTFORD, CONN., Aug. 14.—The Pope Manufacturing Company, of this city, together with its subsidiary concerns, the Pope Motor Car Company and the Federal Manufacturing Company, to-day were placed by the Chancery Court of New Jersey in the hands of Egbert J. Tamblin, attorney, as receiver. Albert L. Pope has been appointed receiver in Connecticut and the Northern and Southern Federal districts of New York.

Similar proceedings will at once be taken in every other State in which the company has property. The latter is a New Jersey corporation organized in 1903 to succeed to the properties of the then defunct American Bicycle Company. It owns all the capital stock of the other companies mentioned, amounting to \$10,000,000, of which \$1,000,000 is common, \$2,390,976 first preferred, and \$8,633,100 second preferred.

According to the counsel to the receiver, the nominal assets of the Pope Manufacturing Company are \$7,500,000, with liabilities of about \$1,500,000, while the assets of the Pope Motor Car Company are placed at \$3,250,000, with liabilities of but \$1,000,000, the total estimate therefore making the combined assets \$10,750,000 and the liabilities \$2,900,000. The company's balance sheet for July, 1906, showed total assets of \$23,717,155, and after deducting liabilities the surplus was only \$23,860 as against \$23,859 in 1905 and \$50,993 in 1904.

Albert Rathbone, of Joline, Larkin & Rathbone, of counsel to the receiver, said to-day:

"The necessity for the present proceeding arises from the curtailment of credit and reduction of loans on notes. In other words, the receivership proceedings are the direct outcome of the present rigid money conditions. Loans were falling due and the company was unable to raise money with which to meet them, so that the placing of the company in the hands of a receiver seemed to be the only alternative that would conserve the rights of the creditors. We have every reason to believe that the assets are worth many times the amount of the liabilities."

The company has factories at Hartford, Conn., Hagerstown, Md., Toledo and Cleveland, O., and Indianapolis, Ind.

The officers are: Albert A. Pope, president; Albert L. Pope, vice-president; C. E. Walker, second vice-president; George Pope, treasurer, and W. C. Walker, secretary. According to the latest list available, the directors are: W. A. Read, Colgate Hoyt, F. S. Smithers, and George F. Crane, of New York; Albert A. Pope, Albert L. Pope, and George Pope, of Hartford, Conn.; Charles Hayden and A. W. Pope, of Boston, Mass., and Paul Wilton, of Ridgewood, N. J.

Pope automobile products have had a varied career from the technical standpoint, and their builders have been unfortunate in that their improvements in the evolution of up-to-date designs have not always met with the approval of the automobiling public. It will be recalled that the Pope-Toledo, made at the western factory in Ohio, proved very popular up to last year, when the design was abolished and something totally new substituted. For one reason or another, the Pope-Tribune, the product of the Hagerstown, Md., plant, has never achieved any great sale, and up to last year the Pope-Hartford was not over-successful, a number of the 1905 models being marketed at a sacrifice at the end of the season. A sweeping revision on the design—in fact, the creation of a totally new car under the name of Pope-Hartford—reversed matters where the Connecticut plant was concerned, and its output has been very successful.

### PLANS FOR THE NEW GARFORD CAR.

CLEVELAND, O., Aug. 13.—The Garford Motor Company, the new corporation recently organized to market complete automobiles, will put out a car under its own name the coming season. Albert R. Davis has been appointed secretary and sales manager of the company. The entrance of the Garford people into the field of complete automobiles brings into the industry another very strong concern, destined to become a leader.

## ALGONQUIN HILL CLIMB HONORS DISTRIBUTED

CHICAGO, August 12.—Hills that are hills in the prairie States are as scarce as the proverbial hen's teeth, but that the autoists of the Middle West know how to take full advantage of the occasional lonely excrescence that dots the plain is amply evident from the report of the Algonquin hill climb, held under the auspices of the Chicago Motor Club last Friday. What

LELAND AND HIS SIX-CYLINDER STEARNS AT THE STARTING POINT.

might have proved a mishap of so serious a nature as to have caused the abandonment of the event happened the day before when Phil Kirk, at the wheel of the Apperson racer built for the 1906 Vanderbilt Cup race, smashed into a Maxwell runabout in one of his preliminary trials. With the exception of David Beecroft, who was on the running board of the racer and who received a sprained ankle, bruises were the most serious injuries, though the little car was picked up and thrown into the ditch.

The climb itself was divided into two sessions, one in the forenoon on Perry Hill, a quarter-mile long elevation which the contestants were required to tackle from a standstill, and the ascent of both Perry and Phillips hills in the afternoon from what was jocularly termed a broad jump, as this was what the flying start was converted into by the presence of a bad water breaker right at the foot of the hill which sent the cars high in the air when they hit it.

Interest throughout the day centered in the performances of the Stearns six-cylinder runabout, driven by F. W. Leland, and the Apperson "Jack Rabbit," handled by Phil Kirk. Last year's mark of :34 for Perry Hill, made by the Pierce Arrow, was cut to :26 1-5 by Leland, and to :28 by Kirk's pink "Jack Rabbit," both of these machines being placed in Class 5, according to the system of handicapping based on the total piston area of the cars, time, and weight of car and driver, the area being multiplied by the combined times up the two hills and divided by the third factor of weight.

The three thousand or more spectators were intensely interested in the actual events, but regarded the method of figuring somewhat in the light of mathematical juggling, while some of the victories were popularly put down to mental arithmetic, though the entrants themselves made no protest. For instance, the 14-horsepower Maxwell in Class 2, driven by W. B. Jameson, made the morning climb in :56 flat, but E. L.

Welant's 22-horsepower Buick, which took 1:12, was awarded the victory. Frank Nutt's 50-horsepower Haynes made it in :38; but the palm was awarded to H. Branstetter's 20-horsepower Moon, which required 41 3-5 seconds to complete the distance.

It was a day of general record breaking, and though the road was in no better condition than last year, the distance was about fifty feet less. Late in the day Phil Kirk, in the big "Jack Rabbit," got things down to :27 2-5, and Charles Van Sicklen's smaller car of the same make did it in :32, while the Stearns 30-horsepower, driven by Leland tied its former record. Not the least novel event of the day was the work of a small fleet of electrics, entered by Carl Metzger, of the Woods Motor Vehicle Company, at the last moment. From a standing start F. J. Newman piloted one of them up in :56 flat, and was followed by Metzger himself in another, which could not do better than 1:05 1-5, while the third was still slower, taking 1:10, though the first bettered the times of no less than twelve of the gasoline machines.

Mathematical victories may be all very well for the sharps, but the man at the roadside wanted real victories that he could see. Consequently interest was centered in the free-for-all. The events of Class 5, which preceded it, showed how evenly matched were the Stearns and the Apperson, the former making it in :33 1-5 and the latter in :33 flat, though, owing to their great piston displacement due to having six cylinders and their light weight by comparison, neither was in the figuring, only getting fifth and ninth.

In the free-for-all actual times up both hills counted.

Leland led off, and while making a fast pace lost a tire from his right rear wheel at the last turn, but showed his masterly control of the car by keeping it in hand and finishing in :34. He was followed in by the tire, which, after running 200 yards or more, still had sufficient force left to bowl over a young girl; no damage resulting, however. Then Kirk made an essay at it, and, bounding, swaying and bumping in the Apperson up over the turns and bad spots like a rubber ball out of a gun, succeeded in making it in :33 4-5, which cut down the 1-5 second lead the Stearns gained in the morning.

There was some talk of running off the tie, but Referee Donald refused to sanction it owing to the poor condition of the

PHILIP KIRK IN APPERSON "JACK RABBIT" ROUNDING TURN ON THE HILL.

road. The Stearns contingent had earlier entered a protest to the effect that neither of the Apperson cars was from stock owing to the use of rubber guards on one and the absence of a muffler on the other, but withdrew both. The Berliet was also protested by the Packard backers as not having a regulation body and this was referred to the committee for decision and will be brought up for consideration later.

Honors were very well divided, no car taking more than one event. The 12-horsepower Autocars, driven by F. C. Vaughn and James Levy, ran first and second in Class 1, the event in which they figured favorably last year, while in Class 2 the 22-horsepower Buick, handled by E. L. Welant, made the best time in its class both morning and afternoon. In Class 3 the 24-horsepower Columbia, skillfully handled by P. Bellew, beat its rivals in point of time on both, and its aggregate percentage was considerably the best of the day by quite a margin.

The 30-horsepower Moon, which was entered in Class 4, calling for a piston area of 65 to 90 square inches, ran as a dark horse, the same as it did last year, only being listed at the eleventh hour by H. Branstetter. Likewise he repeated his performance of last year by carrying off the handicap honors in his class as he did in 1906 with the Queen under similar circumstances. It was Frank Nutt's Haynes roadster that made the best time in this class. The 40-horsepower Pierce-Arrow, driven by P. Hoffman, carried off the victory in Class 5, known as the "big bunch," as it called for cars having a piston area of 90 square inches and over. It will be recalled that it was Hoffman who carried off all the honors last year by making the fastest times in the big Pierce. J. W. Norden's 40-horsepower Berliet took a close second in both Class 3 and Class 5.

**Summaries of Morning Events on Perry Hill**

**CLASS 1—PISTON AREA UNDER 35 SQUARE INCHES.**

- 1. Autocar, 12-h.p.; driver, F. C. Vaughn.....1:03 1-5
- 2. Autocar, 12-h.p.; driver, James Levy.....1:05 2-5
- 3. Holman, 10-h.p.; driver, J. M. Renegar.....1:20

**CLASS 2—PISTON AREA 35-50 SQUARE INCHES.**

- 1. Maxwell, 12-14-h.p.; driver, W. B. Jameson.....0:56
- 2. Buick, 22-h.p.; driver, E. L. Welant.....1:12
- 3. Reliable Dayton, 12-h.p.; driver, J. S. Blything.....1:35

**CLASS 3—PISTON AREA 50-65 SQUARE INCHES.**

- 1. Columbia, 24-h.p.; driver, P. Bellew.....0:48
- 2. Jackson .....0:48 3-5
- 3. Jackson .....0:51

**CLASS 4—PISTON AREA 65-90 SQUARE INCHES.**

- 1. Haynes, 50-h.p.; driver, Frank Nutt.....0:38
- 2. Moon, 20-h.p.; driver, Harry Branstetter.....0:41 3-5
- 3. Buick, 24-h.p.; driver, A. D. Trumbull.....0:44 3-5

**CLASS 5—PISTON AREA OVER 90 SQUARE INCHES.**

**MILWAUKEE'S SUCCESSFUL HILL CLIMB.**

MILWAUKEE, Wis., Aug. 12.—With a large field in all classes, ideal weather conditions, and well-matched contestants in all the events, the first annual hill climb of the Milwaukee Automobile Trade Association proved a huge success. It was held on Sentinel Hill and the work of No. 23 Peerless, driven by August Jonas, who made the climb in :29 3-5, was easily the feature of the day.

There were eight events, the cars being listed according to a price classification in seven of them, while the last was a free-for-all. With the exception of Class 2, open to cars listing at \$1,350 and under, for which the Schandain Cup was offered, the other six events in the price class were for cups offered by the association, while the free-for-all was for a trophy donated by the Milwaukee *Sentinel*, which was captured by the Peerless.

With its numerous bad turns and stiff grades, the hill was well calculated to test both the cars and drivers, and a bad twist right at the start accounted for some of the slow times made.

A Ford runabout, entered by the Curtis Automobile Company, was the winner of the first event for small cars, making the climb in :46 2-5, which was cut to :45 2-5 by the same car next event.

A 22-horsepower Buick, entered by Bates-Odenbrett, brought this down to :41 1-5 in Class 3, cars listed at \$2,000 and under, and then it suffered a great drop to :35 2-5 after the attack of the 35-40-horsepower Rambler, driven by A. W. Shattuck, who was the winner in Class 4, \$3,000 and under. This car made the best time of the day for touring cars with four passengers up. In Class 5 Shattuck bettered his own record by two seconds, making the lowest figures up to that time—:33 2-5.

The 30-horsepower four-cylinder Jackson came very close to the record in the free-for-all, making the climb in :30 4-5, the next best time of :32 1-5 being made by a Wayne of the Sollday Motor Car Company, with Shattuck's Rambler next in :32 2-5. The two-cylinder cars distinguished themselves, the Buick being the only one of this class to win a cup, and the Jackson, which made a mark of :35 2-5 in the free-for-all, taking the difficult rise on the high gear.

**CHICAGO'S MUCHLY MUDDLED 24-HOUR RACE.**

CHICAGO, August 12.—The muchly muddled scoring of the 24-hour race at the Harlem track, July 12 and 13, makes it a certainty that the Racing Board of the A. A. A. will have a task in trying to figure out a winner. Perhaps this will be an impossibility, though it would appear that C. A. Coey, the announced winner, will be shorn of his supposed laurels. Affidavits of C. H. Barnes and E. E. Esch, two of the scorers, tell of alleged irregularities on the part of the chief scorer, L. H. Jackman. A charitable conclusion of the whole affair shows that the scoring was badly done, though there is no absolute proof of an understanding to make Coey the winner. The impression prevails that the Chicago Automobile Club will not permit another meet to be held, apparently under its auspices, without giving the most careful attention to the official list, and especially to those entrusted with the scoring of any long-distance event. The United States Automobile Racing Association contents itself with saying, through W. H. Pickens, that the club was to have supplied the officials, and the best possible was done when the club failed to attend to this part of the meet.

# CAST ALUMINUM FOR AUTOMOBILE WORK\*

By THOS. J. FAY, E. E.

TIME was when aluminum appeared as the most useful of all the cast metals from the point of view of the automobile, but time has cast its shadow on this wonderously light product, and it stands to-day stripped of every qualification save the two redeeming features, viz.:

- (a) It may be cast into intricate shapes.
- (b) It is of low specific gravity, hence it is of light weight.

As the tests—see records Nos. XI to XV inclusive—will show, none of the cast aluminum products are strong, while the best of

Rochester, N. Y., Feb. 7, 1905.

them are difficult to cast. Of the large number of castings in the shape of motor and transmission cases used from time to time under the direction of the author, the major portion possessed a low strength and in no single instance is it believed the tensile strength of any casting good enough to use exceeded 20,000 pounds per square inch at the outside, whereas, the best castings—castings free from imperfections—probably did not possess a tensile strength exceeding one-half of this value.

It is far from the purpose here to decry the use of aluminum for motor and transmission cases, for, in spite of the low average strength of the product, it does serve the purpose very well indeed, but the truth about it is that is all it can lay claim to. In the early days, when aluminum was a "boomed metal," it was used for diverse purposes as brakedrums, and, in fact, to the exclusion of the heavier and far stronger products as steel castings, steel-bronze and die-forgings of steel. Failures in service were the harvest, and a little investigation disclosed a discrepancy as between the promises and the facts so great as to be astounding. Some of these tests of promised strength emanated from sources that were regarded as authoritative, and it is not easy to understand how this false idea could have been engendered.

With a view to affording an adequate volume of data to substantiate the position the author takes in the matter, the Table I is offered in addition to the test records above referred to, and there is much other evidence to be had at every hand.

If, then, it is true that aluminum, in spite of its low strength, is a desirable metal to employ for certain specific places in automobiles, it will be well to know how to get the most out of it by way of strength without sacrificing lightness to an extent likely to render steel-bronze a better selection.

Aluminum is of increasing strength for decreasing thickness of walls, measuring this strength in pounds per square inch. It

follows, then, that thin walls should be aimed at from the strength point of view, but there is a limit to the extent that this phenomenon can be taken advantage of. The limit referred to is the foundry limit of thickness that can be cast if it is taken for granted that thin walls will not contribute unduly to the noise in operation. Undoubtedly thin walls tend to noisiness and for a perfectly quiet motor thickened walls of the motor case would contribute a quota.

The foundry limit for thin walls is about 3-16 inch, and this is a wall thin enough to have some effect upon the amount of noise likely to be experienced. At all events, many motor cases are now in service with walls as thin as 3-16 inch, and as a rule properly designed cases with walls of this thickness turn out good sound castings, although if this matter were left to the foundry the walls would be 1-4 inch or even 5-16 inch thick. Besides having the walls thin to attain the maximum unit strength and lightness dictated by the use of aluminum, the radius should be great and all inequalities of section should be avoided. Sweeping curves, plain patterns free from "draw backs" and, in so far as it is possible to do so, the avoidance of cores, loose pieces and other complex pattern work would augur success.

The specific gravity of aluminum for castings is about 3.00—see test record XI—hence the weight of one cubic inch of this product would be:

$$W = \frac{62.425}{1728 \times 3.0} = 0.11836 \text{ pounds, whereas steel-bronze has a}$$

weight per cubic inch of about 0.2991 pounds. It therefore follows that:

$$\text{Ratio} = \frac{0.291}{0.108} = 2.7, \text{ nearly.}$$

If, then, steel-bronze cases were to be cast one-tenth of an inch thick and aluminum was cast 0.27 inches thick, the weight would

SUBJECT: CAST ALUMINUM  
 NUMBER: XIV MARK: PHYSICAL  
 NEW YORK 4-17-07

THE PRODUCT TESTS MUCH BETTER THAN THE AVERAGE MIXTURE BUT IT DOES NOT SEEM TO DOMINATE THE MARKET EVEN SO THERE IS QUITE SOME QUESTION ABOUT MAKING CASTINGS WITH THE ALUMINUM MIXTURES SHOWING OVER MUCH STRENGTH. THE STRENGTH OF ALUMINUM CHANGES WITH THE THICKNESS OF THE CASTING ABOUT AS FOLLOWS. THICKNESS IN INCHES.

0.10	0.20	0.30	0.40	0.50
100	0.95	0.90	0.86	0.87

be the same for both, but the strength would not be the same, for the relative strength values are not the same as the relative weight values. If aluminum is accredited with a tensile strength of 10,000 pounds per square inch, and that is about all to be figured upon with safety, steel-bronze will be seven times as strong on an equally safe basis of figuring. Coupons cut from cases, then, would show up relatively as follows:

Steel-bronze 1" X 0.1 X 70,000 = 7,000 pounds  
 Aluminum 1" X 0.27 X 10,000 = 2,700 pounds

And  $\frac{7,000}{2,700} = 2.6$ , nearly = strength of bronze over aluminum for equal weight.

These deductions come very near to showing what can be done if the question of noise does not enter into the calculation. The steel-bronze 0.10 inch thickness of walls, while thin, to be sure, can be cast quite as readily as the aluminum 0.27 inch thickness of walls, whereas, from the cost point of view, the steel-bronze would cost about one-half as much as the aluminum. To sum up, then, it might be said:

- (a) Steel-bronze would offer 2.6 times greater strength for equal weight under the conditions set down.
- (b) Steel-bronze would cost one-half as much as aluminum under the same conditions.

This way of looking at it puts aluminum in a rather unfavorable light, because many aluminum castings are made less than 0.27 inch thick, and they seem to hold out against breakages, but the thinner castings would fall off in strength, so that what is gained in one way is lost in another; hence, it may be said that the sparing use of steel-bronze affords a measure of strength for a weight possible to tolerate that renders the steel-bronze a good competitor of the aluminum.

In practice, while aluminum is used very extensively for the purposes in question, steel-bronze is used but very little; indeed, the Locomobile is about the only notable instance of persistently holding to steel-bronze for motor cases in the past. The makers put steel-bronze in the motor case of the B. L. & M. racing car for 1906 and found it quite desirable in many ways. This hap-

pened after repeated failures to procure good aluminum castings because the walls were very thin and the shape was irregular. This instance proved that steel-bronze castings could be made thin, whereas aluminum did not so readily lend itself to this end.

The author, in his capacity as consulting engineer, examined a broken aluminum motor-case of a well-known foreign car but recently, and while the walls were quite thick and the motor arms were very deep and massive, about 8 mm. thickness, the case failed in service and an examination of the casting disclosed alarming conditions. As a matter of fact, a few light taps with a hammer caused the arms to fly into pieces, and, no matter what part of the case was so treated, the same brittle tendencies were manifested. This motor-case was not designed for lightness at all, nor would it have been difficult to make a case for this motor of steel-bronze and have it much lighter, whereas, from the strength point of view, *steel-bronze would have been vastly superior.*

Aluminum is a product very easy to render brittle in the process of casting, as, for illustration, a little overheating will do the trick, or the use of scrap aluminum is enough to render the castings unfit for automobile work. Iron—as an impurity—has a decidedly weakening tendency, even though the increment present be but slight. The alloys of aluminum, zinc and copper seem to afford the best static strength results and the zinc can be as high as 15 per cent. This element tends to rough-looking castings as well as brittleness, and may render the castings a little unruly, but the tests available show a decided increase in strength over other products thus far examined.

The specific gravity of aluminum itself is 2.6 to 2.7, hence the alloys are considerably heavier, since some of them have a specific gravity of 3.00 and even slightly more. The melting

point of aluminum is  $1,160^{\circ} F. = \frac{(1,160 - 32) \times 5}{9} = 626.6^{\circ} \text{Centi-}$

grade; hence, aluminum is a metal with a low melting point and it also "burns" easily; moreover, it will not stand "soaking."

Aluminum, while it dissolves in alkaloids and in hydrochloric acid readily, is not seriously affected by sea water, as some are wont to claim, and it is not therefore debarred from use for

motor and transmission cases in motor-boat work. The author has been able to experiment upon this phase of the question at considerable length and has had to do with aluminum cases in such motor boats as *Simplex III*, *Challenger*, *Dixie*, *Vingt et un II*, *Simplex I*, *Simplex II* and other products. Even at the end of three or four seasons the aluminum cases were found to be in thoroughly good condition.

Aluminum is highly electro-positive, and if it is permitted to form a couple with some other metal, submerged in sea water, the electrolysis will be very serious, and it is more likely than not this fact gave vent to the opinion that aluminum may not serve in motor-boat work. On the other hand, aluminum in motor and transmission cases is protected by the oil both in and outside and on this account sea water does not act upon it.

In carbureters this metal was widely employed some three years ago (1904), but it was soon found that in contact with liquid hydro-carbons a jelly-like consistency was formed that stopped up the openings and caused much trouble. It is not now considered desirable to employ aluminum for carbureter floats, and the author has abandoned its use for any part of carbureters, preferring phosphor or arsenic bronze.

Aluminum castings are made in both green and dry sand moulds, but the shrinkage is more irregular, making it always something of a problem to fix upon the shrink allowance for patterns. The exact shrinkage depends upon the alloying elements and the percentages of the components in the mixture. In general it is said an allowance of one-tenth of an inch to the foot will suffice. The best way, perhaps, will be to measure the like sizes of castings and allow accordingly, for in all truth there are several factors likely to influence the results.

In castings this product is prone to warp and cool, hence finish faces should be provided with a good thickness of "finish" metal, else castings are likely not to "clean up."

Much of the early talk about the extraordinary qualities of aluminum were no doubt due to the strength developed in aluminum-bronze, which product holds from 90 to 97 1-2 per cent. copper and the remaining content is aluminum, barring some slight impurities. Aluminum-bronze, then, is a high copper

alloy and has a high specific gravity to match; hence, alightness of aluminum castings as used for automobile work is conspicuous for its absence.

Aluminum has many valuable uses, besides, in casting: automobile parts, as for electrical conductors, aluminum-b parts, as before stated, and steel-aluminum for many purposes body facings, etc. In the manufacture of steel, aluminum an important part, in that small doses of it, when added to "teeming mass," prevents the included gases from remaining in the steel, hence the ingots are made more solid and perfect has been found that as little as from 2 to 8 ounces of aluminum to the ton, added in the ladle, renders steel ingots far smoother and perfect than the ingots would be in the absence of such a slight amount of this material.

Cast aluminum bodies are at present quite prevalent, they have numerous possible advantages, among which, however, low cost may not be found. The future bodies for automobiles can scarcely be in the direction of aluminum for various reasons, at least, viz.:

(a) Aluminum is non-dynamic in the extreme.

(b) The aluminum supply does not equal the requirements of bodies not considered.

While bodies do not require dynamic properties in the materials used to any noticeable extent, yet, even so, no one would suggest using glass for body work. True, cast aluminum is less brittle than glass, but it is far more brittle than sheet aluminum and the weight of cast aluminum in body work is something that has to be taken into account.

There are diverse ways of making light, strong bodies without casting them in aluminum, and most makers seem to prefer to resort to the other methods. Of course, cast aluminum bodies are far better than some wood bodies with open joints stuffed full of putty, and for that matter cast bodies are not as light as aluminum bodies with plaster of Paris as a backing or large aggregations of wood for framing and elsewhere. At all events, if cast aluminum bodies are lighter than some other bodies not employing cast aluminum, it is because the other bodies are not properly made.

# HOW FAR SKIDDING IS DUE TO ROAD SURFACES\*

By DOUGLAS MACKENZIE, M.I.A.E., A.M.I., M.E.C.H.E.

THE construction of roads from the point of view of the skidding to which self-propelled vehicles would be liable necessitates some study of the phenomena of skidding. Under normal conditions the wheels of the vehicle are supposed to roll on the road surface, the actual point or line of the periphery in contact with the road being quite stationary. Under such conditions the smoother the tire, and the smoother the road, the more would be the resistance to rolling action. This would be exactly true if there were no forces acting on the wheels, but the point of fact there are numerous forces, and these are the cause of all the troubles in actual practice. With a wheel that is not driving the vehicle, there is the friction at the hub, which tends to prevent it rolling freely. The driving wheel, on the other hand, has forces exactly opposite trying to force the wheel to roll faster than the actual rolling, but immediately the driving forces, and the brakes are applied, exactly the reverse forces are acting. Again, the steering wheels have to resist the tendency of the vehicle to travel in a straight line, and there is a force tending to push these wheels sideways when they are steered through an angle. Lastly, there is the force of gravity, which is of no moment, so long as it is at right angles to the road surface, but is very important when the road surface is inclined. The existence of this force renders it necessary to obtain considerable adhesion between the tire of the wheel and the surface of the road, so that there shall be very great frictional resistance to any rubbing of the tire over the road surface as opposed to free rolling. This adhesion must not be hindered by any stickiness, which would prevent the tire from rolling freely from the road as the wheel rolls forward; it must be purely friction between the actual surfaces of contact. The pneumatic tire introduces some further problems, but it is not necessary to consider them separately, but from the foregoing observations it is clear that a finely roughed surface is necessary to produce the required friction. Therefore, the primary necessity in selecting a material for a non-skidding road is to have a road surface composed of two or more substances, differing in the degree of hardness, but these materials must be finely divided that the road is sufficiently smooth for perfectly free rolling. The coefficient of friction on such compound surfaces is very high, amounting to as much as .8, but another consideration of equal importance is that none of the substances of which the surface is composed should be able to form a grease or lubricating substance under attrition of traffic.

## Granite Road Surface and Its Advantages.

Granite is an ideal substance for this purpose, because it is composed of crystals of different materials differing in their degree of hardness, but it is impracticable to make roads of granite perfectly monolithic—that is to say, in complete slabs—the full width of the road. In order to make it practicable to construct a granite road, the material has to be divided into blocks of a sufficient size for convenient handling. The most perfect granite surfaces are to be seen in Hamburg, where large setts are used, cut with extreme accuracy, so that the surface is perfectly flat, and the joints are so small as to be practically indistinguishable. This is quite a different class of road to the granite-sett roads in our English towns, where the surfaces of the individual setts are very much rounded, and the tires of wheeled vehicles, instead of rolling smoothly, have to bounce from sett to sett. Granite roads made with perfect setts are almost noiseless, the only sound being due to the hammering of horses' shoes, and as this antiquated form of haulage is rapidly reduced, the noise will be inappreciable.

An approximation to this form of granite surface—very much cheaper—is that employed on many of the German country roads,

\*Read before Royal Automobile Club of Great Britain and Ireland.

and which is known there as "Kleinpflaster." It is introduced into this country under the title of "Cubette Paving" or "Durax Paving," and is composed of small setts laid at random, and broken by special machines to about 4½-inch cubes. As the joints are none of them square to the direction of motion, the wheel is always riding on two or more of them, and does not jump from sett to sett. Consequently the wear on these setts tends to smoothen the road instead of roughening it as with common town setts.

## Materials Suitable for Treating Granite Surfaces.

Next to the first-class quality setts employed in Hamburg, the best surfaces are obtained by breaking granite to about 1½-inch cubes, and binding it by means of an elastic matrix. It is, however, necessary to remember that the interspaces between the pieces of broken granite should be very small, and therefore the 1½-inch granite should be mixed with some ½-inch, some ⅜-inch and some granite dust, so that the quantity of matrix required is very small, and the joints between the pieces of granite in the road surface will never be more than ⅜ inch under the most adverse circumstances. There seems to be a great difficulty in getting tar to adhere to granite, and so the tar has to be treated by distillation, and also by the addition of various substances so as to considerably alter its nature. There are half-a-dozen such materials now on the market, and they will not only adhere to granite, but they are unaffected by English temperatures and do not become soft in summer and brittle in winter, as is the case with untreated tar. These materials give an exceedingly good surface from the non-skidding point of view, because not only do you have the advantage of the compound nature of the granite, but you have the addition of another substance of a different degree of hardness in a sufficiently fine state of subdivision to give you the ideal roughened surface. It is also practical with such a matrix to use limestone in a state of fine subdivision where limestone is much more easily obtained than granite, but this is not quite such a suitable substance, as finely-ground limestone has certain lubricating properties; and therefore the mud arising from this surface in wet weather makes a nasty, slippery grease.

Great objection is raised by some councils to the cost of improved roads made on this system, especially for country roads, but it must be remembered that a great deal of the deterioration of country roads is due to the effect of weather instead of traffic, and if a thoroughly waterproof road is constructed in the first instance it is absolutely weatherproof, and therefore does not deteriorate from any other cause than the attrition of passing traffic.

## Proper Camber of Road Surfaces Very Important.

I have already mentioned that one source of skidding is due to the action of gravity when the surfaces are inclined, and with a properly waterproof surface the water will run off with much less camber than the old-fashioned roads. Probably a camber of 1 in 50 will be quite sufficient for these roads, and therefore the skidding due to the pull of gravity towards the gutter need not be at all a serious matter. The mistake has been made in some parts of the country of adopting waterproof roads with the same road contour as that previously in use, but one of the great advantages of modern materials is the reduction of the camber which they will permit.

To make a cement for cast iron take 16 ounces cast-iron borings, 2 ounces sal ammoniac and 1 ounce of sulphur; mix well and keep dry. When ready to use take one part of this powder to 20 parts of cast-iron borings and mix thoroughly into a stiff paste, adding a little water.

# PRACTICAL HINTS FOR THE AUTO OWNER

**A**FTER a certain length of service, the cylinders of an automobile have a tendency to ovalize, says *Omnia*, owing to the movement of the pistons causing pressure on two opposite points. Naturally the piston rings ovalize at the same time. If, after taking down the cylinders, the rings are put back in exactly the same position, no inconvenience will be felt from this

TO REMOVE AN OBSTINATE NUT.

uneven wear, for the cylinders will not be losing compression. Some conscientious constructors use a stud which prevents the piston rings turning. It is an excellent precaution. But this does not prevent the piston rings being transposed. As the ovalization of a cylinder by usage is far from being symmetrical, care should be taken to mount the rings in the same groove and in the same position as before. Neglect to do this is frequently a cause of loss of power.

### What to Do When a Nut Cannot Be Moved.

Sometimes a nut is so solidly rusted to a bolt that it is impossible to move it by ordinary means. To force it with a wrench would only result in

### Two Views on the Possibilities of Cast-iron Valves.

Whenever it has been attempted to replace steel for cast iron in cylinders, piston rings, etc., it has been found that the steel wore out much more rapidly than cast iron. Of all metals cast iron is the one which best resists the action of heat. Steel and bronze, used in cannon or on gas and steam engines, will not resist the erosive action of gases passing at high speed; cast iron, on the other hand, is never subject to erosion, unless chemical agents are present. The use of cast iron for cylinders and valves is to be recommended. Care, however, should be taken in its selection in view of the work it has to perform. Experience has shown that on automobile motors steel valves deteriorate quickly, while cast iron seatings resist and give good service.

Another view on the subject by a French constructor writing to the same journal is that cast iron valves rarely corrode or become pitted, only need grinding at long intervals, and are exceedingly gas tight. The reason why they are not generally employed on automobiles is owing to the difficulty of attaching them to the valve stem. On slow speed stationary engines they give satisfactory results, but will not hold together on high speed automobile engines. In addition, cast iron valves are heavier and thicker than steel ones, thus reducing the power of the engine to such an extent that there is little possibility of their use extending beyond the domain of stationary engines.

### Where the Chauffeur-Mechanic Can Best Attend to Business.

Placing the chauffeur on a small seat hanging over the left running board, with his feet on the latter, is becoming more and more common among European automobilists who drive their own cars and object to placing the mechanic in the tonneau whenever a friend is carried on the left front seat. Certainly it would be impossible to find a position in which the mechanic

is more conveniently placed for attending to the motor than a spider over the running board. A simplification of the European mechanic's seat was noticed on a large Italian car in New York garage recently. Hinged outwards from the left hand side of the car was a simple padded seat supported by a couple of metal legs to the running board. When not in use the seat folded inwards under the feet of the left front passenger. To secure the mechanic from being thrown out by a broad strap could be clipped onto the dashboard and a handle on the side of the car body. When not used the ordinary layout of the car were in no way changed.

### How One Owner Found a Substitute for a Bolt.

A novel makeshift repair when a 10-12-horsepower two-cylinder car shed the bolt holding the universal joint between the axle box and cardan shaft is described by a writer in *Autocar*. The owner found that he had no bolt near the size, and it was some miles to the nearest town where one could be obtained. After a little thought, he found a way out of the difficulty in the following manner: The sprag wire was cut, then threaded three times through the bolt hole, the ends afterwards being displayed and bound up securely with copper wire. With car driving he was enabled to complete his journey.

### Automobile Pits Within the Reach of the Amateur.

Constructing the ordinary type of dugout automobile pit is an undertaking that the average autoist hesitates to take. One substitute occasionally seen on private garages consists of a couple of parallel rails, mounted on stout supports, about four and a half feet from the ground, and of sufficient length to suit the wheelbase of the car. By as gentle a gradient as space renders possible, one extremity of the platform is connected to the ground by stout rails. A winch fixed up at the opposite end of the platform allows a car to be drawn up with ease, a ratchet being fitted, to be held at all points in perfect safety.

Another type of substitute pit easily constructed by the amateur is described by an English writer in *Autocar*. "It is constructed, as may be seen by the accompanying photographs, as a sort of pier off the hillside on which our stables stand,

AN EASILY CONSTRUCTED AUTOMOBILE PIT.

will take any size of car. It could be easily protected by a light roof if desired, and when so covered in it would be bright light to work in, even in dull weather. The following are the dimensions which I have used and have found satisfactory after three years: Length of rails, 12 feet; width of rails, 11 inches between inside of raised edges; thickness, 4 inches; track, in measurement 3 feet 2 1/2 inches, outside 5 feet 4 inches; height of track at outer end of rails, 4 feet 4 inches above pit floor;

th 4 feet 5 inches, length 9 feet, including step; step is 1 foot inches high and 2 feet 4 inches from back to front. The supporting uprights at the outer end of the track are 10 inches diameter; both rails and uprights are of pitch pine, painted. A buffer at the end is shown covered with sheet zinc to protect from the wet; the zinc covers for the rails have been removed. The lean-to shown is the motor house adjoining the rails. A cinder path round the pit allows of free movement of cars. Both the pit and the step are floored with paving stones, and sloped slightly towards the front towards a drain provided to carry off the water."

**Current Leakages Through Insulation.**

When overhauling a single-cylinder machine a short time ago, to determine the cause of the engine not firing—although the trembler, which had been giving trouble, was buzzing merely—we accidentally moved the high-tension cable slightly when the double buzz was heard, says *Autocar*. One was the metallic rattle of the trembler, while the other was a sharp, short spitting, clearly indicating that a fault in the cable insulation was allowing the high-tension current to short to earth, the flaw being readily closed up to the engine. As no spare wire was carried, the cable was taken down and reversed, that is to say, the coil end originally connected to the plug, while the end that was originally connected up to the plug was connected to the coil. This arrangement brought the fault in the cable to such a position that it was quite clear of the engine, and, consequently, being unable to short to anywhere, the current resumed its correct path through the plug. The difficulty of tracing this derangement is due to the fact that when trying to start the engine the jolting of the high-tension cable so that a short could occur, which it was for the same reason inaudible. When, however, the contact maker was put on contact, and the switch put on, the double buzzes were immediately heard, but not till after the accidental moving of the high-tension cable, which brought the short circuit into operation, and the dismantling of the carbureter to prevent a possible stoppage of the jet. The time on the latter job, however, was well repaid by the improved running of the machine, as both the float and jet chambers were found in need of attention.

**Slow Working of Tremblers May Cause Misfiring.**

Some tests which have recently been made with induction coils show that misfiring at high speeds is due to the slow action of the trembler blades, and not to faulty carburation. Only the most rapid action coils should be used to get the most satisfactory results from an engine.

When a coil trembler persists in sticking, the trouble will often be found in the small helical vertical spring which keeps the trembler blade up against the platinum-tipped screw—that is, of course, if the coil is fitted with a trembler of the pattern. If the trembler screw is readjusted and this spring slightly elongated, it will be found to give a more vigorous action to the trembler.

**STORAGE AS A SAFETY OF ALCOHOL.**

Alcohol as a fuel has certain advantages over gasoline in the matter of storage, says *The Iron Age*. If a can of gasoline be opened near a flame, it is likely to explode by the ignition of its vapor. This could never occur with alcohol. Then, again, water is useless to quench burning gasoline, serving only to spread the fire by floating the burning liquid. Alcohol can never present this danger, for it mixes with water in all proportions, and in so doing becomes non-inflammable. In the use of the fuel in submarine vessels, or other hazardous places, the superior safety of alcohol might lead to its ultimate adoption. Its advantages in this respect in such unusually hazardous places must also fit it for use as an automobile fuel without equal; that the risk of fire and explosion on the car is no small item can readily be appreciated from a review of the number of such vehicles that have been destroyed in this manner during the past few years.

**THE AUTOMOBILE CALENDAR.  
AMERICAN.**

**Shows and Meetings.**

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Oct. 31-Nov. 7...—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6...—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, Secretary, 184 La Salle Street.
- Nov. 30-Dec. 7...—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., Jal Alai Building, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4...—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.
- Sept. 7.....—Minneapolis, Minn., State Fair Race Meet of the Minnesota State Automobile Association.

**Races, Hill-Climbs, Etc.**

- Aug. 17.....—Newark, N. J., Olympic Park, Carnival of the New Jersey Automobile and Motor Club.
- Aug. 31.....—Philadelphia, Race Meet under auspices of the Quaker City Motor Club. (Track will be either Point Breeze or Belmont.)
- Sept. 2.....—Harrisburg, Pa., Race Meet of Motor Club of Harrisburg (probably Middletown track).
- Sept. 2.....—Chicago, Harlem Track, Race Meet under the auspices of the Chicago Automobile Club.
- Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.
- Sept. 14.....—Jamestown (Va.) Exposition, Aeroplane Contest for "Scientific American" Prize.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Sept. 20.....—Milwaukee, Wis., State Fair Grounds Track, Race Meet, Milwaukee Automobile Club and Milwaukee Dealers' Association.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

**Motor Boat Races.**

- Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.
- Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

**FOREIGN.**

**Shows.**

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7...—Denmark, Copenhagen International Automobile Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1...—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Jan. 18-Feb. 2...—Turin, Italy, Fifth International Automobile Exposition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

**Races, Hill-Climbs, Etc.**

- Aug. 23.....—Belgium, Ostend Motor Boat Meeting.
- Aug. 11-29.....—France, Coupe de Auvergne.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.
- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chateau-Thierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gallion Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.
- July 14, 1908....—Paris to London, Aerial Race.

## LETTERS INTERESTING AND INSTRUCTIVE

### DATA WANTED FOR AN AIRSHIP ENGINE.

Editor THE AUTOMOBILE:

[853.]—I have read a great deal of valuable information concerning automobile engines in "The Automobile," and wish to know if you can give me some help on an engine that I am planning.

This motor must be as light as possible and produce a great deal of power. I have planned an airship, and as soon as I can get out the design of a good engine I intend to build it. I wish to have an engine of about 40 to 50 horsepower, if possible. I intend to make it with eight cylinders and of the horizontal type, and would like to have the best dimensions possible for the cylinders so as to get the highest speed out of them. Kindly give me the best dimensions for the cylinders, crankshaft, piston, stroke of piston, intake valve, exhaust pipe and all the other parts of the engine. Also the best kind of material to use for the crankshaft, etc., thickness of the cylinder castings, and the like. It is to be an air-cooled engine, and as simple as possible.

I am only 17 years of age, and have been trying to get this information for some time before I came across "The Automobile."  
Chicago, Ill. **FREDERICK G. GRIME.**

Without wishing to discourage you, we think by far the best advice we can give you regarding the building of such an engine is that of the philosopher regarding matrimony. Don't. More would-be aeronauts who think they have solved the problem of aerial navigation have had their hopes wrecked on the reef of a homemade motor than it would be possible to count. Whether there was ever anything in their ideas of an airship could not be told, because the motors they had built would never work, or at least not long enough to show whether the idea was of any value or not. And by "homemade" in this connection we do not necessarily mean motors that the aeronauts have constructed themselves, though we presume that is your intention, but engines which they planned and had built for them.

If your idea of aviation is of any value, go ahead and build it, and leave the building of the motor to people who are not only familiar with it, but who have the facilities for doing such intricate work. There are several makers in this country who devote a great deal of attention to the building of air-cooled motors for flying-machines, and you can buy such an engine complete and ready to run for a fraction of what you could either build it yourself or have it built for you. Then, a year or so later, when you have come to the sad conclusion that your idea of what an airship should be was not quite correct after all, you will have an engine that you can either use or get a fairly good price for if you wish to sell it—something that would not be the case if you built it yourself or had it built according to some startlingly original conception. The writer's personal experience extends to a case where an aeronaut who has been studying and experimenting for a number of years invested two or three thousand dollars in experiments of exactly the nature you have in mind. One was a six-cylinder, horizontal-opposed, air-cooled engine of the four-cycle type and the other a two-cycle, four-cylinder, horizontal-opposed motor, both of them air-cooled, and both of them as light and as powerful as it is possible to build a motor, theoretically. Though they cost more than \$3,000, they could probably be bought for \$30 to-day, if anyone could be found to bid that much. This is but one example of many of the same kind, which accounts for our going out of our way to tell you of it, rather than give you the dimensions asked for without comment.

### MORE INFORMATION ON REVERSIBLE ENGINE.

Editor THE AUTOMOBILE:

[854.]—Can you give me any further information regarding the reversible four-cycle marine motor described on page 136 of the issue of "The Automobile" of July 25, 1907?

New York City. **W. H. SCHOONMAKER.**

The only information we had concerning this motor was contained in the description of it which appeared in the German paper, *Die Yacht*, published in Hamburg, Germany.

### WHAT CAUSES THIS KIND OF TROUBLE?

Editor THE AUTOMOBILE:

[855.]—If it is not too much bother, will you help me out of some trouble I have been having for quite a long time? I have a four-cylinder, shaft-drive car with sliding gear transmission. Now I can throw into low, reverse, or high and not make a sound, but when I attempt to throw into second it can be heard for three or four blocks, and then I have got to shove on the lever as hard as I can. This car always did make more noise going into second than any other speed, but it is worse now. The teeth are rounded off as much on second as on any other gear, and of course the clutch comes out as much for second as when I throw into the other speeds. I have done everything I can and cannot fix it. Will be in hopes of getting a reply from you or some reader that will help me.  
F. R. ZEIGLER.

Oregon, Ill.

The fact that you have difficulty in engaging the pinions of that particular speed is indicative of a sprung shaft or similar lack of adjustment which prevents these two pinions from coming together as they should. Without a drawing of the gear-set of your car, or any particulars as to its design, it is difficult to say definitely just what can be afflicting it as you state. But there is no doubt that either the engaging pinion or the fast pinion of the second speed is not in its proper place, and the necessity of shoving hard on the gear-shifting lever to make them come together represents the amount of effort required to spring them into proper alignment so that they will engage. Take the gear-set down or remove the body of the car so that it will be readily accessible and test the shafts for alignment and also try the bearings for looseness. There should be no difficulty in remedying the trouble.

### SOME QUERIES REGARDING EXPLOSIVE ACTION.

Editor THE AUTOMOBILE:

[856.]—Will you be so good as to answer, to the best of your ability, through the Letters Interesting and Instructive column, the following questions?

1. Would it be possible for an engine to exhaust by the expansive force of its exploded gases through an outlet valve sufficiently to draw in an explosive charge by atmospheric pressure alone (piston not moving)?

2. If not, could the charge be forced into the chamber by compressed air, and what effect would the burnt gases remaining in the chamber have upon the explosion?

3. If an explosion with 60 pounds initial compression gives a pressure of 230 pounds, will not an explosion without compression give a pressure of 170 pounds? If not, why not?

Jamesburg, N. J.

**W. H. CONNERS.**

1. But little consideration of the conditions implied by this question is required to show that a plain cylinder, which we assume is intended by the expression "piston not moving," cannot exhaust itself through one valve as the result of an explosion so that a fresh charge will enter by atmospheric pressure alone through another. While the utility of exploding a charge in such a cylinder without imparting the pressure thus developed to a moving part and thus converting it into useful work is not plain, it may be assumed that the pressure developed by such an explosion reaches 100 pounds to the square inch. No data being supplied on the subject, it may further be assumed that the exhaust, or outlet valve, opens at this point of maximum pressure. The pent-up gases will rush out through this opening with great force at first, gradually diminishing until the remaining contents of the cylinder reach a pressure equivalent to that of the surrounding atmosphere, after which there will be no further action. As no depression or vacuum is created in the cylinder, the second valve cannot open by atmospheric pressure.

2. There is nothing to prevent forcing a second charge into the cylinder through the medium of compressed air, it being assumed that the exhaust valve has closed in the interim, and the only effect any burnt gases remaining in the cylinder would have would be that of weakening the subsequent explosion in a

measure dependent upon the proportion of burnt gas to fresh charge. Probably very few internal combustion motors on the market to-day, at least of those designed for automobile use, explode an entirely fresh charge at each power stroke—a fact that is readily apparent in the extra heavy impulse that results every time there is an explosion following one or two missed strokes.

3. If it necessarily followed that the only advantage accruing from a prior compression of the charge amounted to exactly the gain represented by the extent of this initial compression, as assumed by your figures, the compression type of engine as current to-day would not have marked such a tremendous advance over the constant-burning types such as the Brayton and Lenoir which it supplanted. Explosive pressures vary to a considerable extent in proportion to the compression, as well as to the difference in fuel value and the proportions of the mixtures. For instance, a properly proportioned mixture of gasoline vapor and air, when exploded in a closed vessel without any prior compression, has been found to reach as high as 90 pounds to the square inch. Owing to the greater difficulty in igniting an un-compressed mixture of either alcohol vapor and air or kerosene vapor and air, doubtless neither of these fuels would give as high a pressure under the circumstances, though kerosene is credited with a greater number of B. T. U. per pound than gasoline. The great increase in the pressures realized from a compressed mixture as compared with one not previously compressed, is due to a variety of causes. Pressure in this instance is synonymous with heat, and as the initial compression raises the temperature of the mixture considerably before it is fired, it will readily be seen that this is one cause of increase; then, the molecules or particles of air and gas are in far more intimate contact in the compressed mixture and less energy is required by the components of the mixture to bring about their chemical union. One of the chief causes is that, with high compression, the minimum amount of cylinder surface is presented to the heat of the explosion, and thus far less of the total amount of heat generated is wasted in the cylinder walls. This inquiry of yours brings up a question that was first definitely settled almost half a century ago by Beau de Rochas, who invented the principle of the four-cycle engine of to-day, in 1862, though the idea was not practically applied until Otto's invention of several years later. While not strictly analogous, the action of gunpowder when fired in the open air and when fired in a gun or as a blast, furnishes the most striking illustration of the advantages of compression. In the former case, even a large quantity of powder will not produce more than a puff, but confined in a cartridge or in a hole drilled in rock, a comparatively small quantity is required to develop a tremendous amount of energy.

#### INFORMATION ABOUT DOUBLE-ENGINE CARS.

Editor THE AUTOMOBILE:

[857.]—I would like to know if there is a car built that is equipped with two engines, each independent of the other, or is there a car that has both a gasoline motor and a steam engine on the same chassis?  
JAMES T. EDWORTHY.

Flandreau, S. D.

There is a car built in this country with two independent gasoline engines. It is known as the Carter Two-Engine Car. We have never heard of a gasoline motor and a steam engine being used on the same car.

#### IS THERE A SPARK-PLUG STANDARD?

Editor THE AUTOMOBILE:

[858.]—Will you kindly inform me if any steps have been taken toward standardizing the diameter and pitch of the tapping for spark plugs used in automobile construction? If so, where can I obtain the data respecting such action?  
C. R. HARRIS.

New York City.

The Mechanical Branch of the Association of Licensed Automobile Manufacturers took up the matter of standardizing spark plugs early this year, and, after considerable deliberation, adopted a plug 7-8 inch in diameter, 18 threads to the inch, the latter,

we believe, being the U. S. standard. Coker F. Clarkson, in charge of the publication department of the association, 7 East Forty-second street, New York City, will doubtless supply any further information desired. These plugs, known as the A. L. A. M. standard, have now been on the market some time and probably can be bought of the majority of supply dealers.

#### MORE LIGHT ON THE SUBJECT OF ALUMINUM.

Editor THE AUTOMOBILE:

[859.]—The somewhat petulant letter of Mr. Birdsall, in your issue of August 1, would indicate that aluminum was in grave danger, but a real serious engineer should have located the trouble with those gear boxes in short order, very easily.

I enjoyed Mr. Blough's article, and there was a good fund of information in it; he cited the properties of various alloys, and that was all he should do. The only thing he could do in addition would be to give the percentages of the metals in the alloy; this would be dangerous, as there is not one chance in a hundred that they would be mixed right, and the value of the resulting alloy turns on this point. Take the same amounts, of the same metals, and mix in a different order, at a different heat, and cast; the chemical analysis of each result will be the same, but the grain of the alloy, the elastic limit and the tensile strength, will be different; one will be weak and the other strong, one brittle and the other elastic, one will give good service and the other is of no value.

Bearing this in mind, every serious engineer should thank The Pittsburg Reduction Company for the pains taken to give us aluminum alloys, properly mixed, in ingot form, and there is no good excuse for poor results with them; the one and only requirement at your end is to simply KNOW HOW to handle the foundry.

Mr. Birdsall wants the composition of an alloy. Here is a very good one of the rigid class: Aluminum 800, tin 20, zinc 150, copper 20, manganese 5, iron 5. Have this made by a person who knows how these should be mixed, and it will make a very strong metal, but I hardly think the Funk Foundry would get there.

If Mr. Birdsall will simply order his ingots from The Reduction Company, and cite his conditions fully, they will give him the proper metal. If he will see that it is melted in a plumbago crucible—a charcoal fire is the better—a coke fire is all right if you use 72-hour coke, but do not use 48-hour coke, or gas coke, see that the metal is not heated above a cherry color, have the molds gated properly, as aluminum requires much more study than iron on this point, aim to have the heavier sections at the top, where they will cool last and feed back from the risers, use large risers and have them large close down to the sprues, and it will be an easy matter to get good strong castings that will do the work expected of them.

Don't let the foundryman get scared because he thinks this metal is too cold to run, a few heats will convince him, and remember that to overheat aluminum is to ruin it every time.

Aluminum is in its most fluid state just before it starts to congeal, then comes a time when it is very rotten, and slight strains cause flaws; and this fact, coupled with the fact that both nitrogen and hydro-carbon gases are especially liable to be absorbed by slightly overheated aluminum, making porous castings, will account for much of the trouble with this metal.

It is unfortunate that Mr. Fay made some of the remarks that he did regarding aluminum in his article of June 6. They are quite correct for an alloy such as he cites, but the chemical analysis tells the story; it is an art alloy, a brittle, crystalline, gray-white metal, which would run very liquid and be fine for casting tin solders or small images, but of no earthly value in mechanics. He cites the values given in the Lake articles as impossible; but I should expect them to be readily attained. If I had a foundryman who had been given the proper alloy ingots and he did not turn out castings which would test as high as the Lake test No. 2, there would either be a change in short order or a new man.

In "The Automobile" of June 13, Elwood Haines gives aluminum a value of from 20,000 to 30,000 pounds. He has had quite a little experience with it, as he has been with the auto since its first baby days, and his machines stand up.

In short, for general auto work we have two alloys, nickel aluminum with an elastic limit of 8,000 to 12,000 pounds, ultimate tensile strength of 15,000 to 28,000 pounds, reduction of area 6 to 8 per cent., specific gravity 2.85, and moduli of elasticity 11,500,000 pounds; this would be used in cases where we wished a metal which would give before rupture. For cases where we can use a rigid metal, we can use zinc aluminum, or Sibley metal; these metals can be made as strong as good grades of cast iron, they are easily worked, take a fine finish, and do not give the trouble with cutting tools that the nickel alloy does.

The weak point of aluminum is not tensile stress, it is compressive stress; as the nickel aluminum cited above, under compression, will have an elastic limit of only 6,000 to 10,000 pounds, and an ultimate strength of only 16,000 to 24,000 pounds, and this for columns only 2 diameters long. It is so very rare to find a metal

that is weaker in compression than in stress that there may be some excuse for a neglect to give the matter proper consideration. We are not quite serious enough.

Everyone is not aware that it only requires 51.4 heat units to melt a pound of aluminum, the same number that would heat a quart of water 24.7 degrees.

EDWARD F. EDGECOMBE.

Cuyahoga Falls, Ohio.

**SOMETHING ABOUT TEST-PROOF LENGTHS.**

**Editor THE AUTOMOBILE:**

[860.]—Edward F. Edgcomb, in his communication (No. 845), in commenting upon the testing of materials, states, among other things, the following: “\* \* \* and it is hard to understand why some persons in the automobile industry are so ready to ignore the fact which the experience of years has taught. We test materials to secure facts, and it has been found that short pieces are

FIG. 1.—Specimen of standard international test-proof.

misleading, the eight-inch test piece has become a standard. We must not lose sight of the fact that when a test piece has been pulled, it never pulls evenly, its main elongation and reduction take place in a space of about two inches in the center of the specimen. This being the fact, it is readily seen that a four-inch test piece gives a wrong percentage of elongation.”

Mr. Edgcomb will find it extremely difficult to sustain any part of his statements as quoted above for reasons, viz.,

- (a) Standards become obsolete as fast as new standards take their place.
- (b) The present general practice is to use test specimens as set down by The International Society for Testing Materials—see Fig. 1—and among those who have for a considerable time used this standard are the United States Government, the Association of Licensed Automobile Manufacturers, numerous steel mills, many laboratories, authorities in general, and some persons in the automobile industry to boot.
- (c) The elongation and reduction of area would not be wrongly expressed on a four-inch test specimen, any more than it would were an eight-inch specimen used or for that matter a two-inch specimen, but one would not be warranted in comparing results as obtained on a proof of one length, with results as realized from another, unless one knows how to adjust for certain differences brought about by the fact that the elongation has two components, i. e. (1) the uniform elongation in proportion to length between enlargements; (2) the subsequent local elongation. The subsequent local elongation depends upon diameter, while the proportional elongation depends upon length.
- (d) Rupture does not necessarily take place at the mid-distance between enlargements, but at the weakest point, and the local elongation, as well as the greatest reduction of area, will be in the zone of rupture.
- (e) The International “proof” obtains for all steel work, of a nature enabling one to turn a specimen of the desired dimensions from the material to be tested, and as this test-proof or specimen, is the smallest of all so far generally used, it enables one to cut a “cupon” from a part to be investigated, even if the part is quite small. Plates of course, cannot conform to this requirement unless the plates are over one-half inch in thickness, and in plate

FIG. 2.—Contraction at point of rupture.

work for boilers, etc., it is not uncommon to tal distance six inches between enlargements.

- (f) Figure 2 illustrates the local contraction when an inflection test specimen is pulled to rupture, and for diameters, considering precisely the same material in case, length would not alter this phase of the test, but uniform elongation takes into account the length between enlargements, and is, of course, a function of length. In products as cast iron or aluminum, in which the phenomena of local contraction is absent, the distance between enlargements might well be, and generally is, eight inches, the object being that of enabling one to realize real values, since without local phenomena the elongation per unit length is but slight.
- (g) Sudden changes of shape, grooves, shoulders and irregularities of any sort between enlargements would have a marked effect on the readings, and it is to such one might look for false accounts.
- (h) Suddenly applied loads during test would augment the variation readings, while tensility might show greater elongation prolonging the time of test.

In conclusion, then, the distance between enlargements of test specimen can be mostly anything between, say, two and six inches, and still show the strength of the material; but comparison is best made if the length is common for all test specimens, where error can result from methods not mentioned by Mr. Edgcomb. New York City. THOS. J. I.

**WHAT IS THE CAUSE OF THIS FLOODING**

**Editor THE AUTOMOBILE:**

[861.]—I have a Schebler carbureter and have trouble with flooding. I put in a new float and do not think the priming is too long, as it does not always flood. Some times after I start it awhile, it will be all right, and then again my gasoline runs over the street. I have come to the conclusion that the trouble is dirt, and thought of putting a strainer on in the feed pipe. You think that will fix it? I notice an ad of the Hatcher Strainer in your paper, on page 70, July 4 issue, which I thought I might mention. Oakland, Cal. J. F. McMAHON

There appears to be little doubt, from your statement, that the nature of the trouble, that the latter will be found to be some derangement of the float valve and not at all to the float you have supposed. A strainer is an excellent precaution, but I do not think dirt is the cause of the trouble. The float valve of a Schebler carbureter is of the annular type, surrounding the float chamber, and unless you found that the old float had become clogged or so heavy as to float much below its accustomed level there was no necessity of replacing it. The valve gear is found attached at a point on the circumference of the float in the shape of a short arm, to the end of which is attached the shutting off the flow of gasoline when the float reaches the determined level. It is the failure of this valve to seat properly that causes the flooding and the intermittent nature of the trouble is due to the fact that it is only at times that the valve does not work. Examine all the parts carefully and see if either the float or the vertical rod is not slightly bent, or if any of the connections have worked loose, as the amount of movement necessary is so slight that very little derangement is needed to prevent the proper working of this part of a carbureter. Doubtless in your case the trouble is slight, and as long as the car runs over smooth roads it does not appear, but as soon as it is subjected to a more or less severe jolt the parts are jarred out of place with the result that the float does not do its duty by closing the valve. If an examination does not disclose the defect, compare it with a new Schebler or communicate with the makers.

**A TIMELY WARNING FROM PENNSYLVANIA**

**Editor THE AUTOMOBILE:**

[862.]—Notify all tourists that expect to come over the New York Pike from Wheeling east, that at Brownsville, Pa., where the crossing the Monongahela river is carried on a toll bridge, the authorities await their arrival, and if not supplied with Pennsylvania license tags, they are promptly charged \$10 for the order taken for the tags at \$3, with a necessary hold-up of several days, or arrangements may be made to have the tags delivered at the objective point, to be ready for the return trip.

As this point is 10 miles in from the State line, there is no escape of the fine, so it will be less trouble and cheaper for the tourists to arrive here fully equipped with the legal requirements. Brownsville, Pa. ALFRED C. SMITH,

**NOVEL FORM OF SPRING SUSPENSION.**

Under the title of the Burgess double-tension spring, there has been invented what may most aptly be termed a combined springs and shock absorbers for the purpose of improving vehicle suspension. While this will serve to give a rough general idea of the construction of the device, which will further be made clear by reference to the drawings showing a front and side view of this type, there are a number of other differences which will serve to place these springs in a class of their own, and the following description written by the inventor himself, Charles Burgess, Jr., Wenona, Ill., will best suffice to make these numerous points clear:

Referring particularly to the drawings, the axle (15) of the vehicle in which the wheels thereof are secured is attached to the main spring (20) by means of the plates (14) and clips (13), which are of the common form of construction. The spring (20) consists of a center leaf as shown, with laminations secured thereto on either side, the number of laminations depending entirely upon the deflection required, which is determined according to the static load of the car body or the maximum weight of the car body, according to the preferred form of computing what the strength of the spring should be. The laminations being interposed on either side of the main or central spring (20), I provide the same with vertical guides, which are formed integral therewith and on each

DETAILS OF THE BURGESS DOUBLE-TENSION SPRING.

side of the main spring, through which vertical guides are slidably mounted, and roller eyes (12) at each end thereof in which the roller bearings are journaled and are normally in contact with the upper and lower leaves. When the spring is deflected there is a movement of the laminations, either forward or backward, longitudinal movement of the main spring, and by the employment of the vertical guides (10) the laminations or leaves are kept in alignment during movement and are greatly assisted by the roller bearings, thereby eliminating the friction between the leaves to a great extent. The depending hangers (18) are not preferably constructed, as the cylinders may be secured either above, below, in center or on either side of same, but in the drawings they are secured above, between the depending lugs, with bolts (16), which pass through the hangers at the lower portion of the depending hanger (18) as shown, as well as through the aperture formed integral with the cylinder head. This construction gives the cylinder a free, vertical, sliding movement between the lower portion of the depending hanger (18), thus eliminating all friction of working parts of the suspension, the longitudinal axial line of springs and buffer springs being in the same horizontal plane. The cylinder (17) and head are cast in one, with the head aperture to receive a packing gland (7), through which the piston rod (6) is adapted to pass. The caps of the cylinder, containing a male thread, are secured to the ends thereof by means of a female thread within the cylinders. Adjustably mounted upon the piston rod (6) is the piston (1), the adjustable feature being accomplished by means of the piston rod being threaded as shown and adapted to cooperate with a bore provided with a female thread within the cylinder. The piston is provided with a cross sectional slot for the purpose of containing the key, which passes through and is secured by the apertures in the piston rod (2). Interposed between the piston and cylinder-head of the cylinder is the buffer spring (3) the size of the buffer springs being governed entirely by the

end tension sought to be procured to the main spring (20). Each cylinder is provided with an oil plug (9) in order that oil may be inserted, not only to serve as a lubricant, but also to act as a fluid brake therein. Each cylinder is completely filled with oil, and upon the forward or backward movement of the piston the oil is forced on either side thereof through the longitudinal aperture (4), thus giving resistance to the piston according to its movement, allowing the spring to move quickly when idle and slowly when working; that is, it absorbs the jars in the movement of the piston instead of transmitting them into a series of jumps to the body of the car. The piston rod (6) of each cylinder extends out and beyond the cylinder head and is provided with a slot (21) adapted to co-operate with the center leaf at each end of the main spring, and is constructed so that the piston rod (6) and center leaf of the main spring are solidly secured together by means of the bolts passing through the end of the center leaf of the main spring, this being suitably apertured, thereby preventing any vertical or horizontal movement between the piston rod and the center leaf of the main spring relative to each other."

From the foregoing it will be apparent that, while the springs themselves differ in a great many detailed points from those in current use, the invention is practically a combined spring and shock-absorber.

**WHAT ONE AMERICAN LEARNED ABROAD.**

Emil Grossman, president of the Motor Car Equipment Co., the National Sales Corporation of New York, and the International Sales Corporation of Paris, who left for an extensive European trip May 23, recently returned on the *Kronprinz Wilhelm*. Mr. Grossman made exclusive selling agencies in France, Italy, Germany, England, Russia, Sweden, Denmark, Belgium and Holland for the line of goods handled by the National Sales Corporation, and also made advantageous arrangements with several European manufacturers for representation in America.

"The automobile outlook in Europe is exceedingly good," says Mr. Grossman, "particularly in the manufacture of commercial vehicles and taximeter cabs. The industry in these lines is becoming enormous; practically every large mercantile house, as well as factories, and more particularly breweries, are employing these trucks. The gasoline trucks are growing in favor, although a large number of electric trucks are also manufactured. Several of the automobile manufacturers have orders for thousands of taximeter cabs to be delivered within the next two years. As a rule, the taximeter cabs are light in construction, of medium horsepower and very easy to control. They are well patronized everywhere, costing only about 10 to 15 per cent. more than the horse cab.

"A very large number of touring cars are being rented by visitors for trips of one to three weeks at an expenditure of 100 to 125 francs per day (\$20 to \$25), which includes all expenses of machine, supplies and driver. Considering the annoyance caused to foreigners who do not understand the customs regulations of the different countries, and the expense of tires, benzine (which costs nearly three times as much as in America) and other expenses, this new method is a pleasant and less expensive form in which to tour than to use one's own car. The machines are insured against accident by the companies renting them. The company doing the largest touring car business in France is the Co-operative Association of Chauffeurs, each driver being a stockholder in the company; and, naturally, the drivers are careful not to meet with accidents or to expend large sums for tires and supplies.

"In every factory of any size American machinery is employed. In one of the largest factories visited, out of 1,680 machines in use over 1,200 were of American manufacture. The German manufacturers, however, are making great inroads on the American manufacturers of automatic machines, and unless radical improvements are made in America the German manufacturers are sure to capture a big share of the automatic machinery trade in Europe."

## Uniformity of Europe's 1908 Racing Conditions Finds General Favor

**A**FTER a sufficient interval to realize the full import of the unification of race conditions decided upon at the Ostend conference, European constructors and automobilists express themselves as satisfied. The leaders of the industry are not absolutely united on the best working basis to improve the breed of automobiles and give interesting racing, but they are all convinced that the conditions for 1908 are infinitely better than the muddle of the past two or three years. A few French automobilists try to belittle the work of the conference by pointing out that, although every motoring nation, except America, formally agreed to the new conditions, none of them is bound to put the laws into practice, and the multiplicity of conditions in 1907 may continue in 1908.

Mervyn O'Gorman, a British delegate, while approving the decision of the conference, believes that full liberty in construction may lead to progress at present believed impossible, and offers an "O'Gorman No-limit Trophy" to be competed for annually over not less than 100 miles on the Brooklands track. It is obvious, however, that the conference conditions will predominate next year. A few organizing bodies may conservatively stick to their present rules, only to find, when it is too late to remedy the evil, that manufacturers do not build cars for their own pleasure and prefer to produce racers eligible for the largest number of events.

An example of the evils of multiplicity in automobile race conditions was shown in European motor-boat events a couple of years ago, when an interesting sport became the laughing stock of the world and received such a blow that it is yet in a sickly condition.

This year there have been three limited-fuel races in France, with 30, 15 and 19 liters to the 100 kilometers; two in England on different allowances of gasoline; special conditions for the Targa Florio, the Ardennes circuit, and the German Emperor's race. One more meet, on the Brescia circuit, has yet to be held, with two distinct conditions. The Vanderbilt race, had that event been possible this year, would probably have added further tints to the coat of many colors.

Next season there will be one set of racers for practically all the national tests, the characteristics of the machines being bore not exceeding 155 millimeters (6.1 inches) for four-cylinder engines, and a minimum weight of 1,100 kilos (2,425 pounds). Track races, hill-climbs and short-distance events will not be affected by the new rules. Thus an outlet will be provided for those objecting to being bound down by fixed rules.

Of the varied methods of classification adopted this year, limited cylinder area (bore and stroke) has united the largest number of competitors, being employed for the German Emperor's race, one of the Ardennes races, and for the coming Florio cup race in Italy. Yet it is the one which has been most severely criticised. Perhaps there is a little jealousy in their charges, but it is instructive to note the objections brought against a limited cylinder area by French leaders. Simplicity, ease of application and an increase of power are admitted to be in its favor. The charges against it are that it develops high-speed motors which suffer from abnormal wear and vibration, and that the increase in power is only obtained at the cost of excessive fuel consumption. The Fiat which won the German Emperor's race and the Fiat victorious in the French Grand Prix consumed prac-

tically the same amount of gasoline per 100 kilometers, yet the former had thirty horsepower less than the latter. The increased power obtained does not fascinate the French critic, one well-known writer declaring that a motor 152 by 110 bore and stroke and another 130 by 150 require as fuel 50 liters an hour for the former and 35 liters for the latter. The first develops 100 horsepower, the second 70. Supposing them of equal weight, for five hours' running without refilling the tank the weight per horsepower of the group motor and fuel tank is the same. The conclusion drawn, and which is generally acquiesced in, is that the regulation by cylinder area should be abandoned. Conditions considered the most advantageous are as long a stroke as possible with a moderate engine speed.

When the matter came before the conference opinion immediately rallied to a limitation of the bore only, leaving the determination of engine stroke to the fancy of constructors. France would have preferred a bore of 160 millimeters, which is only slightly below the average of Grand Prix racers, their object in maintaining this standard being to impress the public with the high rate of travel and to put tires to the most severe test, abolishing the use of dismountable rims to further this end. Germany did not defend her own bore and stroke limitation scheme, but asked for a bore limited to 135 millimeters, with the object of creating a *rapprochement* between the racer and the ordinary touring car. England acted as a mediator, and finally got the two extremists to unite on a bore of 155 millimeters and a minimum weight of 2,425 pounds. Next year's speed will probably be less than this year's record, though certain sanguinary individuals hope to maintain the standard despite the limitations. Mechanical conditions, however, are fairly satisfactory, the limitation of bore developing engines of long stroke and slow rotation, with a consequent diminution of friction. The chief objection brought against it is the difficulty of applying it to other than four-cylinder engines. Somebody has asked what bore would be allowed for a two-cycle four-cylinder engine, and the conference itself left to a special committee the task of determining conditions for six- and eight-cylinder engines.

French authorities had not the courage or the inclination to defend their own limited-fuel formula, under which they were beaten in the Grand Prix, but are not tired of sounding its praises in the technical press. It produced an excellent type of engine; without any increase in size of motor it gave a big advance in speed, and by showing the economy of the

automobile it touched a matter in which the public generally is interested. But it was too susceptible to atmospheric influences—French cars tuned up for bad weather were defeated on a fine day; it was delicate in its application, necessitating experienced organizers and close surveillance throughout—and it had to go.

There is an enormous economy in being able to build three machines only in place of three or four distinct types, and enter them in half a dozen important races. But there is a still further advantage, which will be appreciated more by foreign builders than by the leading French firms: Any constructor may begin work now and produce a set of machines for a series of races to commence next April. He has at least eight months in which to design, construct and try out his cars, compared with an interval of five or six months on previous occasions. A June race announced in January allowed such firms as Fiat, Renault and Mercedes to compete in a prepared condition, but it placed at a decided disadvantage firms who had less experience in racing or who were separated by an ocean from the scene of the contest. Walter Christie was not the only American engineer who studied the conditions of the Grand Prix. Other firms—they were several—examined the rules, considered the date and distance, and decided it would be money thrown away.

As half a dozen American firms do some business in Europe—principally in England—and many more are represented across the Atlantic by the increasing crowds of annual tourists, it is not unreasonable to suppose that there will next year be a more adequate representation of cars from this country in the great speed tests of the old world. To send a team of three cars, well tried out, to Europe for three months, where they could compete in at least three races, would certainly be more profitable than to ship over one or two hastily prepared Gordon Bennett racers, as has been done more than once in the past. Supposing Europe's rules are adopted for the 1908 Vanderbilt race, a larger foreign representation may be expected, as practically every firm of importance will have a machine or set of machines available for the contest.

### RACE METHODS TO CATCH SPEED VIOLATORS.

INDIANAPOLIS, IND., Aug. 12.—A crusade against alleged violators of the automobile speed law of the State has been started by the local police, and the method pursued is believed to be wholly original with the department. Chief Robert Metzger has instigated the method of running down fast drivers with the White steam touring car purchased by the department some time ago. As a result residents of the exclusive North Side districts are being treated to the most spectacular races at from twenty-five to forty miles an hour clip that the city has ever seen.

Naturally the system is a dangerous one, so dangerous that it has called down the condemnation of some of the best citizens of the city. The system is not employed in day time, as the police car is so well known. A speed indicator and three patrolmen in plain clothes, as well as one of the police chauffeurs, are employed in the work, and the testimony of the officer who watches the speed indicator, together with the record of the latter, is accepted as conclusive evidence in the local police court.

The automobile drivers are first timed, then commanded to stop. If they fail to do so, the driver of the police machine executes a series of maneuvers that forces the automobile of the victim against the curb and wedges him in, making escape impossible and a collision inevitable.

Various methods of catching speed violators have been tried by the police, none of which have given satisfaction until the one now in use. Chief Metzger insists that the law prohibiting a speed greater than fifteen miles an hour in residence districts will be strictly enforced. Violators of the law are fined \$1 and costs, amounting to \$11, and all except two have pleaded guilty.

### AUTOS PERMITTED IN NATIONAL PARKS.

WASHINGTON, D. C., Aug. 12.—Several weeks ago a number of automobilists of Seattle, Wash., requested permission to take their cars into the Mount Rainier National Park, but the Interior Department denied the request, as there was a strict rule prohibiting automobiles in the various national parks. The unjustness of this rule was pointed out to Secretary of the Interior Garfield during his recent visit to the Northwest, and immediately upon his return to this city he directed that a new regulation be issued permitting automobiles to be taken into the Mount Rainier National Park.

At the Interior Department it was stated that the new ruling is of general importance, as it makes a change in the management of the national parks, in which automobiles have not heretofore been permitted to operate, because of the dangerous character of some of the roads and the timidity of horses not accustomed to the machines.

It was further stated that the new rule is in the nature of an experiment and will be effective but one year. If the experiment is a success, however, it is considered probable that the innovation will soon extend to other parks and thus open up many fine runs that have heretofore been denied automobilists. The speed limit has been set at six miles an hour, except in long, open stretches, which are numerous.

### OILING ROAD AT \$100 PER MILE.

SEATTLE, WASH., Aug. 10.—Oil as an allayer of dust has been given its first, and very successful, trial in the State of Washington. One of the best stretches of road in the State is the macadamized section leading to the Meadows race track, where there is now a season of running races on. Many automobiles go out daily, not only privately owned cars, but such as are used for hire, and in fact the race meet is proving quite a mint to drivers of this class, as the street car service is wretched. Every machine would raise clouds of dust, and so County Engineer Valentine had the road sprinkled with common fuel oil, which contains about 40 per cent. of asphalt and makes an asphalt coating for the macadam. So successful has this proved that Mr. Valentine has decided to sprinkle the road twice a year, once late in the Fall, before the Winter rains begin, and early in the Spring, after they have ceased. He is of the opinion that this will suffice. This stretch of road also leads to Tacoma and is destined to become a part of the boulevard to skirt the shores of Puget Sound. Mr. Valentine is also planning to oil all macadam roads in King county. The expense is figured at \$100 a mile.

### DASTARDLY WORK OF AN AUTO WRECKER.

WINCHESTER, VA., Aug. 10.—Last Tuesday night some wretch attempted to wreck the automobile of "Jack" Hardesty on the Berryville-Winchester turnpike, about one mile west of Berryville, by placing a log across the road. The machine contained Miss Camilla Rutherford and Miss May Bushnell, Mr. Hardesty driving. When the auto struck the log the speed had been slackened down to about ten miles per hour, but the force of the impact was sufficient to throw Miss Bushnell from the machine. She died four hours later in the hospital of Dr. Tucker at Berryville, to which place she was rapidly taken in Mr. Hardesty's partially wrecked machine.

The matter has stirred up considerable excitement in this section and several arrests have been made. At a preliminary hearing a rural resident by the name of Simmonds, arrested upon circumstantial evidence, failed to prove an alibi and has been held without bail awaiting the action of the Grand Jury. No blame attaches to Mr. Hardesty, as he is a careful driver and well thought of generally. Prejudice against automobiles rather than personal grudge prompted the dastardly deed. Automobilists generally are greatly incensed over the happening and will exert every effort to have the guilty parties heavily punished.

ROBERTS IN THE HARRY HOUPPT THOMAS VANDERBILT CUP RACER THAT MADE THE FASTEST MILE AT ATLANTIC CITY MEET.

### CLOSING DAY AT ATLANTIC CITY MEET.

ATLANTIC CITY, N. J., Aug. 7.—The wind-up of the racing program of the Automobile Carnival came to-day with two outstanding features: in a race between two Stearns machines and an Oldsmobile the Stearns finished dead heat, and in running against time Montague Roberts made the mile in :39 1-5. Duncan Curry, of the *New York American*, was a conscientious referee.

Guy Vaughan and G. W. Hoffmann handled the two Stearns and Tom Berger took charge of the 30-horsepower Oldsmobile, each machine carrying four passengers. With a flying start, all kept together for three-quarters of a mile, when the two Stearns gradually pulled away from the Oldsmobile and rushed over the line neck and neck, the Olds being about fifteen yards in the rear.

Owing to an annoying delay in getting the various heats run off, there was a meager attendance when Roberts rushed away on his flight against time. Taking the extreme outside course, where the beach was hardest, the six-cylinder Thomas made the time of 39 1-5 seconds in handy fashion. The performance is only 3 4-5 seconds slower than Walter Christie's mark, made when the beach was in ideal condition. W. H. Wray made a time trial of 59 4-5 seconds on a Simplex motorcycle.

During the afternoon an automobile parade was held on Pacific avenue; the number of participants, the crowd of spectators and the favorable weather all contributed to make it a success.

### REPRESENTATIVE SHOWING ON THE PIER.

ATLANTIC CITY, N. J., Aug. 9.—Yesterday morning marked the opening of Atlantic City's first annual automobile show, and to-day, with more than 100 cars on view, most of them 1908 models not long from the factories, the show is in full blast, and a fitting feature of the week's carnival. The E. R. Thomas Motor Company's New York branch is one of the big exhibitors, though quite a number of the leading makes are well represented. For instance, the Stearns and the Oldsmobile are being shown by the Motor Shop of Philadelphia. The Acme is shown by its makers, the Acme Motor Car Company, Reading, Pa., while the Autocar Company, Ardmore, Pa., also exhibits its own product. West Stillman, of Philadelphia, is showing the Mercedes and the C. G. V. is also on view, while Gilbert S. Smith, of the Hamilton Auto Company, 206 North Broad street, Philadelphia, is really the cock of the walk, as he claims to be the only man here with a full line of 1908 models, which arrived here by express only yesterday. Another well-known Philadelphia house with a prominent exhibit is the Titman-Leeds Company, in charge of E. C. Leeds, who is showing the Studebaker, Pope-Hartford and Matheson. The Keystone Motor Car Company, of Philadelphia, shows the Packard and Buick, the exhibit being in charge of E. C. Johnson. Armand T. Nichols, whose car won several prizes in the parade for decorations, has it on exhibition.

INTERIOR OF YOUNG'S MILLION DOLLAR PIER AT ATLANTIC CITY, WHERE THE AUTOMOBILE SHOW WAS HELD.

## LATE SUMMER HAPPENINGS IN CLUB LAND

### MINNESOTA ASSOCIATION PLANS A BIG RUN.

ST. PAUL, MINN., Aug. 13.—The Minnesota State Automobile Association is to open the new tri-city road with what will be a small-sized A. A. A. tour, the latter part of August or early in September. Fifty cars are expected to participate and the run, which will be to Duluth, will be held under the same conditions as the national event. The tri-city road is the outcome of a plan of local autoists to connect Duluth with the Twin Cities that has been much talked of but only assumed definite shape this Summer. The autoists of Duluth raised a fund of \$3,000, which has been spent on the roads leading out of the Zenith City, while the commissioners of several other counties have co-operated with the State Association in repairing the roads. The latter are all to be posted and a Twin City dealer has offered the association 5,000 complete sign posts provided the association will place them. It is expected that a number of Duluth autoists will come here in order to participate in the run.

The St. Paul Automobile Club also has an event of its own on its hands—it is planning to hold a hill climb within the next few weeks. Rufus Edwards is chairman of the committee in charge and active preparations are under way. A number of successful hill climbs have been held across the river and local autoists are anxious to show what they can do in this line. It is probable that Ramsey Hill will be selected as the site of the climb, as it is the most desirable hill in the city, though at present it is badly encumbered with loose rock, which will have to be removed before it can be used, and the club is investigating the matter to see if this can be done properly in time for the climb.

### ROCHESTER'S BELATED ORPHANS' DAY.

ROCHESTER, N. Y., Aug. 13.—Although it is somewhat later in the season as compared with other celebrations, Rochester's treat to the orphans lost none of its importance on that account. The members of the Rochester Automobile Club bent every effort on the successful outcome of their Orphans' Day celebration, and there was no doubt that they did succeed in the treat given 422 waifs from the local Industrial Home. Headed by a band, the parade got under way at 1:30 with no less than 140 cars in line, and more at the disposal of the club committee had the latter called for them—certainly an unusual situation where similar events are concerned, as there is usually a dearth of vehicles to transport the prospective passengers, despite the number that can be crowded into a car. The children were taken to Ontario Beach Park and treated to its numerous attractions, with plenty of pink lemonade on the side to make things run smoothly. The return trip was undertaken at 5:30 P.M., after a most enjoyable afternoon. The club was aided in its entertaining by Larry Saxton, the popcorn specialist, who donated all of his product the youngsters could consume, while an equally liberal supply of cake was contributed by J. A. Seel. J. Hungerford Smith was responsible for the pink lemonade, and the Rochester Candy Company gave each orphan a two-pound box of sweets.

### AURORA CLUB FOR LAW ENFORCEMENT.

AURORA, ILL., Aug. 13.—In order to further the work of bringing offenders to bar, the Aurora Automobile Club has communicated with State's Attorney Reid and will render all possible assistance in bringing about a strict compliance with the new statute now in force in Illinois. Many of the members of the club have not gone to the trouble of taking out licenses under the new law and the secretary has offered to supply a list of the delinquents to the State, so that both in checking the reckless speeding evil and in bringing other offenders to bar the State's Attorney will have inside information.

### SCHENECTADY CLUB BEGINS ACTIVE WORK.

SCHENECTADY, N. Y., Aug. 13.—The newly organized Automobile Club of Schenectady is already beginning to justify its existence by taking up the good roads cause in this part of the State. At a recent meeting held at the Mohawk Club it was voted to purchase 100 signs, half of which will be painted to show the distance to Schenectady from outlying districts, while the remainder will be used for general marking in the surrounding country. It was also voted to purchase twenty-five danger signs, which will be placed at a number of bad places along the roads in the vicinity, including spots on the Troy road and in the neighborhood of the Boston and Maine Railroad bridges, which are particularly nasty places for one not familiar with them.

The touring committee is considering plans and later in the Fall will arrange an automobile day for the inmates of both the Children's Home and the Day Nursery.

The Board of Governors of the club is as follows: C. H. Benedict, Gerardus Smith, J. W. Yelverton, A. F. Knight, George H. Hill, H. S. DeForest, W. Dewey Loucks, H. G. Chatain and N. I. Schermerhorn. Following are the committees: Membership, George H. Hill, Dr. H. A. Staley, Charles Blittersdorf, T. H. Soren, Edwin Clute; exhibition tours and contests, H. G. Chatain, J. W. Yelverton, Dr. W. P. Faust, B. A. Burtiss, J. W. Clute; laws and ordinances, W. Dewey Loucks, E. C. Angle, A. G. Davis, Hinsdill Parsons, W. W. Wemple; good roads, H. S. DeForest, Earl Furman, E. F. Peck, F. R. Champion, George Close; grievances, N. I. Schermerhorn, Frank McClelland, Gerardus Smith, August Kruesi, H. Scudder.

### PRESIDENT DUTTENHOFFER GIVES ADVICE.

CINCINNATI, O., Aug. 13.—Just back from a five weeks' trip with his family, the entire course of which was not marked by a mishap, not even so much as a puncture, President Val Duttenhoffer, of the Cincinnati Automobile Club, states that it is his intention to recommend at the next meeting of the Board of Governors of the club that the new speed ordinance which it has recently had prepared for introduction before the council be dropped.

"Let the present ordinance stand," says Mr. Duttenhoffer, as the result of his observations in New England. "It will do as well as any, and there is no use of drawing any more stringent lines around ourselves than the present ordinance provides. Autoists are far more liberally treated in the East than they are here, as everywhere in New England we found a straight twenty-mile-an-hour limit. At points where there were special rates of speed, signs were posted telling how fast autos could proceed. That's the way it should be here in the West, but the West doesn't seem to be willing to pursue so liberal and advanced a policy."

### PROSPERITY OF LARGEST CLUB IN COUNTRY.

NEW YORK, Aug. 12.—An official announcement from the Automobile Club of America tells a story of promising prosperity, coupled with large gains in membership that are equaled by few similar organizations anywhere. The following comes from the club's publicity department:

The Automobile Club of America took possession of its new clubhouse and garage on West Fifty-fourth street, April 18 last. On the first day of August, three months after its occupancy, \$20,000 of the second mortgage bonds were redeemed and cancelled.

Much satisfaction is expressed among the members at this evidence of the club's stability and progressiveness, and the governors are now planning to have at an early date in the Fall a meeting of the club members for the purpose of burning the cancelled bonds. Further blocks of the bonds will be redeemed at short intervals.

The membership of the club is increasing very rapidly, and before the close of the year promises to reach the 2,000 mark.

PETERSON, THE PERSISTENT, AND HIS METEOR.

**A PERSISTENT A. A. A. TOURIST.**

As a try-out of a new car the 1,500 miles pounding of the A. A. A. tour was sufficient to satisfy the strenuous nature of most men and machines. A. L. Petersen, of the Cleveland Automobile Club, undertook this kind of trial trip for his Meteor machine, and although failing to finish among the perfect scorers, owing to a series of unfortunate road accidents, gave a display of skill and dogged perseverance of more than ordinary interest.

On the second day's run from Toledo to South Bend, over roads of such a difficult nature that fourteen cars incurred penalization, a broken bolt on the steering gear caused a delay which, on such muddy roads, it was impossible to regain later. Trouble followed on the following day, when, in order to clear a buggy obstructing the road, Petersen shot his car over a six-foot ditch and cleared a barbed wire fence. No serious injury was done either to car or men, but it was fully two hours before the Meteor could be got back to the greasy highway. Three uneventful days followed, with control reached on time, notwithstanding a leaky radiator as the result of the previous leap. Finally, on a quiet corner of the road in Ohio, with a supply of water handy and a cottage fifty yards away up the hill, it was decided to take down the radiator and make a thorough repair. It was not the easiest of tasks to solder a radiator on the road with the fire for heating the iron fifty yards away. When the job was finished it was found that the cranking handle, which had been bent through the fall of the car, broke open the radiator tubes whenever the motor was cranked.

At Pittsburg the cranking handle was dismantled, the radiator soldered, and the engine started by pushing the car. This seemed satisfactory and a clean run was hoped for. Coming out of town a trolley car driver stopped his vehicle and signalled the automobile to pass ahead. When they were opposite, the town vehicle driver turned on current, the result being a bent front axle and a delay of several hours. With no thought of abandoning, Petersen commenced repairs, and when the main body got up at Baltimore next morning he was there to greet them, and there was no further delay in the run to New York City.

A few days later, while Petersen was driving his car homeward and westward, passing through Schenectady, N. Y., it skidded on striking the sprinkled asphalt pavement, turned completely round and hit a trolley pole, smashing the rear axle and the rear wheel. Forty trolley cars were held up while the disabled Meteor was being removed. But Petersen made repairs and will persist again.

Among several storage battery patents recently granted to an American inventor, one is for a new method of preventing the negative plates from losing their capacity. The active spongy lead is impregnated with an inert material like carbon, and in this way the passageway for the diffusion of the electrolyte into the pores of the plate are maintained intact.

**AUTO EXPORTS CONSTANTLY ADVANCING**

At the present rate of increase it is a matter of but a comparatively short time before the value of the automobile parts being sent out of this country will exceed \$1,000,000 monthly. For an industry that has hardly been in a position to export its product for half a decade, this seems almost incredible, but a glance at the figures compiled by the Department of Commerce and Labor tell the story of the constant growth of the foreign trade in American automobiles better than any dissertation on the subject possibly could.

The fiscal year ends with June and the Government report just to hand shows that during the month of June, 1906, automobiles and parts to the value of \$539,268 were sent out of this country, as compared with \$732,054 for June, 1907, while the years ending with those months showed totals of \$3,497,016 and \$5,502,241 respectively. For the year ending June, 1905, the total was but \$2,481,243, from which it will be evident that the foreign trade has considerably more than doubled in the short space of two years. Doubtless the most significant fact to be gleaned from a review of these monthly reports is to be found in the item representing the takings of automobile-producing countries.

In short, it will be readily seen that the bulk of the foreign trade in American automobiles is to Great Britain and the Continent, the amounts shipped to the remainder of the globe being comparatively insignificant, with such exceptions as Canada and Mexico. June, 1907, marked the end of the first year in which detailed figures separating the value of complete cars and parts have been kept, with the result that it is seen that no less than 2,862 cars were sent abroad in the last twelvemonth.

The report in detail is as follows:

	JUNE		TWELVE MONTHS ENDING JUNE

ALFRED REEVES, GENERAL MANAGER A. M. C. M. A. Mr. Reeves is a great believer in the health-giving value of automobiles, and daily he is to be seen with his family in the vicinity of his new home at N. Y. Master Robert Reeves, the younger son, has a strong desire to his father at the wheel of the Maxwell.

**Aluminum as a Material for Automobile Construction.** To the designer of earlier days, who was confronted with the problem of carrying a cumbersome, low-powered motor and an equally heavy chassis, on pneumatic tires, aluminum came as a revelation. It meant the saving of many valuable pounds in both weight and transmission, and was universally availed of for this purpose, even though its employment did not always bring that satisfaction in service that was to be desired, as cast aluminum—iron in which it was most generally used—has the grave defect of weakness.

It is this characteristic, as well as the desirability of its use as a material for automobile construction at all, that is now the subject of a bone of contention. There are too many sides to the question to permit of their discussion at length here, and the sole purpose of this article is to throw a little light on a state of affairs that may seem inexplicable to the layman. When an engineer states that he has analyzed certain specimens of a material, such as aluminum, and has also subjected proofs to the usual tests with stated results, that do not throw any credit on the material in question, it is hardly logical to immediately jump to the conclusion that all material which passes under the same generic name is, to put it in the vernacular, rotten. Nor does it follow when a reputed authority takes up the cudgels in defense of aluminum and his opponent hood and says, "Here is a sample of what can be done and what is being done," that the first engineer was away off or all wrong. Doubtless the test pieces he examined were rotten, and the probability there are a great many crankcases and gear-

boxes to-day that are equally bad; but the mere fact of their existence is not conclusive evidence that all are bad, nor does the statement of an authority to the effect that cast aluminum can be made strong enough for the purpose make them good. It simply shows that there are a great many poor specimens extant, and probably many more are being turned out; in short, that there is a vast deal of room for improvement, and that some engineers should seek this in the employment of other materials offering equal advantages, is not in itself particularly strange.

**Importance of Steering Gear Construction.**

If daily newspaper reports correctly reflect the situation, defective steering gears must be held responsible for an appalling list of fatalities. One day's gleanings brings to light no less than four accidents in widely separated parts of the country. All four appeared in the same issue of a New York daily, and every one of them was attributed to a faulty steering gear—three directly and the fourth by inference. Two of the accidents were attended by fatalities and the others by severe injuries, and doubtless the average man can recall scores of similar reports during the past few years in which the accidents have, almost without exception, had gruesome terminations.

Before accepting such reports at their face value it must be remembered that the average daily newspaper reporter's first duty is to make a story, and that his narrative may be built upon an extremely meagre foundation of fact does not cause him any twinges of conscience. Ever since electric lighting has become general it has been a common practise to report mysterious fires as being due to defective insulation, frequently where there was no wiring at all in the place. In the same way, many an automobile accident is attributed to a faulty steering gear, and though a large proportion of such reports may be unwarranted, there is every reason to believe that the majority of them are founded on fact. The showing is one that should rouse both the manufacturer and the autoist to a keener sense of the responsibility placed upon this essential. The former to spare no expense or pains to see that it is made as nearly infallible as any device of human creation well can be, and the latter to see that care on his part contributes as much as possible to keeping it in that condition of continued efficiency that is vital to safety.

**Society of Automobile Engineers Answers the Need.**

If there were ever an instance in which that saying of the press agent about filling a long-felt want was justified, it is to be found in its application to the gap in the engineering side of the automobile industry that has been so well occupied by the organization of the Society of Automobile Engineers. Early in its history every industry feels the need of organization and co-operative effort, particularly as applied to the technical development of its product, and in no other has this been such an imperative need as in the making of automobiles, for very obvious reasons. It was recognized by the engineers themselves from the very beginning, but it was some time before any attempt at a remedy was made, and then it merely resulted in benefiting those connected with a part of the industry.

What has been needed all along was an organization open to the automobile engineer regardless of industrial affiliations, and this need has been well supplied by the organization of the Society of Automobile Engineers. The latter has been successful since its very inception and, though but in its second year at the present writing, is in an unusually flourishing condition. The fact that its membership is composed of engineers from every branch of the industry, and includes many of the most prominent from the different divisions into which the American industry is separated, speaks for itself. Despite its youthfulness, it has already done good work and merits the hearty support of the industry as a whole, for its possibilities of development are unbounded.

## THAT NEW YORK CITY ORDINANCE.

In New York City, hereafter, it seems the maximum penalty incurred by a violation of the automobile speed laws cannot exceed a fine of \$10. The State law makes such a violation a misdemeanor, but it also grants a general power to the municipality of New York to pass its own ordinances on the subject, and this the Board of Aldermen has done, reducing the penalty from an allowable maximum of a \$250 fine, with imprisonment for repeated offenses, to \$10.

William Heiner was arrested on June 1 last for speeding and held for the Court of Special Sessions for trial under the provisions of the State law, known as the Motor Vehicle law. His attorneys, Flammer & Flammer, sued out a writ of habeas corpus, contending that the passage of the ordinance by the Board of Aldermen precluded the holding of a violator for trial at Special Sessions on the charge of having committed a misdemeanor, and this contention was upheld last week by Justice Truax of the Supreme Court. This means that the only punishment which can be inflicted is that provided by the city ordinance, which supersedes the State law in accordance with the provisions of the latter to that effect. Consequently Heiner could not be subjected to a fine of more than from \$1 to \$10.

Assistant District Attorney Taylor, for the prosecution, contended that the law of the State was paramount to any ordinance that could be enacted by the Board of Aldermen, and that that body could not pass an ordinance which would render nugatory the provisions of the general law. But in his opinion Justice Truax states that the defendant cannot be held for a misdemeanor under the State law or under the Penal Code, and is only liable to the infliction of the penalty prescribed by the city ordinance in question, as the latter was passed in conformity with power granted by the Legislature and contained in the State law.

### Opinion of Counsel Niles of the A. C. A.

W. W. Niles, counsel to the Automobile Club of America, is quoted as follows in the *Herald*:

"I am inclined to think that this decision will be upheld if the case is taken to the Appellate Branch. The city ordinance was passed last November and covers all kinds of vehicles, thereby bringing it under the special provision in the State law that renders it valid.

"While there may be some differences of opinion among members of the Automobile Club, and while I do not wish to seem to express the opinion of men with whom I have not discussed the matter, it is my personal opinion that this decision is unfortunate. It leaves the maximum penalty a \$10 fine, and I seriously question whether this will be sufficient to deter reckless drivers, and especially hired chauffeurs. If my fears prove well grounded the result will be more reckless driving, deeper enmity on the part of non-users toward motorists as a class, and the enactment of such drastic laws at Albany that serious hardships will be imposed on all that use automobiles. I hope my fears may prove groundless.

"At each legislative session we have difficulty in preventing unfair legislation as it is, and if the resentment of the non-using class grows we probably shall be unable to keep unfair laws off the books.

"On the other hand, the new order will be a great advantage to well meaning automobilists, who have been imposed on by unfair arrests. The Automobile Club stands for a pretty stiff law. It has complained, not about the severity of the State law, but of the unfair and often unintelligent manner in which it sometimes has been administered."

### Judge of General Sessions Court on Ordinance.

Judge Charles S. Whitman, of the General Sessions Court, said:

"I am afraid that Judge Truax's decision is sound law. I say 'afraid' because it will cause a condition which will be bad for the public that does not ride in motor cars and which at the same

time will react on the conservative and law-abiding motorists. A \$10 fine, the greatest penalty now imposable, is a joke to the man wealthy enough to own an automobile. If reckless and inconsiderate driving results, it will mean a change in the State law and the imposition of penalties heavier than were ever in force here. It must be remembered that the legislators from the country districts are not over fond of the automobilist, anyway.

"If there is any marked increase in reckless driving it will be found among the paid chauffeurs. In my four years' experience on a magistrate's bench I observed that in a majority of cases violations were committed when the owner was not in the car."

### Comment of Chairman Terry, A. A. A. Legislative Board.

Chairman Charles Thaddeus Terry, chairman of the A. A. A. Legislative Board, comments as follows upon the matter:

"The decision of Justice Truax would not, under any circumstance, indicate any necessity for a more drastic state law. The fault, if fault there was, lies with the ordinance adopted by the Board of Aldermen and not with the State law. Under the State law, section 6, subdivision 1, the Board of Aldermen could have provided in its ordinance that the same penalties provided in the State law could be inflicted for a violation of the ordinance; and if the Board of Aldermen in enacting its ordinance had said nothing about penalties, then, under this section 6, subdivision 1, chapter 538, of the laws of 1904, the penalties provided by the State law would have applied automatically as provided in that section.

"Everyone, so far as we know, who has given any study to the question considers the present State Motor Vehicle law not only sufficiently drastic, but in many respects unreasonable and unnecessarily harsh. The fact that the Board of Aldermen, instead of re-enacting the penalties provided by the State Motor Vehicle law in its ordinance, cuts down those penalties from \$250 to \$10 and omitted entirely any provision of imprisonment, would reasonably indicate that the Board of Aldermen consider the penalties provided in the present State automobile law as altogether too harsh and severe; otherwise there would have been no reason why the Board of Aldermen should not, in the ordinance enacted by it, have provided for the penalties as they stand present in the State law, because under that State law the Board of Aldermen have sole power to re-enact those penalties."

Despite the decision of Judge Truax, Special Sessions Judge Flammer, in Brooklyn, Monday imposed fines from \$20 up to \$100 on speed violators. Judge Flammer announced that, unless the Appellate Division overrules him, he sees no reason why he should not continue imposing heavy fines. He points out in his decision that the laws of 1904, while taking away from cities the right to pass ordinances fixing the speed limit, say nothing about prosecutions for violating the State speed law. The statutes do not take away from the city the right to fix the amount of fines, nor do they divest the State of that right; so that, as it stands, there is nothing to hinder prosecutions both by the State and the city. Cooley's Constitutional Law is quoted to show that there is no sacrifice of constitutional right if both a municipality and State punish an offender for the same crime.

### AUTO INSURANCE LIMITED TO CASUALTY CO'S

ALBANY, N. Y., August 12.—Under an amendment to the insurance law made this year, the Insurance Department has questioned the right of marine insurance companies to write automobile collision risks, and at the request of the companies affected the question was recently referred to Attorney-General Jackson for settlement, who has just decided in the negative. The latter's ruling, which was made public by Superintendent of Insurance Kelsey last week, is as follows:

My interpretation of the amendatory provisions of Chapter 2 of the laws of 1907, is not in accord with the contention of the counsel of the companies interested, and I quite agree with the position taken by your department, that it was not the intention of the Legislature to confer authority to issue policies against collision hazards in the use of automobiles, upon corporations authorized to transact business under the provisions of Articles III and IV of the insurance law.

**KENTUCKY TO HAVE A. A. A. STATE BODY.**

LEXINGTON, KY., Aug. 12.—The formation of the Blue Grass Motor Club, with a membership of fifty and indications of twice that number inside of thirty days, will now make it possible for Kentucky automobilists to perfect a State organization of the A. A. A. The Louisville Automobile Club became a member of the A. A. A. some time ago, and the Paducah Automobile Club is ready to join with the Louisville Club and the newly organized Blue Grass Club in the completion of the Kentucky State Automobile Association.

The Blue Grass Club contains members not only in Lexington, but in neighboring places, and besides electing F. R. Toewater as president, vice-presidents were designated as follows: G. A. Roy, Nicholasville; W. H. Walcott, Winchester; Hunter Brothers, Versailles; Dr. F. F. Bryan, Georgetown; Charles Cecil, Danville; John W. Williams, Mt. Sterling; George Clay, Paris, and W. E. Sims, Midway. Dr. George D. Kelly, of Lexington, was elected treasurer, and E. H. Alexander secretary. The first work to be undertaken by the club will be that of posting danger signals in the vicinity. The executive committee of the club consists of Dr. Julian McClymonds, Dr. H. H. Roberts, and J. W. McCormick. S. J. Roberts, editor of the *Lexington Leader*, and Desha Breckinridge, editor of the *Lexington Herald*, were elected honorary members, and it is expected the same course will be pursued with regard to the editors of other papers in Central Kentucky. The club will hold a smoker August 21.

**GALVESTON'S SEAWALL NOW A SPEEDWAY.**

GALVESTON, TEX., Aug. 10.—Under the Texas automobile law the various municipalities are empowered to make their own restrictions on automobile speeding, and Galveston has just taken advantage of this privilege. "We have succeeded in securing very satisfactory legislation from the city," says Moritz O. Kopperl, president of the Galveston Automobile Club. "The State law permits a uniform speed of eighteen miles, while the city ordinance has defined a certain territory in the business section wherein the speed is restricted to ten miles an hour. On the other hand, the city has exempted from all speed limits, as allowed under the State law for speedways, the boulevard on top of the seawall as far as laid, with the exception of about three blocks in front of the baths and Electric Park, which portion is usually very crowded, both with vehicles and foot traffic. The beach being a speedway, is also exempted under both the State and city laws. In the suburban districts of the city a speed of fifteen miles an hour is allowed." Galveston is the first city in the country to give the autoist any such leeway as this and the outcome of the experiment will be watched with interest by autoists, as it is feared advantage will be taken of the privilege.

**WORCESTER DOESN'T LIKE RE-REGISTRATION.**

WORCESTER, MASS., Aug. 12.—Secretary James Fortescue, of the Massachusetts Automobile Association, has notified the Worcester Automobile Club that it would be inconsistent with the position taken by the State Association before the Legislative Committee on Taxation for the association to attempt to test the constitutionality of the new State re-registration law. At a meeting of the Worcester club held last month it was voted to request the State Association to have the constitutionality of the law tested, and despite Secretary Fortescue's letter the club secretary has been directed to collect data covering the matter at issue, so as to be in a position to decide what to do in the future. Most of the members of the club have paid their re-registration fees under protest.

At the recent meeting of the club the by-laws were amended, doing away with the regular monthly meetings. The annual meeting in May is retained, and during the rest of the year the Board of Governors will handle the club business, except at special meetings called on occasions out of the ordinary routine.

**FIFTY-THREE STARTERS FOR BRESCIA RACES.**

MILAN, August 2.—Italy's last racing event of the season, to be contested on the Brescia circuit, September 1 and 2, has united a total of 53 entries. Thirty-nine of these are in the race to be run under German Emperor rules for the Florio Cup and 14 will compete in the speed test under the Grand Prix formula. Entrants are, for the Florio Cup, 3 Spa, 3 Itala, 3 Isotta-Fraschini, 3 Bianchi, 3 De Luca Daimler (Italian Daimler), 3 Rapid, 3 Benz, 3 Brixia Züst, 3 Sudddeutsche Fabrik, 3 Wolsit (Italian Wolseley), 2 Rochet Schneider, 3 Junior, 1 Eisenbach, 1 Aries, 2 Darracq. For the race under French rules the starters are 3 Bayard-Clement, 1 Diatto-Clement (Italian Bayard-Clement), 1 Darracq, 3 S. P. A., 3 Itala, 3 Dietrich. Fiat, winner of the two previous races under these rules, has decided not to compete on the Brescia circuit. Renault, who came second in the Grand Prix, will not start, neither will the Brasier team. It will be noticed that Italy has a preponderance of entrants.

The technical committee of the Automobile Club of France has offered a gold medal, to become the property of the constructor whose car, traveling at not less than sixty-two miles an hour, shall have the lowest fuel consumption in the Brescia race.

**DE DION STILL ASKING FOR AUTODROME.**

Marquis De Dion, vice-president of the Automobile Club of France, head of the De Dion-Bouton factory, near Paris, though still professedly in arms against automobile racing, appears to have taken the sting out of his blows. Speaking to a *Herald* representative, he declared that next year he hopes to organize another race for touring machines with a limited gasoline supply on the Lisieux circuit, cutting out the eliminating touring event on unprotected roads, on account of the unreasonableness of many drivers.

According to the Marquis, the autodrome is bound to come. By autodrome he does not mean tracks such as are found in America or at Brooklands, in England; but a course fifty kilometers in circumference, over the hills and valleys of Auvergne, where, on perfect road surfaces, the automobilist will find every class of country likely to be encountered by the average tourist in a run through Europe.

**AUTOS SIXTH IN FRENCH NATIONAL EXPORTS.**

PARIS, August 5.—Less than seven years ago the automobile industry of France occupied forty-fourth position in the list of exports. This year, according to official returns, it figures sixth on the list, with \$16,800,000 exports for automobiles and cycles during the first half of 1907, and \$2,600,000 for tires during the same period. French exports surpassing the automobile in importance are:

Silk tissues .....	\$36,600,000
Wool .....	32,800,000
Cotton tissues .....	30,800,000
Woolen tissues .....	23,800,000
Wines .....	21,400,000
Automobiles and tires .....	19,400,000

**RENAULT TO TRY CHICAGO NEW YORK RECORD.**

An attempt on the Chicago-New York automobile record is in contemplation by Paul Lacroix, selling agent of Renault Freres. With a 35-45-horsepower 1907 model Renault run-about, it is intended to leave Chicago some time next week and endeavor to clip a few hours off the existing record for runs between the two cities. Additional interest attaches to the event from the fact that this is the first occasion on which a French car has attempted a record over this route. This week Paul Lacroix covered the distance from Chicago to New York to familiarize himself with the roads and make arrangements. The trip was done on a 1905 car and, though there are many places where road conditions made speeding impossible, Mr. Lacroix is confident that he can do things to the record.

**RICHMOND ENTHUSES OVER AUTO RACING.**

RICHMOND, VA., August 12.—For the first time in its history this city has been treated to an automobile race meet, and to say that it took things by storm is to put it mildly. The meet was held under the auspices of the Richmond Automobile Club, and met with such success that it has been decided to hold another in September.

The only incident to mar the day's sport occurred in the free-for-all, when Howard E. Van Lear, driving a Ford, skidded on the back turn and went through the fence, receiving sundry bruises and cuts, but no serious injuries. Of the 1,600 or more spectators at the track, it was figured that two out of every three were physicians, so there was no lack of medical attendance. Van Lear was simply surrounded by a flock of doctors, but one wit observed that two of the M.D.'s made no attempt "to get in the game" and asked why. "Well," said one of them, "you see, the machine turned over twice and did not kill Van Lear, so we think it but fair to give him a chance."

The first event was a five-mile race for stripped runabouts; and was taken handily by Ford No. 1 in 6:48, with Ford No. 7 second in 6:55. A Buick, Maxwell and Cadillac were the other entrants, and the first named, with Coddington up, was a good third.

This was followed by another five-mile event, in which there were only two entrants—a 30-horsepower Autocar, driven by L. H. Foster, and a White steamer. According to the scribe of one of the dailies here Foster had bad luck. "On account of the gasoline in the car being 86 test," said the reporter, "the machine got hot and the plug burned out on two occasions, making it impossible for the big red car to win." The White steamer completed the distance in 8 minutes.

There were only two entries in the third race also, cars listed at \$2,000 and under. A 12-horsepower Franklin and a 22-horsepower Buick faced the starter, and the former won in the second best time of the day, making the five miles in 8:01.

Following this came a doctor's race at two miles, which was taken by Dr. Stuart MacLean in his 12-horsepower Franklin, in the good time of 3:40, Dr. Moses Hoge being second in a 20-horsepower Maxwell, 12 seconds later.

The most exciting event of the day was the free-for-all, in which C. C. Coddington, driving a 22-horsepower Buick, walked away from his field, making the five miles in 7:12.

**THE RETIREMENT(?) OF BARNEY OLDFIELD.**

MINNEAPOLIS, MINN., Aug. 12.—Barney Oldfield, dare devil, etc., in an interview says that he is going to retire from racing and follow the more quiet pursuit of selling cars. "I'm going to quit," he said. "It's on the square with me, and I ain't making farewell towers either. Now, I'm a professional," confessed Oldfield, "and I'm out for coin. Maybe I shock some of these people who think that automobile racing ought to be just a gentleman's game when I get right down to hardpan as to money matters. I've seen the auto racing game from start to finish. I was first in this country and now I'm last. The game is dying out here. It costs the manufacturers too much to build expensive racing cars and to keep them on the road. The game is better than ever in Europe now, but I won't go over there. I'm getting pretty old and this season will be my last."

**ANOTHER MEMBER FOR THE A. M. C. M. A.**

At the last meeting of the American Motor Car Manufacturers' Association, the Dayton Motor Car Company, Dayton, O., makers of the Stoddard-Dayton cars, were elected to membership, and will exhibit at the association's show in the Grand Central Palace, beginning on October 24.

**LOVING CUP PRESENTED TO M. J. BUDLONG**

HARTFORD, CONN., Aug. 12.—On his retirement from the presidency of the Electric Vehicle Company—an office which he held for the past four years—M. J. Budlong was presented with a token of the esteem in which his associates in the big Columbia plant held him. This took the shape of a silver loving cup appropriately engraved, and toward the purchase of which practically every man in the shop contributed. The whole affair gathered in the electric assembly department on the occasion of the presentation, at which Mr. Budlong very feelingly thanked the donors, both for the cup and the appended list of subscribers, which he said he would treasure equally as most tangible evidence of friendships during his service with the Electric Vehicle Company. His remarks were greeted with hearty applause, and as each man passed out he received a personal farewell in the shape of a hearty hand-grip from the man who had guided his destinies for the past four years. Because of his frank, open manner, his willingness to help another up the ladder and his generally manly qualities, Mr. Budlong was much admired and respected by every one in the works, who felt he had lost a personal friend.

**"DIXIE" TO BE FEATURE AT JAMESTOWN RACE**

Fresh from her victory in the International British motor race, Commodore Edward J. Schroeder's fast motor boat *Dixie* will be transferred from the steamer *Minnetonka*, arriving in New York, and sent to the Jamestown Exhibition to compete in the races held during the week of September 4. The programme of the Jamestown races is as follows: Sept. 4, reliability trials of six hours' duration; Sept. 5, long-distance races for boats of all classes; Sept. 6, mile and kilometer speed trials for boats of all classes; Sept. 9 and 10, series races, with time allowance as per rating for cabin cruising boats and open high-speed boats. On the closing night there will be an illuminated naval pageant. The cruises of the Motor Boat Club of America, leaving New York on August 20, and the American Power Boat Association, leaving on August 22, both having Jamestown as their objective point, are expected to unite fifty boats.

**FIRE DESTROYS LARGE NUMBER OF CARS.**

Twenty-five cars, including one owned by New York's controller, Herman A. Metz, and said to be valued, in the aggregate, at from \$75,000 to \$100,000, went up in flames with the destruction of the factory and repair shop of Mack Brothers, Atlantic avenue, near Third, Brooklyn, one night last week. The fire started in a storage shed in the rear of the factory; a failure to send in an alarm promptly permitted it to gain considerable headway before the firemen arrived. Attempts were made to save the cars, but only two were gotten out. August Mack, a member of the firm, expressed it as his opinion that the fire was of incendiary origin, as threats had been made to burn the place owing to the noise at night, the factory having worked night and day for the past two months.

**IMPORT FIGURES SHOW SUBSTANTIAL GAIN**

Custom house returns for the month of July past show a considerable gain in the number and value of foreign cars brought into the country as compared with the same month in 1906. July, 1907, 115 cars or chassis of an aggregate value of \$423,339.88 were imported, as compared with 106 cars of a total appraised value of \$379,881.25 in the same month a year ago. For the period of six months between January and July, 1907, the figures show a falling off as compared with same months in 1906, the figures being 705 cars, valued at \$2,401,310.76, as against 822 cars, valued at \$2,742,536.37 respectively. For 1905 the figures were 543 cars, valued at \$1,992,843.79.

WORK AND MAXON'S OLDSMOBILE IN A DITCH.

### ON THE OLDS TRIP TO THE PACIFIC COAST.

Two hundred miles with but three cylinders working formed the chief part of the chapter preliminary to the entrance of Fred V. Work and C. J. Maxon into Denver. They are en route to the Coast, and found the going pretty hard in Nebraska and Eastern Colorado, where the accompanying photo was taken. One of the units of the coil broke down, and, not having another to replace it, they were compelled to limp over miles and miles of low ground, crossing many fords, and in some instances having to get over irrigating ditches in which the water was three feet deep. Worse even than the water were the stretches of sand, which were so soft in places as to be hub deep. They spent a week in Denver before continuing.

### ANOTHER LIFE-GIVING SOLUTION FOR TIRES.

GRAND RAPIDS, MICH., Aug. 5.—During the course of the history of the bicycle, and since the latter, of the automobile, there have been an endless number of compounds discovered for prolonging the life of the pneumatic tire and rendering it puncture-proof, some of them being in successful use to-day. But all of these mixtures have been intended for internal application. Now Norman Fellow, of the Michigan Lithograph Company, of Grand Rapids, has been granted patents and trademarks on a substance he terms "Rubberlife." It is said to have been given a two years' test on the rubber sheet used in lithographing, the treated sheets lasting twice as long. The compound is composed of several ingredients and is about the consistency of thick milk. Its application to the outside of a tire is said to fill the pores of the rubber, making it hard though resilient and serving to prevent the entrance of sand and water.

THOMAS FORTY IN FULL CRY ON GUADALAJARA CIRCUIT.

Interest in automobiling grows apace in Mexico and the success of the first road race held in the Spanish-speaking republic was such that others will be arranged for before long. The Thomas made a record-breaking lap, but met with an accident and was disabled.

### WINTON 1908 ANNOUNCEMENT SOON DUE.

CLEVELAND, O., Aug. 12.—"In about two weeks," says Chas. B. Shanks, general sales manager of the Winton Company, "we shall announce our line for 1908, and our story will be well worth reading. Mr. Winton has been at work for nearly four years on a single model intended to establish a new standard for motor car design and construction, and it is due to the fact that he has been thus concentrating his thought and effort that the Winton Company has kept out of races and contests requiring specially constructed cars.

"A few automobilists of wide reputation have seen and tried out this newest Winton creation and, if we may judge from their decision, our 1908 car is destined to be the 'exclusively best' of the year."

### TESTING ENGINES ON A LARGE SCALE.

When a plant has a capacity of thirty-six marine motors a day it is quite evident that considerable in the way of facilities are required for testing them before shipment. The accompanying photograph is a panoramic view of the testing room of the Ferro Machine & Foundry Company, Cleveland, O., which forms a building by itself. The view shows no less than fifty motors

TESTING ROOM OF THE FERRO MACHINE & FOUNDRY COMPANY.

being tested out simultaneously, the motors in the center being run from the power generated by two three-cylinder, 25-horsepower Ferro engines shown in the foreground. The lights of engines around the wall are being tested out under their own power. In addition to building complete engines, the company is one of the largest founders of automobile cylinder castings in the country.

### FARM UTILITY OF AN AIR-COOLED CAR.

E. A. Blackshere, who owns a large stock farm near Baltimore, Md., contributes a novel bit of evidence of the utility of automobiles in general and on the "cooling" question in particular. Mr. Blackshere used his car (a Marmon air-cooled runabout) following the workmen in his field during the harvest in July. The motor was run ten hours a day, with one hour's stop for dinner, for five and a half days. The field had grades of 30 per cent. and soft soil, so that the car was never off the low gear for five hours of continuous running each half day. The engine showed no signs of overheating. The thermometer stood about 90 degrees. On leaving the field after five hours' running on the low gear, the car took an 18 per cent. grade on ordinary farm road, twice per day, on the high gear.

Galveston to Have New Garage.—Thomas B. Scott and Gustave B. Koehler have organized the Galveston Motor Car Company, which has acquired the Seixas building, and will thoroughly remodel it as an up-to-date garage.

### HOW PREMIER MOTORS ARE TESTED.

Probably by far the most interesting department of any automobile factory to the layman is what is known as the testing room. Of course, he is interested in being shown the many and varied processes through which the many different kinds of material and the numerous different parts that go to make up a motor have to go through before they reach the end of their goal in the assembling department, and are for the first time brought together in the shape of the complete unit. He is interested, no doubt, but his interest is of a more or less academic nature because to a great extent all machinery looks more or less alike to the unfamiliar eye. It can discern the difference between a lathe and a drill press because one happens to operate horizontally and the other vertically, but apart from such pronounced distinctions as are apparent between two such pieces of machinery as those mentioned, all means little more or less than a slightly different arrangement of gear wheels, cams and levers, the purposes of which are mysterious, to say the least. Truth to tell, he never realized that any of the parts of a motor had to go through such a seemingly endless round of processes and operations before being complete and undertaking its first journey out of the hands of the machinists to the inspection department, and then, if passed, to the assembly department, via the stock room, but most automobile factories work on such a schedule and such a pressure that there is hardly any necessity for this intermediary.

So it is that not until he reaches the testing department does the layman find himself on familiar ground again. Here are the complete motors, anywhere from two or three to a dozen or more, all working away at a great rate, so that it is little wonder that he finds it far and away the most interesting part of the plant. The photographs show what is probably a typical department of this kind—that of the Premier Motor Car Company at Indianapolis, Ind.

This is the last step in the motor's progress through the factory; here the complete motor comes from the assembling department. Prior to actually being tested, it must be run in or "lapped" and this forms no part of the operation of testing, sometimes being carried out in the manufacturing department and at others in the testing room. It consists of turning the motor over slowly by belt in a flood of oil so that the moving parts will accommodate themselves to one another. This finished, the motor then goes to the test block, where it is connected up and run under its own power for the first time. This

CLOSE VIEW OF GENERATOR AND LAMP RHEOSTAT.

is the preliminary test, and throughout its duration the timing of the valves and timer and the efficiency of all its connections are thoroughly inspected. It is then transferred to another block on which it is direct-connected to a dynamo, so that its power output may be measured, a close view of this operation being shown in the smaller picture. The current from the generator is led through various banks of lamps, so that the load may be increased or diminished at will and the output of the motor under both varying and constant load conditions determined. During this test, the working of all its accessories is carefully inspected and adjustments of valves, timer and carbureter made to bring it to the highest pitch of efficiency. Before this it was but an assemblage of parts; now it is a smooth running unit, each part of which works in consonance with the rest. It is now an individual and has assumed a character. The next step is to incorporate it in a chassis and here again it undergoes a thorough inspection and trying out in connection with the other parts of the car. During the course of all its tests it is in the hands of the most experienced and thoroughly capable mechanic connected with the plant and nothing is left undone to make it a perfect and smooth working piece of machinery.

WHERE THE PREMIER MOTORS RECEIVE THEIR FINAL TESTING OUT BEFORE MOUNTING ON CHASSIS.

SIX-CYLINDER, 75-HORSEPOWER, TWO-CYCLE GEARLESS GREYHOUND ROADSTER.

### GEARLESS GREYHOUND MAKES ITS DEBUT.

Though few of the models for 1908 which have already made their appearance are more striking than the aptly-named Gearless Greyhound, made by the Gearless Transmission Company, Rochester, N. Y., probably the first item in the specifications of the new roadster to call for remark, is the fact that there are practically two independent sources of fuel supply, the so-called reserve tank of seventeen gallons, holding as much as is ordinarily carried on many cars as the main supply. Another striking feature is to be found in the advantage that has been taken of the long wheelbase and single seat of the car to provide a double hood with the motor under one and the gear set under the second, so that either of these essentials is very accessible. The power plant consists of a 75-horsepower, six-cylinder, two-cycle engine, fitted with two independent systems of ignition, one of which consists of a Bosch high-tension magneto. The equipment includes a full set of lamps, as shown, as well as a detachable trunk under the rumble seat.

### AL. POOLE WASN'T ABOARD THE SIMPLEX.

Al. Poole, well known as a companion to Joe Tracy in Vanderbilt Cup races, did not have a chance to drive the 35-horsepower Simplex in the recent Fort George hill climb. It seems that Watson and Stark, two testers from the factory, were the ones on the car in the accident which preceded the climb. Poole had not taken his place at the wheel, and the reports involving him in the mishap were croneous. Possessing the excellent reputation of a skillful though fearless driver, Poole does not like to be held responsible for the careless driving of others, and therefore protests at being held in any way responsible.

BOB ALEXANDER TESTING OUT POPE-HARTFORD AT HIGH SPEED.

### EDITOR SOLVES SITUATION.

H. L. Humphreys is the automobile editor of the New York *Evening Post*, one of the most conservative papers of the country. The gossipy material such as finds its way into print in some of the daily papers, in reference to the notables of the automobile trade, is not considered available in the columns of the *sedate Post*. Mr. Humphreys has met the emergency by bringing out an occasional publication called "The Missing Spark," and in its columns he does the jollying act lavishly and thoroughly, and, of course, supplies extra copies to his advertisers and others whom he wants to have advertise.

By this method Humphreys hopes to hold his own against Wetmore of the *Mail*, Morgan of the *Globe* and Curry of the *American*, all three of whom get their "stuff" into print exactly as they write it.

LOGAN MODEL S TRUCK TESTING OUT WITH 7,169 POUND LOAD.

This truck is the newest Logan model for the 1908 market. It will have a rated capacity of three tons, but is tested out with about a twenty-one per cent. heavier load. The makers, the Logan Construction Company, Chillicothe, O., state that it will be a revelation to users of commercial cars.

### ANOTHER NEW BATTERY DISCOVERED.

MILWAUKEE, WIS., Aug. 12.—Frank C. Curtis, of Milwaukee, is the inventor of the latest new type of storage battery that is going to revolutionize things generally and incidentally put the Standard Oil Company out of business, according to the newspaper reports of his discovery. The latter consists of new alloys for the electrodes, as well as a new solution for the electrolyte. In line with the usual newspaper accounts that have characterized similar discoveries in the past few years, it is said to be possible to carry sufficient chemicals under the seat of a car to run it thousands of miles. Fred D. Underwood, president of the Erie Railroad Company; F. C. Rice, superintendent of the Pullman Palace Car Company; A. W. Trenholm, manager of the Omaha road, and other similarly prominent men, are said to be interested in the invention.

### HOW A MAN VISITS "HOME" NOWADAYS.

WILMINGTON, DEL., Aug. 12.—L. H. Green, a prominent resident of New York, came to Delaware a few days ago in his automobile to visit the scenes of his boyhood, near Talleyville. He was accompanied by Mrs. Green and also John P. Green, of Philadelphia. They spent the day touring the section and calling upon Mr. Green's boyhood friends, some of whom he had not seen for many years.

### FUEL CONSUMPTION IN THE A. A. TOUR.

In the hurry and bustle attendant on making controls, not to mention the endless details which the drivers had to attend to, it is hardly strange that few of them ever thought of keeping any individual statistics of the performance of his car. This was not the case with Charles Burman, who drove the number 49 Peerless throughout the tour, and the figures he collected are of considerable interest, particularly those relating to the fuel consumption of the car, which totaled 120 gallons for 1,583.4 miles, or an average of 13.19 miles to the gallon—an unusually favorable showing in view of the nature of the going. The mileage stated seems to have been the actual total distance of the tour, as Mr. Burman's machine made no detours at any time, going directly from one control to the next. The time consumed by the car was 83 hours 55 minutes, although the schedule for the twelve days' running allowed 97 hours. Out of this total running time there was lost for minor adjustments 54 minutes, and for various other reasons, such as tire repairs, fuel supply, putting on chains and enforced stops in order not to pass the pacemaker, 1:43, giving a net running time of 81 hours, 18 minutes. Four passengers were carried through the tour, and, figuring the cost of the fuel at 20 cents per gallon, the expense per mile per passenger for the entire trip was \$0.00379.

### SUPPLY DEALERS TO OBSERVE SUNDAY CLOSING.

As the result of a complaint brought by the Sabbath committee of the Bible House, C. W. LeClear, manager of the Da-An-Nite Supply Company on upper Broadway, was summoned to appear before Magistrate Corrigan in the West Side Court on Thursday morning last to answer to a charge of having sold automobile supplies on Sunday in violation of the closing law. He was found guilty and the magistrate, in suspending sentence, took occasion to warn New York's supply houses against opening on Sunday. Later a formal warning to the same effect was sent out by the Police Department to all the supply dealers along the "row," stating that the law would be enforced. This does not affect obtaining supplies of oil and gasoline by cars regularly stored in garages.

### LOGANSPORT TO HAVE ANOTHER GARAGE.

LOGANSPORT, IND., July 29.—Harry Case has sold out his interest in the Fifth street garage to Arthur and Herbert Dunn, who have leased the ground floor of the adjoining building and will double the facilities of the place, besides purchasing additional cars, to be employed in an auto livery service. Mr. Case will continue as the representative of several well-known American cars in this city and adjacent territory.

VICE-PRESIDENT FAIRBANKS' NEW DE LUXE CAR.

Warren Fairbanks, his son, who is seated in the tonneau, with Mrs. Fairbanks recently drove the car from Chicago to Boston, to attend the reunion of the Fairbanks family, which was held near the latter city.

### LARGE ORDER FOR POPE-WAVERLEY ELECTRICS

No better instance of the manner in which the electric vehicle is gaining ground in the commercial field could possibly be cited than the recent order placed with the Waverley department of the Pope Motor Car Company, Indianapolis, Ind. The Anheuser-Busch Brewing Association, of St. Louis, has long been noted for its modern methods in every department, and its managers were induced to investigate the advantages of electric delivery with the result that an order was immediately placed for fifteen Pope-Waverley electric trucks. Probably the highest compliment that could be paid them was that contained in the few words expressed by Augustus Busch, the vice-president of the association, when he saw the vehicles. "Those are trucks," he said

In fact, they were considered so attractive and such an effective piece of advertising that only thirteen were placed in service in St. Louis while the remaining two were sent to Jamestown as part of the firm's exhibit there. While the vehicles are really light trucks, they are fitted with a special type of enclosed delivery body having rear doors. The motive power consists of 42 cells of 15 plates each, delivering current to two 80-volt motors hung from the chassis and driving to a countershaft through a double reduction; from the countershaft a chain drive is taken to the rear wheels. This power plant has proved itself capable of the most exacting demands of a quick delivery service in and around St. Louis. The wheels are 36 inches in diameter and are fitted with solid tires, 4 inches front and 5 inches rear.

THREE OF THE FIFTEEN POPE-WAVERLEY TRUCKS RECENTLY SUPPLIED THE ANHEUSER-BUSCH BREWING ASSOCIATION, OF ST. LOUIS.

SPACIOUS NEW GARAGE AT PORTSMOUTH, N. H.

## THE EVER-INCREASING GARAGE LIST.

### Modern Automobile Garage Secured by Portsmouth.

PORTSMOUTH, N. H., Aug. 12.—A spacious fireproof automobile garage, with a frontage on Fleet street of 90 feet and a depth on Porter street of 112 feet, was recently opened here. The building, which is one story high and 17 feet in height, is entirely of steel, brick, concrete and glass. The last named enters largely into its composition, for, besides being extensively used in windows and doors, there are about 50 square feet in two skylights in the roof. The gasoline supply is conveyed into the building through pipes leading from two cylindrical tanks, each of 300 gallons capacity, which, to guard against accidental explosion, have been placed underground outside the wall in the rear. The garage is lighted by electricity.

### Street Car Barn to Give Way for Garage.

WHEELING, W. VA., Aug. 12.—R. J. McCulloch, who has long been identified with the automobile business here, is now having built a modern garage on the corner of Sixteenth and Eoff streets—the site of the old street car barn that has so long been an eyesore to the population of Wheeling. Jason C. Stamp is said to be associated with Mr. McCulloch in the enterprise, which, when finished, will be one of the finest establishments of the kind in the State. The building is centrally located and will have a frontage of 100 feet on Sixteenth street and 70 feet on Eoff, providing accommodation for fifty large cars, in addition to a completely equipped repair shop, which will be kept open night and day.

### Rockford to Have a Modern Garage.

ROCKFORD, ILL., Aug. 12.—Ground has already been broken for the construction of a modern garage building for Robert A. Smythe, who has the agency here for the Pierce and Maxwell cars. The building is to have a frontage of 70 feet on Eighteenth street and a depth of 35 feet, the façade being of pressed brick with vitrified brick trimming. It will be two stories high and the main floor will provide accommodation for about 25 cars, beside which complete repair facilities will be installed. Mr. Smythe has been handling cars here for the past six years and is at present located at 225 Eighteenth street, but expects to move into his new building about September 1.

### Up-to-date Auto Station Opens in Reading.

READING, PA., Aug. 12.—The garage of the Berks Automobile and Garage Company, which is one of the best equipped plants of its kind in Pennsylvania, is now in full swing. The building is a two-story brick structure, measuring 40 by 131 feet with an L 60 feet in depth. It is of modern construction throughout, with cement floors, electric light and electric elevators, and is provided with every facility both for the handling of cars and the con-

venience of the customers of the establishment. For the benefit of the latter a large waiting and show room, finished in Mission, has been fitted up on the first floor, as well as baths for both men and women. The garage proper has accommodation for fifty large cars, in addition to which a most complete machine and repair shop has been installed. The firm handles the Jackson, Maxwell and Stoddard-Dayton cars in this territory, and also does a renting business.

### Columbus Garage Quietly Changes Hands.

COLUMBUS, O., Aug. 12.—S. Evans Hodge and C. R. Clough have organized the Southern Garage Company to take over the plant and business of the Imperial Garage Company, at 35 West Mound street, which recently made an assignment to C. H. Davis. The latter has been lifted, and the company will refit the establishment, improving its facilities, besides adding a complete line of automobile supplies and accessories.

### Ashland Garages Now Combined in One.

ASHLAND, O., Aug. 12.—E. C. Overs, who conducted a garage on Second street for some time past, has sold out his establishment to Burt Richards, who has the agency for the Jackson and Ford cars here. With this increase in his facilities Mr. Richards has as complete an automobile station as is to be found in any of the smaller towns of the State.

## NOTES OF THE GARAGES.

Bangor, Me.—Treat & Nash have recently installed at their garage, on Palm street, a charging plant for storage batteries, as well as a tire vulcanizer.

San Antonio, Tex.—The American Automobile Company will open a new and up-to-date garage on Losoya street towards the end of May.

Washington, D. C.—The Washington Garage Company has been incorporated with a capital stock of \$150,000, comprising 1,500 shares of the par-value of \$100 each.

Gettysburg, Pa.—George F. Eberhart, proprietor of the Gettysburg Motor Car Company, is making extensive improvements in his garage on South Washington street.

Coldwater, Mich.—W. S. Farrand is building a garage 50 by 70 feet. Construction is concrete throughout, with iron trusses and no center posts. There will be a first-class repair shop.

Columbus, O.—Plans have been completed for the erection of a modern garage by O. G. Roberts & Company on East Gay street, between Seventeenth street and Miami avenue.

Massillon, O.—An automobile garage is being erected in Oak street, just to the rear of the Segner block, by E. C. Segner, who hopes to have the place ready shortly.

Youngstown, O.—A first-class automobile garage and club-room will soon be opened by John Euwer and Powers Smith, who are taking over the agencies and business of E. Hippard in North Phelps street.

Fargo, N. D.—John Hass will erect a one-story automobile garage on Second avenue North, with foundations strong enough for a three-story structure to be put up later. The premises will be occupied by Hector Barnes.

Owensboro, Ky.—With a capital stock of \$10,000, divided into 100 shares of the face value of \$100 each, the Owensboro Automobile Company has been formed and has secured a large garage at the corner of Fourth and Frederica streets.

Milwaukee, Wis.—Now established in its new garage on Eighth street, just south of Grand avenue, the McDuffee Automobile Company is preparing to hold a reception to its new home. The garage, one of the finest in the city, holds seventy-five cars.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Kenosha, Wis., is soon to have another automobile factory, the Orr Motor Car Company, which was recently organized with \$25,000 capital, having decided to establish its plant there.

The Connecticut Telephone and Electric Company state that at the Atlantic City meet, August 5-7, cars equipped with Connecticut coils secured the greatest number of events, having won fifteen firsts, nine seconds and six third places.

Additions to the plant of the Royal Motor Car Company, Cleveland, O., which are being rushed to completion by the contractors at the new site on East Seventy-second street, near the L. S. & M. S. Ry., are expected to be ready for occupation by September 1.

The Holsman Automobile Company, of Chicago, has moved its offices from the sixth floor of the Monadnock block to the fourth floor of that building, where the entire end of the building has been secured, giving the company more than double its former floor space.

The Logan Construction Company of Chillicothe, O., maker of the Logan "Blue Streak" semi-racer runabout, is elated over the selection of the board of public safety of Akron, which has ordered for the use of Chief T. Mertz, of the fire department, one of the Logan runabouts. A half dozen concerns sought to have their cars selected.

Interest attaches to the report of the incorporation of the New York & Philadelphia Automobile Company, recently organized under the laws of the State of New York, with a capital of \$25,000. The purpose is to deal in automobiles, and the incorporators are J. W. Spalding and William T. Brown, of 126 Nassau street, New York City, and James M. Carrington, of Long Island City, N. Y.

California is to have another automobile factory, which will be located at San Diego. Full particulars regarding the new establishment are lacking, but it is understood that local capitalists are backing it for the purpose of developing a new invention in the automobile line. It is said that \$15,000 worth of machinery has already been ordered, and when running the plant will employ between 100 and 200 men.

That the expense of automobile travel is very much overrated is amply shown by the experience of D. E. Levy, a New York broker, who recently drove his Matheson from New York to Chicago and return with a party of five. The chief items of the account are: fuel, \$51.39; oil, \$12.40; storage, \$13; washing, \$12; polishing, \$4.25, and kerosene, .75, making a total of \$93.79. This figures out at the rate of three cents a mile for the entire party, or five mills per mile per passenger.

The authorized capital stock of the Hartford Auto Parts Company, a Connecticut corporation, has just been increased from \$10,000 to \$35,000. The company was organized early in 1906, at Hartford, to manufacture a line of automobile parts, but its facilities thus far have only permitted the manufacture of a special type of universal joint, known as the "Hartford," which is dis-

tinguished by the use of hardened ball and socket bearings and a new form of all-metal casing. The increase in capital is to provide additional facilities in the machinery and special tool equipment of the factory at Hartford, Conn.

It is announced that the show committee of the Importers' Automobile Salon has settled upon the style of decorations and general plans for the arrangement of the importers' show, which is to be held in Madison Square Garden, New York City, beginning December 28. Clinton R. Mabley, the general manager of the Salon, states, however, that no public announcement of the plans will be made until the return of several members of the Salon, who are now in Europe.

A handsome lithograph banner is being sent out by the Continental Caoutchouc Company, 43 Warren street, New York, J. M. Gilbert, general manager. It represents a landscape scene, with a lake and mountains in the distance. In the center of the picture is shown a touring car, and alongside the roadway is a signboard advertising Continental tires. The banner is prepared in such an artistic way that at a short distance it resembles an oil painting. It is intended for automobile clubs, garages, and automobile show rooms.

New York autoists who enjoy an occasional burst of speed in the open country should be careful not to indulge in this pleasure on the Sawmill River road around the towns of Ardsley, Elmsford and Briarcliff. It was at Briarcliff that John D. Rockefeller was arrested and fined \$30, and prominent autoists have suffered considerable annoyance and delay along this particular stretch. Beyond Briarcliff, all traps cease, and the traffic on the highway is so slight that a fair speed may be maintained.

Owing to the enormous growth of the W. D. Newerf Rubber Company, which was recently opened in San Francisco to handle Goodyear tires exclusively, it has been found necessary to incorporate with a capital of \$100,000, fully paid up. The business of the company has more than doubled in the past year and, with new stores in San Francisco and Fresno, and agents in Portland, Ore., Seattle, Wash., San Diego, Riverside and many other California and coast towns, this will doubtless be surpassed during the coming year. The San Francisco headquarters are at 506 Golden Gate avenue, and though but recently opened, it has done a remarkable business in Goodyear tires.

The trite old saying, "Man, know thyself," should, as far as some autoists are concerned, be transposed to "Man, know thy car," says a well-known Columbia dealer. "It is really surprising how many owners know but little of their machines and when beset with troubles are utterly helpless. When a man comes into our establishment and buys a car we do everything possible to school him thoroughly, so that when thrown upon his own resources he will get along smoothly, and have found that the plan works well. Recently a customer of ours purchased his first car and, after a course of thorough instruction, from us, went

his way. Subsequently we heard from him in another part of the country, and he stated that he experienced no trouble whatever in operating the car himself, owing to his early teaching."

### NEW AGENCIES ESTABLISHED.

Olier & Worthington is the title of a firm just organized in Los Angeles, Cal., to handle various lines of automobile specialties and supplies on the Pacific coast. They will act as manufacturers' agents. Both members of the new firm are well known in the auto accessory trade.

The Colt Runabout Company of Pennsylvania has just been formed by William M. Edison and Hays M. Fernald to handle the 40-horsepower, six-cylinder Colt runabout in that State. An agency will be opened at the Bellevue-Stratford garage in Philadelphia, and in the near future an office will be established in Pittsburg. Mr. Edison is a son of Thomas A. Edison, the inventor.

The Calhoun-Bancroft Company, Seattle, Wash., has just been organized to handle, as direct representatives of the makers, a line of automobile accessories, and particularly ignition apparatus, on the North Pacific Coast, their territory including Washington, Oregon and British Columbia. Mr. Calhoun is an expert electrician and battery man and Mr. Bancroft has had considerable experience in the general supply line, having formerly been with the Motor Car Supply Company and the Franco-American Auto Supply Company, both of Chicago.

### PERSONAL TRADE MENTION.

George Arbuckle, western supervisor for the Winton Company, has returned to Cleveland, after a three months' trip to Pacific Coast points.

Thomas Moore, for several years publicity manager for Wyckoff, Church & Partridge, New York City, has resigned his position with that house, with a view of connecting himself with a factory.

Peter S. Steenstrup, of the Hyatt Roller Bearing Company, Harrison, N. J., will sail August 28 for a European trip in the interests of the Hyatt bearings. He will visit Great Britain and the Continent.

F. A. Babcock, Jr., sales manager of the Babcock Electric Carriage Company, of Buffalo, started late in July on a trip to visit the agencies in the West. He will go as far as San Francisco and then up to Seattle. From the Middle West he writes that the outlook for increased business, not only in the electric line, but in the others, is very promising.

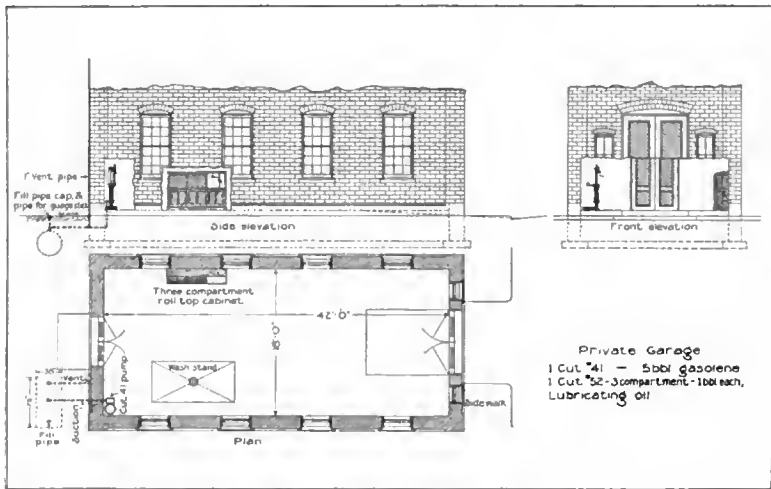

### "NED" BROADWELL, FISK SALES MANAGER.

E. H. Broadwell, head of the Detroit branch of the Fisk Rubber Company for a considerable period, is to make his future residence at Chicopee Falls, Mass., where he will be the general sales manager of the Fisk Company. Widely known and with years of experience, Mr. Broadwell is particularly well fitted for his new place.

INFORMATION FOR AUTO USERS.

**Up-to-Date Gasoline Storage.**—Owing to the frequency with which S. F. Bowser & Company, Fort Wayne, Ind., have been called upon by architects, builders and owners to furnish plans for the installation of gasoline and lubricating oil storage equipment, they have decided to publish the data gathered in

chine may be connected up and the switch set to open as soon as it is fully charged. The Ward Leonard Electric Company makes these rheostats in various styles, adapted for mounting on the back of a switchboard, on a wall or on the floor, their list including four different sizes.

SPECIMEN PLAN OF BOWSER MODERN GASOLINE AND OIL STORAGE.

16¾ inches wide and 17 inches high, including flywheel, it shows 10-12 horsepower on actual brake tests. It is made of the same materials and with the same attention to detail that has always characterized the four-cylinder motors turned out in numbers by this company. In testing, it has been run under full load for a period of six hours without showing any signs of overheating. The crankshaft is a drop-forging of liberal dimensions, made from high-grade steel and finished by grinding, which is also true of the piston and piston rings. The connecting rods are of special carbon steel. The wrist pins are ground and run in plastic bushings of superior quality. The inlet valves are of the automatic type, and the exhaust valves are mechanically operated. Timing gears are of hard bronze and steel, accurately cut from the solid and run in oil. In short, the design and construction of the new De Tamble buggy motor is such as to fit it for constant hard service in the hands of inexperienced operators. The motor complete, including flywheel, tips the scales at 185 pounds, and its compact design may be judged from the accompanying illustration.

**The Petite Safety Switch.**—Every autoist knows the inconvenience of having to lean over to reach a switch on the coil box, or some other equally inaccessible position, in order to stop the car or to cut out the engine on a long coast, or any one of the

complying with these numerous requests in book form. This has recently been done, the work being entitled "Plan Drawings of Model Oil Storage Systems," and, as its name indicates, it is chiefly devoted to illustrating actual installations that have been carried out, all necessary dimensions being given.

The following table gives the capacities and resistance of the four sizes listed:

No. of Cells	Charging Current	Resistance
Low-est.	High-est.	Maxi-mum.
1	44	20
1	44	40
1	44	60
1	44	80

HOW THE PETITE IS OPERATED.

Every phase of the subject is treated, both from the point of view of the private owner as well as for the benefit of public garages of every size, tank capacities and dimensions, sizes of oil houses, pipe layouts and all other necessary data for the equipment of garages, factories and stores with gasoline and oil-handling devices being provided.

**De Tamble Buggy Motor.**—In response to the widespread demand for the buggy type of automobile, the Speed Changing Pulley Company, Indianapolis, Ind., is just placing on the market a light, powerful and smooth-running air-cooled motor specially designed for this service, as well as for light delivery wagons. Although its dimensions are only 30 inches long by

numerous occasions on which it is not alone convenient but helpful to both driver and motor to be able to cut out the latter. Racing drivers have long recog-

The plan shown herewith is a reduction of one of many drawn for a private garage, and shows the position of the buried tank, size of hole to be dug and space occupied by pumps for both oils. Other plans illustrate the arrangements of a number of both private and public garages. Copies of the book will be sent gratis on application to the publishers.

THE NEW DE TAMPLE AIR-COOLED MOTOR FOR BUGGY USE.

**Battery-Charging Rheostats.**—In the average garage there is always apt to be considerable difference in the number of cells in the batteries of the cars to be charged, and the problem of handling the current so as to give each the proper amount of current through the charge has been an annoying one to the garage manager. To meet this condition the Ward Leonard Electric Company, Bronxville, N. Y., has developed a line of rheostats suitable for charging batteries having any number of cells, from 1 to 44, at any amperage between maximum and minimum charging rates of from 2 to 80 amperes. Another great advantage of these rheostats is the addition of a combination overload and underload circuit breaker, which will not only protect the machine during the charge but automatically open the circuit upon its completion, so that a ma-

nized this, and the majority of cars in the long road races have been equipped with small switches mounted on the steering wheel. Under the name of the Petite switch, the American Motor Works, of Grand Rapids, Mich., are placing a device for this purpose on the market. As its name indicates, it is extremely small and unobtrusive and it may readily be applied to any car without trouble, but one screw being necessary to fasten it, and, as the makers also state, it is always "right under your thumb," instantly ready for an emergency stop. The skillful driver not only saves gasoline, but he also saves his batteries, and this is his most valuable aid in accomplishing both, there being a great many times when it is safer to have the car turning the engine over than the reverse. But more than either of these, it saves tires, because it means a great deal whether the rubber is merely rolling over an obstruction or dropping into a hole or whether it is being forcibly dragged or pushed through these tire-destroyers.

**Bullard Speedometers.**—For the 1908 season J. H. Bullard, Springfield, Mass., will market two types of the well-known speedometers that bear his name. Both are now ready for delivery, and the chief feature of one will be its equipment with a maximum hand, so arranged that by pressing a button, not shown in the illustration, it will remain stationary at the maximum speed, and by releasing the button it will instantly return to the speed at which the car is then traveling. The advantages of this construction are that it does not bring any drag on the regular recording hand nor impair its accuracy to the slightest degree, and it is as free and as sensitive to the speed changes as though this extra hand were not a part of the instrument, nor does jolting or jarring affect it in any way. At the same time it does not complicate the instru-

THE NEW BULLARD FOR 1908.

ment in any manner, and, except when the button is called into play, it operates exactly in the usual manner, as if this additional hand were not present. By this construction there is no second hand to watch and no possibility of forgetting to release it at the proper moment, as a glance is sufficient to show whether it is free or locked. The other type is the usual style, without the addition of the maximum hand, and both are made with

ELEVATION AND CROSS-SECTIONAL VIEW OF THE WARNER FRICTION CLUTCH.

the same painstaking attention to detail and accuracy that has always characterized the Bullard. In operation, the shaft only turns one and a half times faster than a 30-inch wheel, thus making all the parts very slow-moving. The shaft is attached to a patented universal bracket, and can be applied to any car so that all short bends are avoided, thus insuring long life to all the parts and connections.

**New Type of Auto Horn.**—Among the catalogues just to hand is one of the Automobile Supply Manufacturing Company, Driggs avenue, Brooklyn, N. Y. It is devoted to the

OVAL BELL HORN WITH CLOSE COIL.

line of automobile horns turned out by this firm, and shows a wide range of styles and types, including ten newcomers and one wholly new design, which is the work of Louis Rubes, the president of the company. The accompanying illustration shows a sample of the oval-bell type horn, with "close-twisted" coil, which gives a rich, penetrating note that carries to a considerable distance. The extent of the demand for the line of horns turned out by this firm may be gauged from the fact that overtime work is being carried on at both of its plants at Driggs avenue and Emerson place, Brooklyn.

**New Warner Friction Clutch.**—Sudden gripping, binding tight or becoming so loose as not to transmit more than a fraction of the power of the motor, are some of the ills that the ordinary type of friction clutch is heir to. In contrast with this, the Warner

Clutch Company, 1461 Michigan Avenue, Chicago, Ill., has been marketing a type of clutch which not only eliminates these ills, but also provides insurance against damaging either the car or the tires by means of its ability to let go when the occasion demands, as well as to engage easily and hold fast regardless of how much power the motor is developing. It consists of a series of crucible steel springs or bands in frictional contact with the polished surface of a cast-iron drum, the whole being enclosed in a dustproof case and running in an oil bath. The steel bands are designed to transmit the power of the most powerful automobile engine made, while the drum is glass hard, so that the wear is practically a negligible factor. Provision is made for adjustment in the shape of compensating screws, one or two turns of which are sufficient to take up any play after a season's use. The steel bands are good for two or three years' steady service and can be replaced at trifling cost, thus making the clutch as good as new. As the makers state, "When properly adjusted the Warner clutch, when it is 'all in,' will slip just below the breaking strain of the weakest point in the system of which it is a part, and its frictional resistance should be set slightly below that of the driving tires on a dry road or street pavement."

**NEW BOOKLETS RECEIVED.**

"Lytle's Great Run" is an illustrated folder dealing with Herbert Lytle's last and most notable performance on a track with a Pope-Toledo car. It can be obtained from the Pope Motor Car Company, at Toledo, or from their agents.

Safety when automobiling, due to the absence of skidding and tire weakness, forms the theme of "Safe and Sane Automobiling," a booklet published by the Leather Tire Goods Company, Newton, Upper Falls, Mass. The Woodworth tread is the safety factor offered by the authors of the book, the claims of which are strongly presented in the 16 illustrated pages.

With the object of making known the attractions of the lake country of central New York, a well-prepared guide-book for the automobilist has been published by the Glen Springs Garage, Watkins Glen, N. Y. The country from Binghamton to Buffalo is dealt with and a large number of excursions from Watkins Glen to points of interest are mapped out. The book contains road maps, road directions and views of the country traversed.

INDEX TO ADVERTISERS

Table listing various manufacturers and their page numbers, including entries like 'Acetylene Gas Illuminating Co.', 'Holley Bros. Co.', and 'Nuttall Co., R. D.'.

The Safest Way to Store Gasoline

is the NATIONAL way, is the only economical, safe and convenient way, because there is no danger, no evaporation or waste, the gasoline is in the tank or in the car.

The NATIONAL is the only pump that discharges gasoline at every movement of the crank, it saves one half the labor and one half the time to pump gasoline, there is no evaporation or leakage, the tank is buried underground, the pump may be put in the building in a convenient place. It is the safest way because it meets all of the requirements of The National Board of Fire Underwriters.

The NATIONAL is also adapted to private motorist, also for lubricating oil storage. Ask for catalogue, it will explain all about the National System.

The National Oil Pump and Tank Co., Dayton, O.

# THE AUTOMOBILE

LISIEUX, FRANCE, Aug. 9.—Eugene Renaux, driving a Peugeot, has captured the Press Cup—Coupe de la Presse in the language of the country—on the Lisieux circuit at an average of 53.7 miles an hour, defeating twenty-five cars from the best European factories. A Westinghouse, driven by Vimont, came second, at 53.03 miles an hour; Zèlèlé, the Abyssinian driver of a De Dion Bouton, obtained third place with an average of 51.5 miles, and his companion, Vrignon, with the same make of machine, got fourth place at an average of 50.7 miles an hour. Eighteen out of the twenty-six starters finished the 243.8 miles, the last to arrive averaging 40 miles an hour.

Compared with the Grand Prix there is nothing startling in the speeds realized on the fast Lisieux circuit, 53.7 miles an hour seeming slow going after the 70.6 of Nazarro. But the Press Cup, though awarded on speed attained, is not a pure speed event. Marquis de Dion, who has small belief in the industrial value of racing, proposed an endurance test for touring cars, and after much insistence obtained the support of the Automobile Club of France for its organization.

Touring machines weighing not less than 3,637 pounds, with four passengers of 154 pounds each on board, but without baggage, tires, or any spare parts, and conforming to certain chassis dimensions, had to accomplish a four-day tour of 960 miles at an average of 21 to 24 miles an hour. Those coming through the touring event on schedule would be allowed, without any change in their gear, to start in the speed test—the Press Cup—on a guarded circuit, with a fuel allowance of 4.1 gallons of gasoline per 62.1 miles.

On the second day of the tour a deplorable accident costing seven lives caused the Minister of the Interior to order the tour stopped. The sad event proved that, in France, touring competitions on unprotected roads are more dangerous than high-speed contests on military guarded circuits. Those having qualified on the first two touring stages were ordered, after the accident, to proceed to Trouville and hold themselves in readiness for the speed test.

They were twenty-six in number, all French, that gathered at 9:45 A.M. for the five rounds over the 48.7-mile circuit. Although the fuel allowance of 16.3 gallons for the total distance, the minimum weight and the obligation of carrying four passengers, brought the competitors to a common basis, there was a large amount of diversity in the machines.

C. G. V. entered a handsome limousine with inside steering, and took four ladies as passengers; during the tour the car was able to hold its own, but it was obviously impossible to compete on equal terms with the others when speed alone decided. The

THE STORM WHICH FOLLOWED THE RACE'S CONCLUSION.

others, all side-entrance touring cars, adhered more or less closely to standard models. Mud guards generally were reduced to their lowest dimensions and in a few cases replaced by horizontal canvas guards, running boards were in some cases of wood, and a few of the chassis were drilled. Such changes were allowed, provided the weight did not fall below the minimum. Particular attention was paid to the gearing, any increase on the gear examined when the cars left Paris causing disqualification. Gasoline tanks for the occasion had to be carried behind either the front or the rear seats, where, being always visible, the chance of fraud was considerably diminished.

### Cup Commission Did Not Favor a Daybreak Start.

It was not the crowd one usually meets at an automobile race—or, rather, it was the same crowd under a different complexion. No necessity to sit up all night to be sure of a place at the starting line at dawn, for the race began at 9:45, after the ladies had donned their most elegant costumes and everybody had eaten a hearty breakfast. It was really a sensible move, for the machines which were to race were touring models, and those who watched them in their magnificent struggle were the people most likely to become their possessors. The promoters of the Press Cup have first had the sagacity to realize that an audience at an automobile race has as much right to good treatment as any other class of probable clients.

Molon's Gladiator had the honor of starting the match, his departure coinciding with the flight of a large red balloon. Two minutes later the imposing Barriaux, with a Motobloc, the tires of which were filled with Elastes, departed, the first driver for many a year to use other than pneumatic tires in a race. De La Touloubre, under which name Captain Genty, head of the army automobile corps, vainly hides his identity, received a special ovation, for his departure had been doubtful. After the accident on the tour, gendarmes held him up for several hours and prevented him reaching control on time; but when the committee had considered his case, it was decided to allow him to start in the race.

SOREL'S DIETRICH, DEFEATED FOR LACK OF GASOLINE.

Regularly, at two-minute intervals, the four-passenger cars went away in as imposing a manner as any collection of racers in an international pure speed test. Each car, after being filled with gasoline, was dragged to the line by a horse, and the motor cranked at the last possible moment, gasoline being a precious fluid with such an extremely limited allowance.

All in white, with the arms of the firm painted on the side panels, the De Dion Bouton team attracted particular attention. Zèlèlé especially being pointed out. Zèlèlé is one of the sights of Paris. On working days he drives the Marquis de Dion's limousine around the city. Zèlèlé's companion on the front seat is a handsome Pomeranian, white from the tip of its nose to the wag of its tail; Zèlèlé's color being, as everybody knows, as coppery as Abyssinia can produce, the combination was declared *tout à fait chic*, and Pomeranians on the front seat are now the fashion.

Sorel's Lorraine-Dietrich was looked upon as one of the most probable winners. Sorel, an Anglo-Indian, is one of the most capable drivers Europe possesses, and his machine, a standard model, has been more carefully prepared for the race than the majority. The two Westinghouses, built at Havre, but with just a tinge of American blood in them, made excellent starts. Mercedes was the only out-and-out foreigner, the others from abroad having fallen during the preliminary tour.

Sorel, driving a Dietrich, was the fastest on the initial round, followed at an interval of two minutes by Renaux on a Peugeot, and one minute later by Vrignon on a De Dion Bouton. Another Peugeot was fourth and two De Dion Bouton's fifth and sixth. At the end of the third round Sorel was still leading, with Peugeot a good second and the complete De Dion team hanging very close. Excluding accidents the De Dietrich machine seems a certain winner, for it was decidedly the fastest of the lot and was admirably handled. There was a doubt, however, as to the ability of the big four-cylinder motor with 5.1 by 6.2 bore and stroke to

ARIES DRILLED THE FRAME AND FITTED A WIND DEFLECTOR.

remain within its fuel allowance. The Peugeot dimensions were 5.1 by 4.7 bore and stroke and the De Dion engines were 4.3 by 5.9 bore and stroke.

#### How Some Were Eliminated by Accidents.

On the fourth round Perret's Peugeot took a dip in the road at too high a speed and broke a front spring hanger; the Mercedes driven by Gasteaux, with Madame Gasteaux as one of the passengers, broke a ball bearing and had to retire; a Cottin-Desgouttes broke an axle and the M. G. R. and the Vinot-Deguingand had to lay up on the roadside. Sorel and Renaux, handling Dietrich and Peugeot respectively, continued to lead and appeared likely to obtain first and second positions. Debray's closed C. G. V., with its full load of passengers, continued in the rear with an even speed of thirty-seven miles an hour.

About 2:30 o'clock Vimont on a Westinghouse crossed the finishing line. He had started eighth and consequently should be in a good position. One of the Gladiators came in close behind, with Zèlèlé, the Marquis de Dion's private chauffeur, who had driven too cautiously on a guarded road, hard on his heels. But Sorel's Dietrich was the machine looked for by every spectator, its previous lead having marked it out as a certain winner. From the telephone station the sorrowful message came that the powerful Dietrich was laid up on the roadside with every drop of gasoline drained out of its tank. Renaux, whose Peugeot had not stopped once for tires—he used Continentals—or any other cause, went over the line in 4:32:56, winner of the Coupe de la Presse. Less than four minutes behind, Vimont's Westinghouse took second place and De Dion Bouton captured third and fourth. The third De Dion, while in a good position, ran out of gasoline and had to be pushed over the line. Cottin & Desgouttes, finishing fifth and ninth, obtained the gold medal for the lowest fuel consumption. One of the most pleasing features of the race was

C. G. V. INSIDE STEERING LIMOUSINE, WHICH TOURED AND RACED.

MARQUIS DE DION'S OWN CAR AND COLORED CHAUFFEUR.

the excellent work done by tires; in addition to the winner, several machines covered the 244 miles without changing a single shoe. Dismountable rims, Vinet and Michelin, were used on every machine, and Bosch magnetos were found on twelve of the eighteen finishers.

**An Excellent Race, but Might Have Been Better.**

Critics are not altogether satisfied with the speed realized by the machines with their allowance of one gallon of gasoline for approximately 15.3 miles. Compared with the Berliet record from Biarritz to Paris, and the performance of Rolls in the Tourist Trophy, there has not been much progress. Probably owing to the late appearance of the regulations, constructors had not thoroughly worked out the problem of obtaining the highest speed with the least amount of gasoline under touring conditions. All the machines were in good racing trim and handled by experienced drivers, but did not seem to have received the attention they ought to have had on fuel supply. Horsepower varied from 28 to 45; or, to get a more accurate estimate, for horsepower is often a matter of geography, bore and stroke was 4.3 by 5.1 on the smallest cars and 5.2 by 6.2 on the most powerful engines.

The regulations made it impossible for freak machines or specially constructed racers to compete. Although wire wheels sometimes took the place of wooden ones, and tricks were played with mud guards, the machines had to keep closely to touring conditions. Most important of all, they had to be geared for the

VICTORIOUS PEUGEOT CROSSING THE LINE.

contest on the Dieppe circuit. Over 2,000 troops guarded the course, barriers were erected each side of the road for the entire distance, and bridges put up wherever the population was of such importance as to need it. Though rather narrower than the majority of French roads, the Lisieux circuit has uniformly good surfaces, and was so carefully oiled and prepared that it formed an ideal track. It was at the grand stands that the work of the organizers was seen to the best advantage. Instead of placing

A SCENE AT THE STARTING LINE. ELEGANTLY DECORATED GRANDSTAND AT BEND OF ROAD ON LEFT; TIMER'S BOX ON RIGHT.

race in the manner which they competed in the touring event over mountain districts. For the first time in a touring race dismountable rims were used exclusively and gave no trouble. Continentals equipped the winner, the third, fourth, eighth, tenth, twelfth and fourteenth machines. Michelin's place was on the second and fifth cars to reach the grandstand.

**THE FINISH AND THE SPEED.**

Car and Driver	Time	Speed per hour
1. Peugeot, Renaux .....	4:32:56	53.7
2. Westinghouse, Vimont .....	4:36:05	53.03
3. De Dion Bouton, Zélélé .....	4:44:46	51.3
4. De Dion Bouton, Vrignon .....	4:48:40	50.6
5. Cottin & Desgouttes, Cottin .....	4:53:13	49.9
6. Westinghouse, Burkhard .....	4:53:53	49.5
7. Gladiator, Molon .....	4:57:12	49.4
8. Eugène Brillé, Hérissé .....	4:59:28	48.9
9. Cottin & Desgouttes, Latune .....	5:04:06	48.1
10. Gobron, Dureste .....	5:06:07	47.8
11. Gladiator, Voniatum .....	5:06:07	47.8
12. Ariès, Vallée .....	5:17:00	46.1
13. De Dion Bouton, De Marcay .....	5:23:24	45.2
14. Motobloc, Barraux .....	5:27:27	44.7
15. Peugeot, Perret .....	5:52:05	41.5

Also finished: Rebour, Riviere; C. G. V., Debray; and Gillet-Forest, Nemo.

**Organization the Most Perfect Europe Has Ever Seen.**

Nothing but praise is heard for the manner in which the race over the Lisieux circuit was conducted. The Grand Prix, marvelously organized, captivated strangers by the manner in which the race was planned and attention paid to details. But the event just over was, in the opinion of all, far in excess of the

stands on a straight stretch of road, they were erected on a slight bend, thus giving spectators an opportunity of seeing the work of the drivers under the most interesting conditions. To enhance their speed, the road was banked at this point; thus the cars were visible several miles down the road, could be seen taking an elongated S turn, watched closely on the grand stand turn and seen as they disappeared a couple of miles in the distance, there being no dust to obscure the view.

A complete town of wooden "villas," as they were immediately

ZÉLÉLÉ ON DE DION BOUTON FINISHING THIRD.

THE MODERN AUTO IN OLD-WORLD NORMAN TOWN.

dubbed, was erected to the rear of the grand stands. The Sporting Commission had a "château," the A. C. F. committee possessed its "castle," the telegraph and the general secretary were each accommodated with a handsomely decorated "villa," and the timer was given an elegant glass-and-wood house on the starting line which would not have dishonored the grounds of a millionaire. Instead of a shed from which no view of the course could be obtained, the press had for its special use a well-con-

FILLING WITH GASOLINE FROM SPECIAL MEASURING TANK.

structed tower, fifty feet from the ground, where it was possible to see everything and send messages without making 100-yard sprints. Finally, the restaurant was a place to eat in, and a place where people really did eat with pleasure. Gustave Rives, the master hand of the Paris automobile salon, had charge of the decorations around the stands. As an example of the manner in which he performed his task, it is only necessary to mention one detail. On the barricades were, as usual, advertisements for so

STOUT BARRIERS AND BRIDGES MADE THE RACE SAFE FOR ALL.

and so's tires and oils; these had to be of an approved color to harmonize, and when there were no more advertisements the bareness of the boards was hidden by an artistic wall paper, giving a panel effect. Cushioned seats, draped walls, artistically painted stands, were all in evidence; but, most important of all, the stands and other buildings had been designed first for use, then decorated. On some previous occasions the stands were made to fit the decorations.

Progress had been made also in handling the score. From the timers' box, placed on the finishing line, it was but a step to a large, clearly visible score board, on which elapsed times only were posted—not clock times, as formerly. Filling the cars with gasoline was but a repetition of the Grand Prix. Two measuring tanks built to make allowance for changes in temperature were mounted on a platform, filled with the requisite amount of fuel, and their contents emptied into the tank of each competitor, the whole operation occupying less time than the filling of the average gasoline tank in a garage. When filled the inlet cap was sealed down and the various scales imposed at Paris finally verified.

#### How the Tour Met with Disaster.

Starting from Paris, after being weighed in and having their tanks and gear cases sealed at the military station on the Quai d'Orsay, the forty-four competitors in the Criterium de France and Coupe de Presse made the 270-mile run to Clermont-Ferrand, in Auvergne, at an average of 24.8 miles an hour. Although traffic and pavé around Paris made speed impossible for the first few miles—the start was given in the city itself—and a respectable share of hills were met during the latter half of the journey, every machine reached control on time. Many of them, indeed, arrived from one to two hours ahead of schedule. No half-way control had been arranged, but so fast was the rate of travel that it was considered necessary to hold up the competitors at Nevers. One well known make of machine covered the entire distance at 50 miles an hour, while half a dozen others exceeded an average of 45 miles an hour.

From Quatre-Routes, a corner of the Gordon Bennett Auvergne circuit, the second day's tour was to Bordeaux, 224 miles away, on a schedule calling for 21.7 miles an hour. Being through a mountainous country, greater caution was needed and a lower average speed was asked for. This, however, did not prevent the competitors from speeding, and most of them set up an average which would have carried them into the wine city far ahead of schedule. About twenty miles from Bordeaux the rear of No. 31 Martini suddenly collapsed while traveling at a moderate speed on a straight, level road. M. Meurisse, THE AUTOMOBILE photographer in France, who occupied a seat in the tonneau, was thrown into a field and slightly bruised. His companion, M. Luquin, a photographer from *La Vie au Grand Air*, was thrown in another direction, struck a telegraph post, and was killed on the spot.

On the news reaching Bordeaux, M. Roullier set out on a Peugeot car with a number of newspaper men to obtain details of the accident. Traveling at nearly forty miles an hour, Roullier passed a horse-drawn vehicle in a cloud of dust raised by some of the competitors, and was about to pull into the right hand side of the road when he entered into collision with No. 35 Martin & Lethimonnier, driven by Henry Paul Martin, at a speed of over forty miles an hour. According to spectators, no blame could be attached to the competing car, which, although traveling fast, was as far to the right hand side of the road as possible. Those killed were Martin, the driver of the competing car, reported to be connected with the Sultan Motor Company, of Springfield, U. S. A., Faveau, who was by his side, and Villemain, sitting with his feet on the running board. Villemain was well known as a racing driver, first with Darracq, later with Bayard-Clement. For a long time he formed one of the team of which the late Albert Clement was the chief. In the non-competing car Roullier, the driver and two newspaper men met their death. On receiving instructions from the Government, the Automobile

NO STRAYING DOGS OR BOYS IN THIS VILLAGE.

Club of France ordered the tour to be stopped, and directed the cars which had accomplished the first two stages successfully to proceed to Trouville in readiness for the race on the guarded circuit.

This accident has caused a revulsion of feeling against touring competitions on unprotected roads, for, although precautions are taken to prevent speeding, it is impossible to keep inconsiderate drivers under control on such occasions. It has been shown, on the other hand, that speed contests on guarded roads are thoroughly safe, no serious accident having occurred during any of the races in France this year. The public is now more favorably inclined towards the Marquis de Dion's scheme for the construction of a natural autodrome in some mountainous part of Auvergne, where any speed or touring test could be held with little danger to competitors or spectators. His suggestions to that effect did not meet with a very enthusiastic reception from either the automobile club or the race-going public at the outset for many reasons, but the accident has been the means of causing an entirely different view of his proposals in those quarters.

ZÈLÈLÉ, THIRD, IN HIS FIRST SPEED EVENT.

### ANOTHER LONG ISLAND MOTORWAY.

From Highland Park, a suburb of Brooklyn, to Massapequa, L. I., runs a water conduit on land owned by the City of New York. At the last meeting of the Board of Aldermen, before its summer adjournment, a resolution was passed, favoring the building of an automobile speedway on the top of this water conduit, and the matter was referred to a committee of three, consisting of Controller Metz, Water Commissioner O'Brien and Nelson P. Lewis, an engineer of the Board of Estimate.

It is understood that the plan has been investigated and found entirely feasible, and Commissioner O'Brien and Engineer Lewis will so report to Controller Metz on his return from Europe.

The conduit parallels the Long Island Railroad and the well known Merrimac road, passing through various Long Island towns where speed ordinances have been strictly in force. It is asserted that by another summer the motorway will be an actuality. Alex. Schwalbach, of the Long Island Automobile Club, has been an energetic factor in the preliminary work on the proposed motorway, and is enthusiastically working for it.

## IMPORTERS' SALON SUGGESTS RULES FOR CONTESTS

THROUGH its Trades and Contests Committees, appointed in June last, the Importers' Automobile Salon has forwarded its report to the Association of Licensed Automobile Manufacturers, the American Motor Car Manufacturers' Association and the Automobile Club of America. While the report also goes to the Salon itself, it is taken for granted that since its committee contains the leading importers, it will be acceptable to the entire membership.

In submitting the report the Trades and Contests Committee states "that it desires to place the sport on a higher plane to the benefit of the interested public, and to the individual importer and dealer in automobiles, whose sole intention in entering their cars is to have them judged entirely upon their merits."

The committee assumes that the majority of past tours, runs, races and contests have not been based on the proper grounds or foundation to bring out the best results, stating:

"The reason of this is clearly that no organized automobile body whose experience is complete mechanically and otherwise has offered to assist or aid by suggestion or advice, or to stand sponsors for, the mechanical correctness and merit of the event in which members' cars compete. The entire responsibility of the officiating association or clubs being to-day limited to the mere question of whether the date conflicted with that of any other meet already sanctioned."

The committee believes that its recommendations will be "quickly recognized by other organizations and clubs as an opportunity for the co-operation of all interested parties to effect the elimination of the admittedly undesirable and eventually costly element in competition and to inaugurate a new basis of operating and conducting contests. In these contests, selecting the most approved methods and mechanically conceded formulas for awarding prizes, that every prize awarded may actually mean some particularly desirable feature proved by the winner, which the public, the manufacturer, clubs and associations can readily recognize. In fact, work out a real standard for determining perfection."

### Horsepower Suggested as Basis of Classification.

Probably the most noticeable fact about the recommendations urging a uniform basis of classification for cars in tours, races and hill climbs is to be found in a return to old and well-known standards of engine rating, the classic horsepower formula used in rating steam engines for almost a century past having been adopted with the necessary modification to make it apply to the gasoline engine. This is the addition of " $x^2$ " in the denominator, in order to compensate for the fact that the four-cycle engine does not generate an impulse per turn, per cylinder.

It will also be noticed that, pending the taking of general action by a national or international committee as suggested, it is recommended that cars be classified solely according to their horsepower, seven classes being provided, ranging from "under 10 horsepower" to "60 horsepower and over," and being based upon a table of horsepower prepared by Worby Beaumont, published in the *Automobile Club Journal*, London, and *THE AUTOMOBILE*, August 2, 1906.

### THE RECOMMENDATIONS OF THE COMMITTEE.

First—Your committee formally recommends the discouragement of events exclusively for either foreign cars or for American cars as not tending to bring out the comparative merits of the two, nor fair to either one or to the public, and recommends that such events be not supported by entries of any imported cars.

Second—That the judges, committees, or other officials directly in charge of all contests, and especially such committees as formulate the basis upon which such events shall be run, be selected from automobile or mechanical engineers whose standing is recognized by the industry and community, and whose knowledge and interest in the welfare and progress of the industry will be paramount. That such judges, committees or bodies in charge should include representatives of recognized repute from each and all of the prominent associations known to have the interest of the indus-

try at heart. These, in the mind of your committee, would be representatives of the Association of Licensed Automobile Manufacturers, the American Motor Car Manufacturers' Association, the Automobile Club of America and the Importers' Automobile Salon.

Third—That each of these associations appoint from their membership a Trades and Contests Committee, similar to our own; that a representative of each of these committees, conveying the opinions and ideas of their representative committees, jointly revise the merit of determining basis or standards which are in use to-day, and which are recognized as sometimes partial, discriminating and unreliable.

Fourth—Until such a desirable state of affairs can be brought about your committee recommends as the most fair, the most complete scientific and generally recognized foundation of all merit, the true horsepower classification, and that, pending further national or international action in the matter, the generally conceded fair average horsepower formula adopted by the Royal Automobile Club of Great Britain and Ireland for determining horsepower for contest purposes be accepted by the importers in classifying for the purpose of same, and further until the aforementioned and hoped for nationally and internationally "accepted basis" becomes a fact, the following classification be urged by importers for use in such contests and by such associations as will use them:

Class A, beginning with 60 h.p. and over.

Class B, beginning with 50 h.p. to, but not including 60 h.p.

Class C, beginning with 40 h.p. to, but not including 50 h.p.

Class D, beginning with 30 h.p. to, but not including 40 h.p.

Class E, beginning with 20 h.p. to, but not including 30 h.p.

Class F, beginning with 10 h.p. to, but not including 20 h.p.

Class G, under 10 h.p.

[Based upon a table of horsepower, prepared by Mr. Worby Beaumont, published in the "Automobile Club Journal," London, and "The Automobile," New York, August 2, 1906.]

### Committee Asks That Criticisms Be Made.

Accompanying the report is the following letter wherein the Trades and Contests Committee asks to have its plans criticised: Dear Sirs:—

The Importers' Automobile Salon, representing practically all of the importers doing business in this country at present, believes that the time has come when steps should be taken by those directly interested, manufacturers, clubs and associations, to preserve the high standing of the automobile industry in the eyes of the public, especially with reference to the sporting, touring and contesting branches of such industry.

Therefore, the Trades and Contests Committee of the Salon takes the liberty of handing you herewith a brief outline or suggestion showing one way in which at least a start may be made to that end, and which it is hoped will result in at least starting forth a co-operative movement between all interested organizations to advance the sport of automobilism along mechanically correct lines, which will prove as beneficial to the industry, as it surely will be satisfactory to the automobile-loving public.

The Committee would like very much to have this plan criticised or a new one advocated that will bring about the desired results, and is in hopes that similar committees will be able to devise means of arriving at some satisfactory basis for the betterment of the cause.

Very truly yours,

TRADES AND CONTESTS COMMITTEE,  
Percy Owen, Paul La Croix,  
Gaston Rheims, Geo. MacWilliams,  
C. R. Mabley, Secretary.

Considerable surprise has been expressed at the leaving out of the American Automobile Association, the present governing body, from the list of organizations supplied with the recommendations of the Importers' Committee. In view of the fact that the Racing Board of the A. A. A. has conducted the Vanderbilt Cup race for the past three years in a most thorough and satisfactory manner, and according to international conditions, and the Touring Board this year endeavored by every means in its power to consult the manufacturers and utilized a consensus of their opinion in formulating the rules for the annual Glidden tour, the ignoring of the governing body is considered by many as not only discourteous but detrimental to the results aimed at by the Importers. "Pulling the chestnuts out of the fire for other people," is the way one man, well known in the trade and sport, explained the puzzling situation.

# INTERPRETATION OF THE 1907 CONNECTICUT LAW

By E. F. HALLEN, COUNSEL FOR THE AUTOMOBILE CLUB OF BRIDGEPORT.

THE new automobile law recently passed by the general assembly and signed by the governor differs radically from the automobile law hitherto in force in this State. For this reason it is deemed wise and expedient to explain to the members of the Automobile Club of Bridgeport and to other interested persons the principal provisions of the new law, and to point out wherein it differs essentially from the law previously in force.

At the beginning of the legislative session considerable antagonism was manifested against further favorable automobile legislation, but a vigorous educational campaign, waged during the entire session, has been splendidly effective in bringing the legislature to a realizing sense of the need and importance of the automobile as a great factor in our growth and progress.

Under the new law additional burdens are placed on automobilists, notably in the increased cost of registration of machines, in the obligation to obtain an operator's license—this is a new feature—and in the cost of such license. These burdens are offset by the practical removal of the speed limit, and by the application of all registration and license fees, fines and penalties by the State for the maintenance and repair of improved roads.

## Speed Limit Removed.

Perhaps the most important feature of the new law is that the present arbitrary speed limit of twelve miles an hour within any city or borough and twenty miles an hour outside the limits of any city or borough has been removed. The rich and easy graft of many of the constables and of some other town officials should be a thing of the past. The new law provides that "no person shall operate a motor vehicle on the public highways of this State recklessly or at a rate of speed greater than is reasonable and proper, having regard to the width, traffic and use of the highway, or so as to endanger property or the life or limb of any person." This holds the driver in every instance to a strict measure of responsibility, and leaves decision as to the propriety of the operator's action entirely to the court with right of appeal in all cases.

It is provided, however, in the new law that a rate of speed of over twenty-five miles an hour for the distance of one-eighth of a mile shall be prima facie evidence of reckless driving, which means that when apprehended for operating at a rate of speed in excess of twenty-five miles an hour the burden is on the operator and not on the prosecutor to prove to the court or other tribunal that, considering all the circumstances of the case, he was not operating the car at a rate of speed greater than was reasonable and proper. If, on the other hand, one is apprehended when operating a car at a rate of speed less than twenty-five miles an hour, the burden is on the prosecutor instead of on the operator to prove that, considering all the circumstances of the case, the car was operated at a rate of speed greater than was reasonable and proper.

## The "Reasonable and Proper" Feature.

It is important, and should be borne in mind, whatever the rate of speed, whether two miles an hour or fifty miles an hour, if the driver is operating the car at a rate of speed that is reasonable and proper, considering all the circumstances in the case, that there is no violation of law; that no penalty of any kind should attach, and that there is a right to appeal in all cases.

It is earnestly hoped that all automobilists will assist in upholding the spirit of the new law, and that all unwarranted arrests made to satisfy the greed of some town officials, in a few isolated localities, will be met by prompt appeal to a higher tribunal, even if it means some personal inconvenience to the automobilist.

On the other hand, all cases of reckless driving should be frowned upon by your organization. The penalties under the new

law are very severe, and your club should lend its valuable aid to seeing that all reckless offenders get their desserts.

The operator who is a reckless dare-devil should receive no sympathy, since it is he who often brings a large and worthy class into undeserved disrepute. He can be squelched quickly and effectively under the stringent provisions of the new law.

## Operator's License.

A radical departure in the new law, and one which is intended to enforce careful driving, is the operator's or chauffeur's license. This license can be issued to no person under eighteen years of age, and must be obtained yearly from the Secretary of State at a cost of \$2 per year. Unlicensed persons may operate a car only when accompanied by a licensed driver, and then such driver will also be liable for any improper operation of the car.

The Secretary of State or deputy secretary may, after due hearing and subject to appeal, revoke any operator's license for any cause which he deems sufficient, and he must revoke it upon a third conviction within the same calendar year for any violation of the act. No revoked license can be renewed within three months, and then only in the discretion of the Secretary of State.

## Non-Residents.

A non-resident, if he has complied with the automobile laws in his own State, may operate his car in this State for a period of not over ten successive days at any one time without registering his car or taking out a license. A marker of his home State must be shown, but no machine can carry over two markers in front or two markers in rear at any one time.

## Registration.

The new law provides for the registration of automobiles on a very different scale. Under the old law the registration fee was \$1, and the same fee was charged for renewal. The new law makes the registration fee \$3 for registration of cars of less than 20 horsepower; \$5 for cars of 20 horsepower and less than 30 horsepower, and \$10 for cars of 30 horsepower and higher. The registration fee for a dealer covering all his cars is \$10, and the registration fee for a manufacturer is \$100. All renewals must be annual.

## Markers and Lights.

The Secretary of State will continue to issue markers for machines registered with him, and the provision is continued in the new law that the letters or figures shall not be less than four inches high and each stroke thereof not less than one-half inch wide. Markers must continue to be carried both front and rear, and in addition the rear lamp showing a red light from the rear and white light at the side must be so arranged as to illuminate the rear number. In the night season one or more white lights shall be displayed on the forward part of the machine.

Every owner who has complied with the old law and who shall register under the new law prior to September 1, 1907, may retain the same registration number and may use his old plates or markers having such registration number thereon.

The new law goes into effect August 26, 1907.

I am informed by the Secretary of State that he will send out in the very near future blanks and circular letters to every automobile owner registered under the old law, giving necessary information for registering machines and obtaining operator's license. He will also enclose in pamphlet form a copy of the new automobile law.

It is very important that these blanks should be properly filled out and promptly forwarded to the Secretary of State. If filed with the Secretary of State before September 1, 1907, the owner

can positively retain his old number and use his old markers. If filed later than September 1, 1907, it is a matter of choice with the Secretary of State, and if someone else secures his registration number there is no redress.

#### Principal Requirements Under Law.

The certificate of registration which will be furnished by the Secretary of State must be at all times carried upon the automobile, and shall be subject to examination upon demand by any proper officer.

Every automobile while being used or operated shall have displayed in a conspicuous manner, entirely unobscured and securely fastened, a plate or marker on both front or rear. The rear marker must be fastened so as not to swing.

The Secretary of State must furnish all plates or markers at cost price.

An operator's license must be obtained from the Secretary of State. This license will cost \$2 and will continue in force for one year from date of issue unless sooner suspended or revoked for cause.

The operator's license must at all times be carried by the licensee when he is operating an automobile and shall be subject to examination on demand by any proper officer.

The operator must stop his automobile immediately and must also stop his motor or engine immediately if horse or other draft animal shall appear to be frightened or any person in charge shall signal to stop. If traveling in opposite direction, automobile must remain stationary so long as may be reasonable to allow such horse or draft animal to pass; or if traveling in the same direction, the operator shall use reasonable caution in thereafter passing such horse or other draft animal.

No person shall operate an automobile when intoxicated or in a race or on a bet or wager.

Every automobile shall be provided with adequate brakes and with a suitable bell, horn or other signaling device.

During period one hour after sunset to one hour before sunrise must display one or more white lights on forward part of automobile, so placed as to be seen from the front at a distance of two hundred feet.

The rear light must illuminate the rear marker.

If arrested, may tender automobile as bail, and if of sufficient value must be accepted.

Fees under the new law are as follows:

Registering car less than 20 horsepower, \$3.

Registering car 20 horsepower, less than 30 horsepower, \$5.

Registering car 30 horsepower and higher, \$10.

Each dealer's certificate of registration, \$10.

Each manufacturer's certificate of registration, \$100.

For each operator's license, \$2.

The new law will soon go into effect, *viz.*, August 26, 1907, and it is important to comply with its provisions.

Some town officials, smarting under the loss of revenue occasioned by the passage of this law, may be on the alert to apprehend well meaning automobilists before they are acquainted with the provisions of the new law and before they are aware that the new law has gone into effect.

#### TEXAS AUTO LAW SOMEWHAT FAULTY.

FORT WORTH, TEX., Aug. 17.—Omission of the word "sundown" in the new State automobile law has caused considerable confusion in regard to lights on cars, as, according to the wording of the law, cars have to carry lights all day as well as night. The new State law requires, according to the wording of the certified copies, that lights on the front and rear of the car shall be lighted from "one hour after until one hour before sunrise," thus leaving only two hours in the day when it shall be legal for machines to go without lights.

Had the word "sundown" been placed in the law as evidently intended, it would have been in uniformity with laws in other

States and read "from one hour after sundown until one hour before sunrise."

Another fault which has been found with the law is that the license number which is required does not show whether it is a State license or what it is. In a number of cities a city number is also required, no specification being made except that the number shall be on both front and rear of the machine and be six inches in height. The State specifications are the same, so that it is impossible to tell which is the city and which the State number. A Fort Worth automobilist created considerable surprise when he started out with the machine numbered "5376." It developed later that he had put his city number "76" next to the State number "53," and as both were made of the same material it looked as though there were 5,376 autos in Fort Worth.

The new law makes 18 miles an hour the maximum speed limit in the country and leaves the city to make their own limit. So far there have been no arrests reported either for exceeding the speed limit or for running without a license number.

#### TIMELY EDITORIAL BY THE BROOKLYN EAGLE.

"For the automobilist who runs amuck anywhere and everywhere no extenuating word can be said—the sooner he is included among the vanishing types the better. However, this statement can be applied to others. The vanishing type should include the village authorities who are crusaders for revenue rather than regulation. They see things through a glass darkly. They see an immediate contribution in the shape of a fine, but they lose sight of the larger returns accruing when the automobilist is driven off by a species of petty blackmail. Quite a crop of little industries diversifies the path of the car, and it supplements resources accordingly. Also, the resources diminish accordingly when the village autocrat has less regard for the speed limit than he has for a chance to victimize invaders. Then there are justices, so called, who make annoyance and inconvenience preliminary to a maximum fine, deferring action that could be taken at once, and compelling attendance, which is more of a response to caprice than to any of the real necessities of the case. This sort of thing may not be as reprehensible as the chauffeur who runs amuck, but it is altogether indefensible and gratuitous. Wherever it is done—or attempted—the right man is not in the right place. One nuisance is a poor substitute for another, to say nothing of other considerations. Automobilists usually have money and few of them try to drive sharp bargains. It is poor policy to repel them by petty plundering and otherwise."

#### TESTIMONIAL DINNER TO TOM MOORE.

Though he signs himself T. Francis Moore, everybody calls him "Tom" Moore, and his resignation as publicity manager from the staff of Wyckoff, Church & Partridge, the well-known New York City agents of the Stearns, was recognized by a farewell dinner at the Cafe des Beaux Arts, Sixth avenue and Fortieth street, Tuesday evening last. Two scores of well-known figures in the automobile world, including A. W. Church and E. S. Partridge, did honor to the guest of the evening, who received a gold watch and fob as a combination testimonial from the company and his friends present. Of course, there were speeches and also all sorts of things said about the guest of the evening, who has plans of a national character for the near future.

Those present included Duncan Curry, J. H. Gerrie, E. E. Schwarzkopf, L. D. Rockwell, H. T. Clinton, R. G. Kelsey, J. E. Demar, A. N. Jervis, F. E. Spooner, L. R. Smith, W. I. Fickling, W. W. Burke, Harry Burchell, W. H. Horner, James J. Joyce, R. B. Johnston, R. H. Johnston, Fred J. Wagner, Charles J. Dieges, R. W. Howell, N. Lazarnick and Peter Fogarty.

Nothing has proved more deceptive, where registration figures are concerned, than the working of the New Jersey law, and the same thing is naturally true of the laws of a similar tenor enforced in Pennsylvania. New Jersey probably has 10,000 resident autoists, but the registration figures credit it with 30,000.

# KNOCKING IN MOTORS: ITS CAUSE AND EFFECT

FROM THE RAMBLER MAGAZINE.

**F**EW are the drivers of an automobile who have not at some time had experience with what is commonly termed knocking or pounding in the motor. While this is a common occurrence, comparatively few are aware what actually takes place, its cause or probable effect.

When an engine runs irregularly from over-load it is said to labor, and when this condition increases a sharp, metallic sound is heard, like pounding on metal. This is termed the knock. The lesser the number of cylinders, the more liable is this knocking to occur and the more readily will it be felt in the running of the car.

As is well known, the torque or twisting strain on the crankshaft of an internal-combustion motor varies with the several cycles of action.

In the single-cylinder engine we may take first the suction stroke, during which, if the motor is properly constructed in valve dimensions, etc., there should be no load or resistance to the momentum stored in the flywheel. On the succeeding compression stroke there is a rapidly increasing resistance as the compression rises within the cylinder; hence, as the crank passes the center at the end of the suction stroke, the flywheel speed will be reduced to its lowest point.

Immediately following ignition occurs, and when the power stroke begins there is a tendency toward a rapid increase in speed in the flywheel. At the end of the power stroke the exhaust valves are opened, and here again, if the valves are of proper dimension and the muffler does not exert back-pressure, there should be practically no resistance to the momentum of the flywheel.

It will thus be readily seen that the purpose of the flywheel is to regulate speed in rotation of the crankshaft, and to smooth out and overcome the tendency toward varying speeds, and the effective action of the flywheel will be entirely dependent upon its weight and dimensions.

Taking a flywheel of proper design for the engine on which it is used, the variation in speed of rotation should be reduced to a point practically indiscernible. However, under certain adverse conditions the flywheel fails to be adequate and the variation in speed will be readily noticeable.

## Premature Ignition a First Cause of Trouble.

One of the first causes for this extreme variation is premature ignition. When this occurs, either through overheating of the engine or too great an advance in the spark, the early ignition causes a quick rise in pressure before the crank passes the center, and the tendency is, therefore, to drive the crank and flywheel backwardly. In fact, as the motor is slowed down by overload, it will very often occur that the flywheel will stop its forward action entirely and run backwardly. This often occurs when a motor is stopped, after continuous running and in heated condition, by cutting off the spark but not entirely closing the throttle. Under this condition the motor's speed slackens until finally the momentum of the flywheel becomes so slight that when ignition occurs prematurely, through heat of the cylinder or a red-hot carbon deposit, the pressure thus prematurely exerted overcomes this momentum and the flywheel will run backwards, sometimes several revolutions.

The most prevalent cause of knocking is improper use of the spark.

Inexperienced operators, and many whose experience is sufficient that it should teach them better, leave the spark advanced when running their car under adverse conditions, such as climbing steep grades or negotiating heavy roads.

The idea in advancing the time of ignition is to so effect firing of the compressed charge that it will be entirely ignited, and the pressure thus rises to its highest point at the instant the crank

crosses the center line. This requires a measurable length of time, which is not dependent on the speed of the motor. Therefore, if the motor be traveling at, say, one thousand revolutions per minute, and the spark is advanced sufficiently far that ignition becomes complete on crossing the center, it will readily be seen that if the spark occurs at the same point in relation to the crank travel with the motor running at, say, five hundred revolutions per minute, the pressure will rise to its maximum point before the crank crosses the center, and will thus be exerted in a backward direction. Consequently, when, through excessive load, the motor speed is reduced without the spark being at the same time proportionately retarded, this condition of preignition is bound to occur. The result is not only the consequent reduction of power, but exerts strains on the motor and the entire mechanism many times in excess of the normal stress of regular service.

## Excessive Strain an Effect of Premature Ignition.

The knock before mentioned does not occur until the laboring becomes excessive, and its cause may be readily explained by taking the example of suspending a piece of metal of considerable weight in the air. Thus suspended, strike this a quick blow with a heavy hammer. The metal will swing away from the impact with little or no visible effect. Then take the same piece of metal, securing it against movement, and strike the same blow. The effect will be immediately noticeable, and may result, and probably will, if not the first time, upon repetition of these blows, in bending or breakage.

When the motor is running at reasonable speed and ignition occurs at the proper time, the effect of the sudden rise in pressure on the piston-head is practically the same as that of the blow of the hammer on the suspended weight, and the flywheel traveling with considerable momentum, the pressure is allowed to exert itself gradually on the outwardly moving piston and the wear and strain on the motor is comparatively slight.

Now if, on the other hand, the explosion occurs with the crank practically stationary on the dead center or, as is still worse, with the piston traveling upwardly on the compression stroke, the effect is the same as when the hammer blow was delivered to the immovable mass of metal. The resultant condition is somewhat like the statement of the Yankee who, when asked the old-time question of "What would occur should an irresistible force strike an absolutely immovable mass," scratched his head for a moment and remarked that he did not have time to figure it out, but he reckoned there would be splinters somewhere. If splinters do not occur immediately in the form of a broken crankshaft or bent or broken connecting rod, the damage is bound to exist, though possibly not immediately visible.

## Fatigue of Metals Under Violent Stresses.

There is a prevailing expression that metals become fatigued, and it is under such sudden, violent stresses as this that metal-fatigue is caused, and, like the tired man, the fatigue eventually reaches the point of breakdown.

Another disastrous effect lies in the great increase of temperature under these conditions. Temperature of a burning gasoline vapor, at the pressure usually existing in well-constructed motors, runs to 3,000 degrees Fahrenheit and upward. The melting point of the metals of which the cylinders and pistons are constructed is below this point, and if this temperature is maintained for any length of time warping of the metal parts exposed is bound to occur. Metal exposed to heat may warp temporarily, and if cooled gradually may return to its original condition; but if, while thus heated, pressure is exerted upon it the molecules of the metal are liable to set in this warped condition and the deflection becomes permanent. This results in loss of compression

and probably in ruining the cylinders or pistons. A common occurrence when the motor is run for any length of time in this condition is the cracking or blowing in of the face of the piston. However, the most immediate destruction occurs in the bearings both of the main shaft and connecting rods, as when the blow of the explosion occurs the tendency is to drive the piston outwardly, and the above-mentioned bearings act as an anvil and receive nearly all the force of this blow. The connecting-rod bearings naturally receive the greater portion of it, as the weight of piston and connecting rods is comparatively light, while the crankshaft is of sufficient weight that it resists the blow with comparatively little movement, and the connecting-rod bearings are caught between the two opposing forces.

#### How the Other Working Parts of the Car Are Affected.

Going beyond the motor; as long as the car and motor are running smoothly the stress upon the gears, shafts, chains and differential is very nearly constant, and energy is being furnished by the motor, at a practically uniform rate, just sufficient to overcome the natural load—that is, the frictional resistance in the mechanism and the inertia of the car.

When, however, the engine begins to labor and approaches the stalling point the strains acting upon all parts of the car are intermittent and the loads thrown upon the parts vary greatly, from severe driving strains at the height of the power stroke to slight driving force, or perhaps zero or nearly negative loads, at the end of the compression strokes. While, of course, the parts of the car thus affected are, beyond the motor, not subjected to heat, such strains are still of the fatiguing nature and in course of time result in crystallization or breakdown.

As the primary cause of all this is overload, the first relief therefrom lies naturally in the reduction of the gear.

There is a common tendency among motorists to avoid shifting gears from a higher to a lower setting, and they will, therefore, compel their engine to labor and overheat on grades where they should have long before dropped back to a lower gear.

It is by no means uncommon to see motorists coaxing their car over a grade on the high gear, when, by reducing to the intermediate or even in case of a two-speed transmission to the low, the motor could, by this lightened load, speed up and take the car at a much higher speed than under the labored conditions incident to the high gear. Thus, to gratify a misguided desire to "take the hill on the high," the driver subjects his car not only to excessive but wrecking strains, and at a loss rather than a gain of speed, and often discomfort to his passengers owing to the jerky motion of the car. The careful and experienced operator will take every reasonable precaution to avoid overloading of his motor, and will be amply repaid for his precaution in the long life and smooth running of his car and all its appurtenances.

#### WHAT THE AUTOMOBILE MEANS TO FRANCE.

It is not to be denied, says *L'Economiste europeen*, that automobiling, which at its debut was purely a Parisian sport, is now becoming the national means of transport. The proof is furnished by the statistics of the direct fiscal contributions of the 26,262 automobiles in use in France in 1906, of which the city of Paris only accounted for 5,058, while French cities of less than 5,000 inhabitants possessed a total of 9,710 machines, that is, 91 per cent. more than Paris. Nor must it be lost to sight, what they bring into the treasury in the form of both direct and indirect taxes. Where the first-named are concerned, the progression since 1899 is as follows: 1899, 90,830 francs; 1900, 156,497 francs; 1901, 381,105 francs; 1902, 635,772 francs; 1903, 934,604 francs; 1904, 1,311,187 francs; 1905, 1,763,792 francs; 1906, 2,263,651 francs. These figures do not include those municipal taxes, such as those of Paris, for example, that are equivalent to the impost levied by the State itself. So far as taxes that automobiling pays indirectly are concerned, such as in duties on gasoline, lubricating oils, grease and the like, it is not too much to say that these are valued at fully five times as much as the direct contributions.

## THE AUTOMOBILE CALENDAR. AMERICAN.

### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Oct. 31-Nov. 7...—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, Secretary, 184 La Salle Street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4...—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.

### Races, Hill-Climbs, Etc.

- Sept. 2.....—Wildwood, N. J., Straightaway Race Meet, Motor Club of Wildwood.
- Sept. 2.....—Chicago, Harlem Track, Race Meet under the auspices of the Chicago Automobile Club.
- Sept. 2.....—Bridgeport, Conn., Labor Day Hill Climb, Sport Hill, Bridgeport Automobile Club.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.
- Sept. 7.....—Philadelphia, Point Breeze Track, Quaker City Motor Club.
- Sept. 7.....—Minneapolis, Minn., State Fair Race Meet of the Minnesota State Automobile Association.
- Sept. 9-10.....—Pittsburg, Pa., Brunot's Island Track, Race Meet, Automobile Club of Pittsburg.
- Sept. 14.....—Jamestown (Va.) Exposition, Aeroplane Contest for "Scientific American" Prize.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Sept. 20.....—Milwaukee, Wis., State Fair Grounds Track, Race Meet, Milwaukee Automobile Club and Milwaukee Dealers' Association.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### Motor Boat Races.

- Aug. 22.....—New York to Jamestown (Va.), Annual Cruise, American Power Boat Association.
- Sept. 2-6.....—Jamestown (Va.) Exposition Motor Boat Races.

## FOREIGN.

### Shows.

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7.—Denmark, Copenhagen International Automobile Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Jan. 18-Feb. 2...—Turin, Italy, Fifth International Automobile Exposition. Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

### Races, Hill-Climbs, Etc.

- Aug. 23.....—Belgium, Ostend Motor Boat Meeting.
- Aug. 11-29.....—France, Coupe de Auvergne.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.
- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chateau-Thierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gailion Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- May 16, 1908...—Sicily, Targa Florio, Automobile Club of Italy.
- July 14, 1908...—Paris to London, Aerial Race.

# INFLUENCE OF ALTITUDE ON MOTOR POWER\*

It is a matter of common knowledge that as the atmospheric pressure decreases, and in consequence the mass of the volumetric unit of air diminishes, the power of an internal combustion motor for a given piston speed also falls off. It is interesting to observe in what ratio this takes place with increasing altitudes. The problem is particularly interesting to those who are devoting attention to the subject of aviation, whether as advocates of the dirigible balloon, or the aeroplane, even though the latter rarely get above the level of the earth.

Several authors have estimated that the power of a motor should be proportional to the mass of the mixture aspired in a certain unit of time, assuming a constant angular velocity, and to render it proportional to the density of the air, it may be joined with the altitude in the following equation:

$$\frac{D}{D_0} = \frac{1}{e^{DA}}$$

In which D corresponds to the altitude A;  $D_0$  is a degree of density corresponding to the altitude 0, and  $e$  the base of the

APPARATUS AS ARRANGED FOR CARRYING OUT EXPERIMENTS.

Naperien logarithim. The result is then:

$$\frac{P}{P_0} = \frac{1}{e^{DA}}$$

or:

$$\log \frac{P}{P_0} = -\log e^{DA} = 0.0005435A$$

which demonstrates that the altitude increasing in an arithmetical progression, the power will decrease in a geometrical progression,

so that at 1,000 meters the result would be  $\frac{P}{P_0} = 0.88$ .

Unfortunately, this theory is inexact, because it does not take into account the diminution in compression which will cause a rapid falling off in the output of the motor. On the other hand, the depression produces an enrichment of the mixture, which is not a negligible factor, as at 1,000 meters ( $p = 670$  mm. approximately), and there will be necessary an additional volume of air of about 0.08. This enrichment of the mixture partially compensates for the loss in compression.

The variations in the amount of power produced have been ascertained experimentally by reproducing artificially different variations in pressure to correspond to various altitudes, and the following results have been obtained with a four-cylinder, four-cycle motor, the bore and stroke of which measure 100 by

120 mm., respectively, with a pressure of 760 mm. and an output of 33 horsepower at 1,350 r. p. m.

Altitude in Meters.	Pressure.	$\frac{P}{P_0}$	Effective Horsepower.
—	—	—	—
0	760	1,00	33
1,000	670	0,84	28
2,000	590	0,72	24
3,000	522	0,60	20
4,000	462	0,50	16,5
		$\frac{P}{P_0}$	$P$

The apparatus employed in the conduct of the experiments was very simple and its arrangement is illustrated by the accompanying line sketch. The motor was direct-connected to an electric brake, and the charge was modified in order to always a constant angular velocity of 1,350 r. p. m. The automatic carbureter was adjusted so as to permit the motor to develop its full rated output of 33 horsepower at the above speed, at atmospheric pressure, and was not touched throughout the course of the experiments. Its air supply was taken through a tank of relatively large dimensions (120 liters) and provided with a cock to permit the operator to vary the pressure in its interior at will, the latter being recorded on a mercurial manometer mounted on the end of a spiral tube communicating with the tank.

As a beginning the air cock is opened, and after regulating the rheostat their pressure and the power may be read directly and easily converted into terms of altitude and effective output. We have neglected the error of excess back pressure due to the fact that the exhaust is at atmospheric pressure regardless of the variations at the intake side of the motor, as that pressure is, to put it in another way, of a secondary order, and experience shows that it is counteracted by that of the muffler. Naturally it is not possible with the aid of such crude apparatus to also study the effect of the low temperature reigning at such high altitudes on the homogeneity of the mixture. But in practice this great cold would simply necessitate a correspondingly great preheating of the carbureter. In short, the drop in the power follows rapidly that of the density of the mixture, as our reasoning has indicated *a priori*. On the other hand, the speed of a dirigible balloon should not be diminished overmuch on that account, as the resistance of the air diminishes with its density. In any case at the altitude assumed, i. e., 1,000 meters, the actual output of the motor is very slightly less than that calculated at a normal atmospheric density, and the speed of a balloon should not be appreciably affected.

While the question of decreasing power with increasing altitude naturally comes to the front most prominently in connection with the problem of aviation, particularly as concerned with the dirigible balloon at the moment, owing to the heights the latter may easily reach, it must be borne in mind that there are also numerous places on *terra firma* where automobiles are used that may present very similar conditions. For instance, much of the western part of the United States represents an altitude of several thousand feet above sea-level, and the same is true of almost the entire habitable portion of the great plateau of Mexico, which is of an average height of considerably more than 1,000 meters above the sea. Then there the heights of India and other eastern countries where the automobile is very rapidly being introduced, so that it may readily be appreciated that the question of a loss of power as the air becomes rarer is one of considerable importance to autoists in such situations. Now that the subject has been taken up as a proper matter for scientific research, doubtless further investigations will be made, with interesting results.

\*Translation from *La Technique Automobile*, Paris, by Charles B. Hayward.

## LETTERS INTERESTING AND INSTRUCTIVE

### CAUSE OF A MYSTERIOUS LOSS OF POWER.

Editor THE AUTOMOBILE:

[863.]—We are puzzled over the running of a little Oldsmobile curve-dash runabout of the 1906 type, which we have used about 5,000 miles. The machine was never damaged, and has given satisfaction until about three weeks ago, when it lost speed, and whereas it formerly ran about 25 miles an hour on the level, it now does not get above 15, and the throttle seems to have no effect after it is depressed past one-third of its travel.

The machine has had plenty of the best oil, the coil adjusted to every position, also the carbureter. Batteries have been renewed time and again and tested, both as a whole and separately. The machine also has recently been rewired, new secondary cable being used, fearing that this might have something to do with it. The valves have been newly ground into a nice gray bearing, and the piston rings do not leak compression. The engine is not tight in any of its parts, and turns over easily by hand, except with compression on, when it cannot be turned over without danger of breaking the starting chain, showing that the compression is normal. All kinds of spark plugs have been tried, but with no effect.

The inlet valve closes about five inches on the rim of the flywheel too late, according to the instructions of the manufacturer, but opens about right. The exhaust valve both opens and closes on time. The axles are in perfect alignment and well oiled, and the differential is in good condition and well oiled. Please give us something new to try, as this has puzzled us more than anything we have tackled in our five years' experience on all kinds of cars.

Winchester, Va.

J. FRANK EDDY & BROTHER.

Your troubles with the little Oldsmobile strike a responsive chord, as the writer put in the better part of a summer trying to solve a similar case last year. As you say the compression is normal, it is evident that the apparent late closing of the inlet valve has no bad effect, and you will find that the makers are very frank in their instruction book, stating that no pretensions are made to accuracy in the valve adjustment and that a few inches one way or the other was of no particular moment. Moreover, the distance of five inches on the flywheel periphery when translated into movement at the valve is practically a negligible factor in this case. The difference may probably be traced to the cam which has worn one-sided, thus giving the proper opening, but late closing. However, it is evident that the valve must be closing at about the right time, as otherwise the compression would be very poor, its failure to close allowing the escape of a considerable portion of the mixture. Judging both from the experience above referred to and that of others which has been of almost an identical nature, we feel pretty certain that you will be able to trace the trouble to the carbureter, but whether you will be able to remedy it without replacing the carbureter altogether is another matter. The difficulty appears to lie in the working of the auxiliary air inlet, and its failure to open as the speed of the motor increases accounts for that most exasperating of annoyances, the failure of the engine to pick up as the throttle is opened. Note the position of the auxiliary valve and its spring, the tension of which is controlled by a vertical screw protruding through the cover of the mixing chamber. Then take them down and see if dirt or other foreign matter has entered to prevent the movement of the diaphragm, or if the spring has become dead, allowing the valve to stick in one position. The effect is to cause the mixture to become entirely too rich when the throttle is opened, so that after a certain point the latter either has no effect or actually causes the engine to slow down. Several experts "sat" on the case we refer to on numerous occasions and each time it would look as if the trouble had been cured, but it never stayed cured for more than a day or so at a time. In all probability the replacement of the inlet cam on your machine and attention to the carbureter as above outlined will be found sufficient to cure it. At least it will give you what you ask for, *i. e.*, a new line upon which to branch out and which should probably result in your effecting a complete cure of the ailment without any further extended sessions of tinkering such as you refer to.

### TWO-CYCLE MOTOR DIMENSIONS WANTED.

Editor THE AUTOMOBILE:

[864.]—Being a constant reader of "The Automobile," and valuing the Letters Interesting and Instructive as I do, I would like to ask a few questions on my own account.

In a two-cycle engine of the three-port type, the cylinder dimensions being 5 by 5 inches, what should the dimensions of the ports be; what should the compression space be, and what length of connecting rod and piston should be used?

C. A. BROWN.

Reading, Mich.

Make the compression space thirty per cent. of the stroke, which in this case would be 1 1-2 inches. If a higher compression be desired, this may be shaded somewhat, though it is unusual to make it less than twenty-five per cent. Have the exhaust port open one inch from the end of the stroke or lower dead center of the crank and the inlet port 11-16 from the end of the stroke. This gives a drop of 5-16 inch between the two and it is none too much; in fact, it might be increased slightly to advantage, as it is pretty near the minimum. The ports themselves should not be less than 3-4 and 3 1-4 inches long, respectively, though it is not unusual to find engines of this type in which the ports are made to extend almost around the circumference of the cylinder. The bottom of the ports should coincide with the top of the piston when the latter is at the lower end of its stroke. The piston can be made six inches long, though it is permissible to make it as long as possible consistent with the remainder of the design, *i. e.*, that of interference with the connecting rod, as a long piston gives a better bearing in the cylinder. In automobile motor design the length of the connecting rod is usually based on that of the stroke and varies with different makers, though 1.8 to 2 is a usual proportion. This would give nine inches in the former and ten inches in the latter case.

### SOME COMMON REASONS FOR DEAD BATTERIES.

Editor THE AUTOMOBILE:

[865.]—Won't you kindly tell us something about volt and ammeters, particularly to pocket kind usually used by autoists, with the most implicit faith as to their accuracy and reliability, in telling how much available capacity remains in an ordinary dry cell?

First, as to voltmeters. I have a distinct impression that as measures of voltage (pressure) they can be absolutely accurate, and that when contact is made with a dry cell, owing to the resistance in the meter, no appreciable damage is done to the dry cell, even if contact is held for an abnormally long time. Am I correct in this impression?

Second, as to amperemeters. Isn't the prevailing idea that such meters accurately measure the amount of available current still procurable from any dry cell very far from the truth? Isn't it a fact that the amperemeter simply measures the amount of flow as being such as would give, say, fifteen amperes for one hour or one ampere for fifteen hours without in any way indicating how long such flow will continue?

Isn't it also true that the ammeter short-circuits the battery with so slight a resistance that it damages the battery very rapidly if kept in contact?

If this latter is true, isn't it good practice to buy fresh dry cells of a good make and put them in service without testing them with the ammeter and, as soon as they begin to show weakness, throw them away and replace with new, and never to use an ammeter excepting if caught on the road with a lot of old cells to differentiate between those that will still give off some current and those that are totally dead?

Should some manufacturer of dry cells put one on the market with the terminals sealed, so that it could not be wired up or tested without breaking the seals, he would find me a customer, as I certainly would not buy a bottle of whisky that did not have a cork in it, and when buying dry cells what I fear most is not that they will be old, but they will have been damaged by repeated tests by ammeters in the hands of people who believe that the most valuable thing in a cell is its ability to show large amperage on a pocket meter, or that the cells may have been damaged by being carelessly short-circuited.

For instance, about a month ago I saw quite a large stock of dry

cells stored on a shelf waiting to be sold, and on top of them a lot of wire electric light cages. One can imagine the possible condition of such cells.

And again, last week I saw a machinist take off his jumper, which was very damp, if not actually wet with perspiration, and throw it on top of a lot of dry cells. His day's work was done, but the jumper and dry cells probably worked all night.

Such information as you give us in reply to the above will, I believe, be valuable to others as well as to  
New York City.

"GASOLENE SAL."

1. Your impression with regard to the voltmeter is correct. The coil in such an instrument is wound to a comparatively high resistance, and the potential of the dry cell being very low, it is unable to force more than an infinitesimal amount of current through the meter and thus connection with the latter will seldom do any harm, even though continued for some time. It is on this account that the makers recommend that nothing but a voltmeter be used in testing storage cells.

2. The popular impression that an ammeter records the amount of current still available in a dry cell at the time of testing is altogether erroneous. As you state, the reading is merely that of the momentary flow of current and is no indication whatever of how long the cell will continue to produce that amount of current. The use of the ammeter is very detrimental to the dry cell and dangerous with an accumulator, as the coil of the instrument has a very low resistance owing to the fact that it is necessary that the entire current output to be measured should pass through it. Hence, it is equivalent to short-circuiting the cells by dropping a screwdriver across the terminals or in some similar fashion, seldom intended, to hold the ammeter on them. As is to be implied from your further statement, it is very probable that the average user damages the cells far more in testing them than does the service to which they are subjected, and this is particularly true of the salesmen in the supply store. It is good practice never to use an ammeter unless there is some doubt as to whether the cells are really dead or not, and there is no other means, such as a voltmeter, to test them with. Of course, a voltage reading is not as accurate an indication of the state of a dry cell as a current test, but it suffices to show whether the cell is active or not. The instances of the treatment you speak of are nothing out of the ordinary and doubtless serve to account for more or less of the dissatisfaction arising from the use of dry cells, while your suggestion as to sealing the terminals at the factory and selling the cells in that condition is a valuable one that might be adopted with profit to themselves and the users by the makers.

### LIGHT ON THE CHARACTERISTICS OF ACETONE.

Editor THE AUTOMOBILE:

[883.]—I have been curious to find out ever since the adoption of the small portable, acetylene gas tanks for auto lighting just how the latter were made to hold sufficient gas within such a very small compass, as I notice they seem to have enough to burn quite a long time. Recently I was informed that the acetylene gas is combined with acetone in the tank, the latter material acting as a solvent, and permitting the tank to hold many times the quantity of gas it would have the capacity for without this addition. It certainly appears to be a very anomalous state of affairs to be able to put five or six times as much of a substance in a given space by the addition of another substance which also occupies space itself. Ordinarily, if it is desired to fill a cylinder with a capacity of two cubic feet, for instance, with oxygen or any other gas, the only way to make it hold more than two cubic feet is to compress it. But if a given quantity of some other gas be put into the same tank it will no longer be possible to put as much oxygen in it as formerly.

Then, what is acetone? This is the question I have asked on several occasions since learning of its use in these small tanks, but have never been able to learn anything satisfactory or definite concerning it. I ask the question merely out of a desire to have the knowledge, but have no doubt there are many others in my situation who would be interested to learn something about it.

Denver, Col.

CURIOUS.

Acetone, also known as pyroacetic spirit, is produced by the dry distillation of acetate of lime—a product made from lime

acted upon by pyroligneous acid. Its symbol is  $(CH_3)_2CO$ , and it is composed of three parts carbon, six of hydrogen and one of oxygen. It is also obtained by the destructive distillation of citric acid, starch, sugar, or gum, with quicklime. It is a volatile liquid with a specific gravity of 0.8 boils at 133 F, and has the peculiar property of acting as an absorbent of acetylene gas under pressure to the extent of several times its own volume.

### WHAT EFFECT HAS ALTITUDE ON HORSEPOWER?

Editor THE AUTOMOBILE:

[867.]—This city and its environs, as well as the greater part of what is known as the great plateau of Mexico, are situated at an altitude ranging from 8,000 to 10,000 feet above the sea level. Recently I have had a discussion with a friend here regarding the effect this would have on the internal combustion motor used in gasoline automobiles, as the latter are dependent for their functioning upon the atmospheric pressure. Theoretically, such an engine built at sea level and adjusted to run under the atmospheric conditions prevailing at such a level should require a great deal more air in order to develop the same amount of power when brought to this altitude owing to the greater rarity of the atmosphere. This is my contention. I do not know of any automobiles that are manufactured in places having a high altitude and do not see how the makers could adjust their engines to run under such conditions with knowing the nature of the latter. My friend is of the opinion that all this theory business is what you Americans call "rot"—scientific rot, he calls it—and says that no difference is necessary here for running an automobile engine at its full power as compared with any place in the United States. I am quite certain that unless special adjustments be made to compensate for the relative difference in atmospheric density, an automobile engine brought here directly from a low situation and adjusted to run in the latter will not develop its full power. Am I not right? Your opinion in the matter will doubtless enable me to show my automobile-wise friend that he does not know it all.  
Mexico City, Mex.

EMILIO GONZALEZ.

Your inquiry is very opportune, as although it has been well known that altitude has a very appreciable effect on the horsepower of an internal combustion motor, there has been no definite data to hand previously. However, in the present issue, you will find a résumé of the experiments made along this line by a French investigator, who produced pressures corresponding to various altitudes from 1,000 to 4,000 meters, artificially. Of course, the apparatus employed was admittedly crude, and probably the results attained are not as accurate as they might be made when subjected to closer investigation, taking into account every possible factor that could have any bearing on the outcome. But they show, nevertheless, that altitude has a great effect on the horsepower of a motor, the decrease being practically fifty per cent. at an elevation of 4,000 meters.

### EFFECT OF MIXING ALCOHOL AND GASOLINE.

Editor THE AUTOMOBILE:

[868.]—Kindly tell me through your columns the effect of mixing alcohol and gasoline, its proportions, effects, desirability and dangers, if any.

SUBSCRIBER A. E.

New York City.

Practically speaking, alcohol and gasoline will not mix. That is, one cannot be dumped into the other and a mixture of both result. It has been found by experiment that a mixture of 50 to 60 per cent. of alcohol to gasoline may be made, but six to eight days are required to combine the two liquids, this also involving a process not possible outside of a laboratory. As to its effect as a motor fuel we have no data. There is no danger involved.

### FINDS THE MAKER'S ADJUSTMENTS CORRECT.

Editor THE AUTOMOBILE:

[869.]—In the issue of August 8 of "The Automobile" I note your answer to my question, No. 850, and beg to state that I have received satisfactory results from lowering the level of the gasoline and enlarging the size of the jet, as originally arranged by the manufacturer of the car. As to my experience in repair shops, I might say that the manufacturer really adjusts the carburetor to the engine to give the best results. Kindly publish this in answer to my inquiry No. 850, as it may be of benefit to others.

Greenwich, Conn.

JOHN McWILLIAMS.

FRANKLIN MODEL D, FOUR-CYLINDER TOURING CAR.

WHILE the Franklin models for 1908 probably embody more distinctive new features than have come to light on any of the new models thus far uncovered, their makers, the H. H. Franklin Manufacturing Company, Syracuse, N. Y., lay particular stress in their announcement on the fact that the new Franklin has more power. Through refinement, perfection in construction and a slight increase in size, the motor formerly rated at 20 horsepower has been constructed to give an actual output of 28 horsepower on the brake, and of the factors leading up to this result the increase in size has doubtless had the least influence. While still retaining the basic principles that have always distinguished the Franklin motor, its designers, through a process of evolution, have succeeded in bringing out something entirely new, and something that is, moreover, in direct accord with engineering principles calculated to produce the very highest efficiency in an internal combustion motor.

In place of the former cylinder construction, a dome-shaped head has been substituted, this semi-spherical form being considered ideal for the internal combustion engine, for the reason that a sphere exposes the least surface for any particular volume—in other words, a minimum amount of surface for a maximum volume—and thus there is less of the interior of the cylinder exposed to the direct heat of the exploded charge, and the efficiency of the engine is increased. A further advantage is obtained in that the fresh charge may be introduced directly into the cylinder, and thus be kept at a much lower temperature than is otherwise the case. To accomplish this, the intake and exhaust valves have been constructed with a common center and are made concentric, thus permitting of the utilization of a greater valve area, and making possible the induction and expulsion of larger quantities of gas than through the former type of separately constructed valves, which limited their size to one-half that which can be secured by this new method of construction. The horsepower was consequently restricted, as the limitations of the valves made it impossible to secure the highest degree of efficiency available from a given size of cylinder, while this construction tends to bring about this long-sought result. It

also adds to the cooling ability of the motor by insulating the exhaust valve from the cylinder, the burnt gases being discharged through the central valve, while the fresh charge is inspired through the large intake valve surrounding the exhaust.

The method of valve operation employed on the 1907 models has, however, been retained, the rods being actuated through the medium of a set of hyperbolic-shaped cams on the single camshaft. The design is such that the movement of the valve lifter has been reduced to a minimum and with the aid of the perfected shape of the cam this otherwise more or less noisy part of the motor has been effectually silenced. Nor has any change whatever been made in the design or construction of the auxiliary exhaust system, which has long been a distinctive characteristic of the Franklin, though, as a result of extensive experimenting with the aid of a Schulze manograph, it has been found that the back pressure upon the piston has been reduced to a maximum of two pounds through the use of the auxiliary exhaust. The Franklin designers were always confident that this reduction was a substantial one, but it was not until the establishment of the laboratory at the Franklin plant that they were able to verify it, or state the amount definitely.

Another new feature of the Franklin motor, the origin of which, however, dates back to several months ago, is the use of oil baffles over the open end of each cylinder, and through which the connecting rod operates in a transverse slot. This compels the splashing of the lubricant in the crankcase exactly where it is most needed—the working side of the piston—and likewise prevents its being thrown about indiscriminately on the working parts, thus giving more uniform and efficient lubrication with the same quantity of oil as formerly employed. In planning the motors of the 1908 models, considerable experimenting was carried out in order to ascertain the heat-conducting value of various different metals, with the result that phosphor bronze of a high elastic limit is found to be very much superior to other metals or alloys for this purpose. In consequence, it has been decided to cast the cylinders of the 28-horsepower Type D, plain, and equip them subsequently with flanges

FRONT VIEW OF MOTOR SHOWING GEARS.

REAR AXLE UNIT OF FRANKLIN MODEL D.

made of this material, shrunk on by a process which causes them to bind tighter as the cylinder becomes heated, thus increasing their radiating capacity. The cylinders are not uniformly equipped in this respect, but the number of flanges is varied according to the position of the cylinder as regards the cooling fan. In accordance with this plan, the cylinder receiving the smallest volume of cooling air from the fan is provided with largest number of flanges, the placing of the latter being so calculated that the temperature of each cylinder will remain uniform under load. The cooling fans, both front and rear, have been so designed and so arranged as to increase their cooling power to the maximum for their size, with a minimum expenditure of energy to drive them, the forward fan now being gear-driven, while the rear one, embodied in the flywheel, serves to cool the engine base.

There are numerous other points of detailed refinement that are of interest as showing, for one thing, the extent of the study and the painstaking attention to detail that the designers have lavished on the car in the search for improvement. Thus a new intake manifold has been evolved; it is formed of brass tube, with the connections spun in, and so constructed as to be much lighter than that heretofore used, besides which it renders air-leaks impossible. Specially treated nickel-steel with a tensile strength of 120,000 pounds to the square inch has been adopted as the material for the crankshaft, while the connecting rods are also made of special carbon steel. The policy of subjecting every lot of material to thorough laboratory tests before acceptance has been adopted to a far greater extent than obtained previously, and special effort will be made in this direction from now on.

NEW FRANKLIN SELECTIVE GEAR SET.

Various changes have been made in the design of the carburetor of the Type D car, including improvements in the jet, float and shape of the mixing chamber, the last-named now being in the form of a Venturi tube, thus securing the maximum effect from the velocity of the air going by the jet. The latter is of the multiple type, and is shaped somewhat similar to the chandelier, allowing the air to mix more thoroughly with the gasoline spray as it leaves the nozzle. A regulation Longuemare type of float is employed, this being designed so that the float level may be readily changed by turning two screws in the float-valve stem, and is noted for its stability on rough roads. Warm air is transmitted to the carburetor by a new method consisting of a heat collector encircling the exhaust pipe, and which conveys the heat thus accumulated through a pipe running around beneath the engine base.

Not the least important change in the new Franklin is to be found in the ignition, and here the chief addition has been the adoption of a Bosch high-tension magneto as one side of a duplicate system of ignition. For the other side, the regulation high-

tension accumulator and coil outfit has been retained, the timer, however, being of special construction exclusive to these makers, and on which patents have recently been granted. It is of the roller contact type, but the contact blocks and rollers have been made from chrome nickel-steel and the pins from Tungsten drill rod, all of which are so shaped and hardened that little or no wear ensues from long service, and it has consequently been found possible to obviate any provision for adjustment.

The essential of lubrication is taken care of by a gear-driven oiler, instead of the belt drive formerly used and which is now bolted directly to the engine, thus making its operation much more positive and uniform than was possible with a belt drive. For the greater part, the lubrication system remains unchanged, but detailed improvements have been carried out as the result of past years' experience, so that the makers now feel confident that it represents as close an approach as possible to being trouble-proof.

Where the transmission is concerned, the same style of clutch as employed in the previous model has been retained, its operation proving so satisfactory that no change whatever has been made in it. It is of the multiple-disk type, phosphor bronze and steel disks alternating, these two materials being found to give a maximum coefficient of friction without any objectionable sticking qualities. Running in oil, as it does, such a clutch is not only very durable, but extremely easy in operation and free from trouble. The chief change to be found in the transmission is in the shape of an entirely new gear-set, which is of the selective type and is characterized by a simple and effective method of shifting that eliminates the familiar H sector for the lever. Whenever the lever is brought to a vertical position it is automatically set into the neutral position by means of a spring tension. To go into first or low, from this, it is only

VIEWS OF CONCENTRIC VALVES.

END AND SIDE VIEWS OF FRANKLIN CARBURETOR.

SECTIONAL VIEW EXHAUST S. DE OF FRANKLIN MOTOR.

necessary to slightly press outward on the lever and back. For reverse, the operation is similar, except that the lever is pushed forward to go into mesh instead of being pulled back. For intermediate, the lever is pressed inward slightly and pushed forward, and for the high-speed or direct drive, pulled back. The gear-lock and lever are integral, operating through a single pawl on the change gear-shaft by means of two teeth cut on one segment forming part of the trunnion. For each change, the spring tension is such as to bring the lever into neutral when shifting toward it, thus facilitating the operation of gear-changing. A new universal block joint has been added in the drive, which by reason of its design and construction is such as to minimize wear and prevent any lost motion, and a new dust-proof oiler is also a feature of the driving shaft.

The great amount of attention that has been devoted to the selection of materials for other parts of the car is also visible here, annular ball-bearings now being used throughout the gear-set, as well as on the rear wheels and in the differential, while ball bearings and a ball-bearing thrust are also employed on the gear-driven cooling fan. The motor is distinguished by the use of special die-cast alloy bearings made in accordance with a process of which the H. H. Franklin Manufacturing Company is the owner. The steering knuckles are mounted on adjustable ball-bearings inclosed in dust-proof cases. The connecting rods and joints of the steering gear, which are of hardened nickel-steel, have also been made adjustable. The entire differential has been constructed of hardened steel, making possible a reduction in its weight and increasing its wearing qualities. In its present form of construction, the compensating gear-plate has been eliminated, allowing free access of the oil contained in the dust-tight case to all the pinions. That no possible detail which would tend to increase the comfort of the user or the service rendered by the car has been overlooked is apparent in every feature. An instance of this is to be found in the provision of a new type of starting crank arrangement, which, in addition to obviating the risk from back-firing, also prevents the crank from striking the hood when the latter is raised.

The seamless steel tubular axles with spring-chair, brake-carriers and axle spindles brazed

on, which have been a Franklin feature for some time, have been retained intact, but instead of brazing, the differential housing is now driven on and riveted, thus making it possible to subject the entire axle to special heat-treatment without affecting the differential case. In the hub of each rear wheel is a small concentric reservoir backed by flanging washers, making the hubs dust and water-proof. An increased amount of braking surface has been provided, particularly in the case of the transmission brake, which has been made extra large in order to insure freedom from overheating. The Raymond contracting type of brakes is used, and are prevented from rattling by means of a spring device which holds them firmly in a suspended position when not in use. All the brakes are faced with a special non-metallic lining. In view of the increased power of the car, the tires are of a larger size than formerly, Type D now having 34 by 3 1-2 inch front and 34 by 4 inch rear, which are said to be the largest in current use for the

weight of the car, which provides freedom from tire trouble.

The frame is of the special Franklin construction that has always characterized this car, being made of oak sills and carried on 40-inch full-elliptic springs, front and rear. The front mud-guards have been stiffened to prevent undue vibration, and the running boards have been lowered 1 1-2 inches. In spite of the increase of 40 per cent. in the power of the motor, the total weight of the car has been kept down to the same limit as in the 1907 model by a careful selection of materials, which constitutes a further guarantee that the tire bills on the new car will still be kept down to the same low level as has always characterized the Franklin in this important respect. Taken all in all, the new car is a typical Franklin product—the result of long study and close application to the evolution of a system which has proved unusually successful, as is evident from the great number of these cars in daily use all over the country. It may well be termed the evolution of an idea, as the Franklin cars have all been built round the principle of air-cooling, of which the auxiliary exhaust is the mainstay.

PHANTOM VIEW OF MODEL D, FOUR-CYLINDER FRANKLIN MOTOR.

# Frontenac Cars for 1908

FRONTENAC 40-45-HORSEPOWER, THREE-PASSENGER SEMI-RACER, WITH FOLDING REAR SEAT.

WITH every possible facility for automobile work, as the result of many years' manufacturing in other lines and the consequent establishment of a large and well-equipped plant, it may appear strange at first sight that the builders of the Frontenac car, the Abendroth & Root Manufacturing Company, Newburgh, N. Y., did not enter the market on a large scale immediately upon coming to the decision to enter the ranks of automobile manufacturers. While this company already had the solid groundwork of experience, capital and equipment in other lines, it was lacking at first in that of experience where the automobile was concerned, and has, in consequence, made haste slowly, rather than stand sponsor for an immature product or one that should not represent the closest possible approach to mechanical perfection. With every facility at hand, the Frontenac has been developed slowly and under ideal conditions, which even extend to the roads on which the finished cars are tested out, as it has been truly said of the highways of the Hudson River valley that they are two kinds—up hill and down. Every device which has come to represent a component of the Frontenac has had to go through the process of being tested out on these roads before meeting with the approval necessary to incorporate it as a feature of the car, and the finished cars themselves all get their last and most thorough trying out over these same up-and-down highways before reaching the hands of the purchaser—a process that means future and lasting satisfaction to the latter, as well as to the builder of the car.

The Frontenac motor is of the standard four-cycle, four-cylinder vertical type, placed forward under a hood, and its dimensions are 4¾-inch bore by 5-inch stroke. It is rated at 40-45 horsepower, but shows an excess of 10 per cent. over these figures on brake tests, and this condition is made pre-emptory in the motors before they re-

ceive the seal of approval of the testing department. The cylinders are cast in pairs, with the water-jackets integral, and the pistons are cast with flat heads, and are provided with eccentric rings, slit at an angle of 45 degrees and placed in individual grooves above the piston pins. The latter are hollow of the rocking type, operating in large bronze bushings, thus

ensuring ample bearing surface and lubrication. The crankshaft is of the three-bearing type, and the journals and main bearings are all of liberal dimensions, while the bearing surfaces themselves are ground to an exact finish, this also being true of the cylinders, pistons and piston pins.

Both the exhaust and the inlet valves are placed on the righthand side of the motor, the plugs of the duplicate ignition system being placed over the different valves. These systems consist of a self-contained unit in the shape of a high-tension magneto on one side, and an accumulator and timing system, working through a single unit on the other. The magneto is located on the left side of the motor and driven by fiber gears, which also operate the oil-circulation pump, forcing the cooling water from the radiator through the jackets at a point immediately below the exhaust valves and leaving again at the top of the cylinders. To supplement the radiator a four-blade fan, running on ball-bearings, is provided. Lubrication is entirely by the splash system, fed by means of a gear-driven pump immersed in an oil-well.

The clutch is of the multiple-disc type, self-contained in the flywheel, and consists of alternate plates or rings of bronze and malleable iron, the latter of which are provided with cork inserts. The gear-set provides three speeds forward and the reverse, operating on the selective plan. Its components, as well as those of the rear axle unit, are shown in an unusual manner by the makers, as will be seen from the accompanying photographic illustration.

PLAN VIEW OF FRONTENAC CHASSIS.

REAR AXLE UNIT DISMOUNTED, SHOWING ITS COMPONENTS.

ch reveal both of these important parts dismounted. The use of chrome-nickel steel for the shafts and pinions of these parts, the employment of ball-bearings of the annular type, are features which show that the highest standards of engineering have been followed where these essentials are concerned. The gear-set is contained in an aluminum housing. The pinions have an especially heat-tested to enable the teeth to withstand shocks, making them practically proof against stripping, though in addition to this a special gear-locking device is provided, so that no trouble whatever has been encountered on this score. The drive is by propeller shaft, the wheels being attached to the axle by floating clutches.

The power plant and entire transmission system are supported on a subframe, which, like the main frame, is of heavy pressed chrome-nickel steel, amply braced, the whole being hot-riveted. The suspension consists of four semi-elliptic springs of liberal length and made of the same material, which, together with the shock-absorbers forming a part of the regular equipment of the car, make its riding unusually easy and comfortable. The braking system is concentrated in special drums on the driving wheels, running brakes, which are pedal operated, consisting of a set of contracting bands on the external faces of the drums, while emergency brakes, operated by the side lever, are of the internal expanding type and are located in the same drums. The front axle is an I-beam forging of carbon steel, the steering knuckles being mounted on ball-bearings, while particular attention has been paid to providing a type of steering gear that not only has as high a factor of safety as possible, so far as design is concerned, but which is also made of unusually liberal dimensions for the size of the car. The steering column passes through a cast aluminum dash at an angle that is varied, according to whether the model is a runabout or a touring car. The wheels are of the standard artillery pattern, and are equipped with 34x2-inch tires on the rear and 34x4-inch tires front, the wheel-

THE PARTS OF THE FRONTENAC GEAR-SET AND ITS HOUSING.

base being 124 inches and the tread 56 inches. The length of the chassis over all is 171 inches, with a clearance of 9 inches, while it tips the scales at 2,600 pounds. The models listed include a three-seated runabout, a standard touring car and a limousine.

### GERMANY'S TWO BIG SHOWS.

BERLIN, Aug. 14.—Berlin is preparing for a busy fall and winter, as the Imperial Automobile Club has decided to arrange a commercial van and omnibus competition for a period of six days. The competing vehicles will be divided into six classes, for each of which a proportionate daily task has been fixed. Besides this, preparations are on foot for two shows instead of the usual one this year. The limited space at the disposal of the exhibitors in the new hall near the Zoölogical Gardens, only opened last November and confined purely to show purposes, has rendered it necessary to divide the exhibition into (a) cars de luxe and (b) commercial and marine motors. The first is to take place from December 5 to 15 and the second from December 19 to 22. It will be noticed that the date fixed is a month later than ordinarily, when November was the chosen month.

After the West German tour has had to be indefinitely postponed owing to the ministerial permission being connected with alterations of too wide a kind to permit the tour being held on its proposed basis, it almost seems that the fourth German contest, which is even a much larger affair, will meet with the same fate. Wurttemberg and Baden have refused permission for the contestants to enter their countries, and if Prussia is made still more the scene of the affair than was originally intended, it is not at all impossible that the Prussian Government will put up new regulations and turn the competition into a perambulation. The promoters are considering the present state of affairs very earnestly.

According to Professor von Herkomer himself, who is at present staying in Berlin, it seems a little premature to talk with certainty of an English Herkomer event. Questioned on this point, the Professor stated that he could not say, but if he did he would most decidedly be in favor of stricter regulations concerning reckless driving, a thing he himself loathes and abhors, as all who love the car and its future do.

Of all the many proposals for the site of the intended German autodrome, those in the Eifel and the Taunus ranges have found the most favor with the committee, and on the return of the German Emperor the rough plans will be laid before him for his approval. A decision will certainly follow then very shortly. The Taunus is very much favored owing to its central and picturesque position and its standing as a motor track in the automobile world.

### AUTO 'BUS TO REPLACE TROLLEY LINE.

One of the most healthful sections of North Carolina embraces Pinehurst and Southern Pines. The country roads of the vicinity hardly deserve the name, being little more than wagon trails over the deep sand and making traveling exceedingly slow and laborious. A trolley line connected Pinehurst and Southern Pines, but there was not enough traffic to make the road a paying investment, and it has been discontinued. There is in process of construction an excellent clay road, the cost of which is being borne by the two towns. An auto 'bus, and one with a capacity of from twenty to twenty-five, is being sought by Southern Pines interests, the representative of which is Leon St. John, one of the managers of the Piney Woods Inn. When good roads become an actuality in this part of North Carolina it will be a favorite section for winter tourists who desire to take their cars South, but are unable to do so on account of the impassable highways. North Carolina will profit to a great degree by the building of good roads, and this fact is being realized by some of its wide-awake communities, as also the fact that nothing tends to bring about this much-needed improvement so quickly as the automobile.

### DOES THE PNEUMATIC TIRE INJURE ROADS?

Living as I do close to the main road from Chichester to Worthing, I had ample opportunity of watching the action of fast and large cars last year during Goodwood week, says a writer in *The Engineer*. The large, fast cars might be said to be followed by a rain of small stones or coarse sand, and by the evening of Cup Day—Thursday—the road was more like a sea beach than a main road. I frequently examined a piece of road after the passage of several large cars, and I invariably found that, whereas the road was compressed and the stones crushed down by a farm cart, with an automobile the stones were lifted, in some cases to a considerable depth. The action of a pneumatic tired wheel takes two forms: (a) The load on the wheel tends to bed, *i. e.*, to press down a stone more firmly. The maximum load cannot, however, be applied more than momentarily, owing to the shape of the wheel, and with fast-running cars, the pressure being applied for such a short time, the stone resists movement by its inertia. (b) Owing to the compression of the tire, the tire can act as a "sucker," and, therefore, clings to the stone before action (a) is at its maximum, and the stone, if small, is rolled out of its bed by its connection with a moving wheel, and either thrown off behind or left in place as a "loose" stone. Unless the stone is held in place by an active force, such as being keyed in with others, or being made practically *encastre* with cement, nothing will stand under fast-running pneumatic tired wheels but heavy blocks of stone. A floated surface to an under-bed of rough concrete will be liable to destruction by "rolling out," in the same way that two metal plates soldered together can be separated by rolling out, *i. e.*, by stretching one plate unequally to the other. Ultimate separation is certain in course of time. The time required depends on quality of workmanship and solder.

### FOREIGN TRADE OPPORTUNITIES.

Among the numerous inquiries received at the Bureau of Manufacturers for automobiles from American consuls in other lands, are the following two, which should merit the attention of makers who devote attention to the export trade. The first is from a consul in one of the Portuguese possessions, naming five persons in his district who are in a position to invest in machines. The demand is chiefly for low-powered cars, ranging from 6 to 12 horsepower, and to give satisfaction they must be of the strongest possible construction, owing to the nature of the roads.

The second is from a consul in Asia, doubtless Siberia, who desires American manufacturers to correspond with a prospective buyer whom he names, and who is in the market for eight 45-horsepower commercial cars fitted to carry about ten passengers in addition to some two tons of luggage. They must also be adapted to run in a country where the snow reaches 8 to 12 feet deep, and on frozen rivers, the temperature reaching 40° C. below zero. They are intended for travel partly through country having no roads and partly on the frozen river. They should be provided with snow shovels. The addresses and necessary data are on file at the Bureau of Manufactures, Washington, D. C., to which inquiries should be addressed.

A new type of induction coil has been invented which has for its advantages small dimensions and but a slight dispersion of the magnetic flux. The current from an accumulator is sent through a first coil, primary and secondary of which have an equal number of turns, and from the secondary of the first coil into the primary of the second coil with closed magnetic circuit, which transforms it to a high potential.

To keep steel tools in their handles, says *Machinery*, fill the handle with powdered rosin and a little rotten stone. Heat the tang of the tool hot, and then push it down hard into the handle. When it is cold it will be firmly set.

GRINDING A CRANKSHAFT IN THE LOZIER FACTORY.

### FACTORS IN THE COST OF A HIGH GRADE MOTOR.

Probably not one autoist in a thousand has the faintest conception of the seemingly endless processes that are necessary to the completion of a really high-grade motor—the hundred and one touches of refinement to which every one of its parts is subjected before it is passed as complete—operations that are not essential to its existence as a motor, but that are imperative if it is to deserve the foregoing appellation. It is something difficult for the average layman to understand how it is that two motors of similar dimensions can be turned out to look almost alike as two peas from the same pod, but that, nevertheless, are miles apart in price and in performance and lasting qualities.

To illustrate just where it does come in, the very genesis of the motor—the receipt of the material at the factory—may be taken as the starting point. To the layman cast iron is that and nothing else, but to the engineer there are as many grades of cast iron as there are of gold, and poor cast iron is about as good for motor cylinders as a gold brick is for conversion into coin of the realm. If it contain an excess of sulphur, phosphorus or other impurities, the result will be a casting that is brittle and worthless. Thus to insure satisfactory results the material must be given a preliminary testing, and this is true of all the material that enters into the construction of a high-grade motor, from beginning to end. It would be impossible to detail here the thousand and one precautions that must be taken in every step of the processes involved, if the result is to be in accordance with the plans of the engineer. The accompanying illustrations, which are from photographs taken at the plant of the Lozier Motor Company, serve to show two of the steps in the building of a high-grade motor that consume a great deal of the time of high-priced mechanics. One of these is the grinding of the crankshaft journals to a few thousandths of an inch in a machine especially built for that purpose, and the other shows the assembly of the various finished parts into the motor as a complete whole.

MOTOR ASSEMBLY ROOM OF LOZIER MOTOR COMPANY.

WHERE THE WINDING HIGHWAY CROSSES THE MORRIS CANAL AT TOWACO.

EVANS is an automobilist. This in itself is not a very serious accusation. The trouble is, however, that he is a Jerseyite—lives in New Jersey, the land of the mosquito—the State where they won't let you use non-skids—the State where the automobile laws are shocking beyond words—the stronghold of the Oil Trust that rockets the price of gasoline—and there are other things, too. When Evans moved over there from little old New York with his automobile and the rest of his possessions, including his family, his sorrowing friends and relatives bade him farewell sadly, and, after he had gone, fought off the depression following upon his departure.

When Brown one day found an envelope in his mail, addressed in Evans's imitation-of-a-road-map hand, he hesitated about opening it. "Perhaps it'll upset me for the day's business," he thought. But finally he read the letter.

First he looked relieved, then puzzled, and then incredulous; for Evans actually said he liked New Jersey—*liked* it! "If you don't believe it, come over and spend a couple of days with us and I'll hike you round some of the beauty-spots in my old car," wrote Evans. Brown hesitated, but at last asked Evans to set a date. Evans wrote: "Meet you at the 7.50 in Elizabeth with the car Sunday morning. Bring along Mrs. Brown and the two Browns." The message was brief and at once to the point.

HUNGER OVERTOOK AND CAPTURED US NEAR DENVILLE.

So it happened that Brown and Mrs. Brown and the two Brown boys met Evans and his wife and six-year-old boy on the platform of the Elizabeth station on Sunday morning, bright and early. Evans bundled all the Browns into the tonneau and got them settled. The engine snorted, the horn honked, the car started, headed east, and the voyage of discovery had commenced.

Every one was so busy talking and trying to listen at the same time that it wasn't until Westfield was reached, six or seven miles from Elizabeth, that the party, as a whole, awoke to the fact that it was being propelled through New Jersey scenery at the rate of—well, whatever the legal rate is. At Westfield a sharp

turn to the right was made into Westfield avenue, and at Springfield, five miles from Westfield, another sharp turn to the left was made into the Morristown Pike. A smooth, rolling road, with lovely bits of hill and valley scenery on either side, led along for four miles to Chatham and two miles more to Madison.

The next five miles—two to the Morris County Golf Club and three to Morristown—led through scenes extremely upsetting to the man who would like to own a country residence, but can't afford it. The road is simply a smooth driveway between the most delightful country homes—Italian villas, English residences, Colonial houses, modern castles—estate after estate, garden after garden, sweep after sweep of smooth, velvety lawn, till one feels as if he were trespassing on a millionaires' colony. Piously inclined millionaires were starting for church; at the great front doors stood carriages and automobiles, and into them, with Sunday decorum, were climbing beribboned and beruffled ladies and frock-coated and top-hatted men—all looking intensely churchy. Even the chauffeurs looked solemn and law-abiding; they wore no goggles and their collars were clean. At the links of the Morris County Golf Club—a beautiful estate and a delight to the heart of the golfer—a lot of flanneled enthusiasts were quietly swishing little white balls into flag-marked holes in the ground—when they didn't miss them—but they seemed only to add to the Sunday quiet of the atmosphere.

Finally the panorama of palaces ceased and Evans ran his car into Morristown. Really, the Morristown automobilists ought to wake up and erect a few sign-posts for the guidance of brother automobilists. You go into the town by the main road, which leads along the left side of the big public square, and if you are a normal human being you'll go right ahead, past the square. Now, if you're bound for Lake Hopatcong, or some of those beautiful Jersey spots, where nearly everyone goes who automobiles in that direction, you must turn to the right, following the square, and take the road that leads off from the opposite side of the square, running in the same direction as the road that took you to the square in the first place.

Out of Morristown the road winds and bends in and out among the trees and the country is quietly beautiful. Four miles of this brought the car to a picturesque bit, to the left of the road. In the foreground, just over the wire fence, is a round pond, with a tiny island in the middle; beyond and beside the pond, a series of barns and stables, clean and white; nearer

the road, a low, bungalow-like house, with wide verandas and awnings; and, as a background for the whole, the tree-clad hills, whose dark green made an effective setting for the dazzling white of the buildings.

"Gee!" ejaculated Brown, "whose joint is that?"

"That?" replied Evans, "that's where Homer Davenport lives—the cartoonist."

"You don't say! Let's photograph it."

"Ladies on the veranda. Maybe they wouldn't like it. I'll take the photograph if you'll go and find out if they'll let us."

Brown walked to the most obvious gate, and was confronted by a sign: "Please Use the Other Gate." Wondering if the people on the veranda were snickering at him, he trudged back to another gate and entered. Now, Mr. Davenport probably knows why that sign was put up, but poor Brown doesn't. He got into a maze of wire netting fences and fowl-yards and little gates and hen-houses till he perspired in his efforts to get out. Finally he saw an opening, dashed out and made his way across the smoothly-cut lawn to the veranda. His meek request was courteously met with the information that doubtless Mr. Davenport wouldn't object.

"There he is now, coming around the pond."

A big, sunburned man with an old straw hat on his head, in his shirt-sleeves, looking for all the world like a contented farmer taking a stroll around his place. Was that Davenport? Must be; no one else around.

"Sure. Go right ahead. Photograph all you like."

Brown said "thank you," and made for the car. But this time he did *not* "use the other gate."

Four miles further on, after passing Mount Tabor, a stop was made for lunch, just beyond Denville. At Denville there is a hotel that looks as if it might be one of the many places where "Washington spent a night," but it isn't. But it's a place where uncounted automobilists have stopped and eaten and drank, and outside is an old iron pump where many and many an automobilist has stopped and filled up his water tank—that is, the tank of the car. The autoist's personal tank is usually filled inside.

A sharp turn to the right past the faithful old pump, and the car was speeding down the Rockaway road toward Parsippany—a typical country store with a few houses near it—and the great reservoir whence Jersey City derives its water supply. At Parsippany Evans turned off to the left, onto a road skirting the reservoir and crossing an iron bridge. It was on this road that the first, last, and only mechanical trouble of the day arose. The engine, a two-cylinder vertical, began to hiss fiercely at every stroke.

"Oh, Lord!" groaned Evans, "there goes an inlet valve."

In two minutes the cap was off the valve chamber of the forward cylinder; the valve stem was down and out of sight. On

IN FRONT OF ARTIST DAVENPORT'S FARM NEAR MORRISTOWN.

top of the cage was the spring, in two pieces. Evans picked them out tenderly, cussed each one separately when it was safely out, and reached for the pin that should have been there. Nothing doing. Out came the cage and then the valve. "Thank goodness, it's all right," said Evans. But the pin? Maybe it was on top of the piston, waiting a chance to chew grooves in the cylinder walls. Horrible possibility! But Evans, with delicate touch, fished around in the valve passage with a pair of pliers, and triumphantly dragged forth the tiny steel pin.

"Hooray!" said he, fervently.

Evans fished out of the box a new valve spring, put there for just such an occasion, and in fifteen minutes from the first hiss the engine was chugging away as merrily as ever.

Four miles from Parsippany, a half-dozen houses and a hotel are called Oklahoma. A few miles further on the old Morris canal was crossed on one of the many very disconcerting bridges that carry the roads over this quaint old waterway. The road, running almost parallel with the canal, takes a sudden turn, almost at right angles, and at the same time shoots up—Evans said it was nearly perpendicular, but he exaggerates sometimes—and onto the hump-backed bridge. The process is reversed on the other side, the road pitching suddenly down and turning back in

MOUNTAIN VIEW DOESN'T MEAN THAT MOUNTAINS ARE VISIBLE, BUT THE WOODED CANAL BANKS PLEASE THE EYE.

THE PUMP AT THE CROSS ROADS AT DENVILLE.

the original direction. These canal bridges are really dangerous places if the car is not very carefully driven.

At a spot in the middle of the fields called Towaco a stop was made to photograph one of these bridges—the mildest specimen encountered—and to inspect and photograph one of the inclined planes that are used in lieu of locks on the Morris canal. The canal is brought to a place where the rising country would, ordinarily, require the construction of locks and the continuance of the waterway on a higher level. Here they simply stopped digging, walked up the hill a few hundred yards and started another canal on the higher level. The ground between the two sections of canal was smoothly graded, a very broad, heavy steel track laid, reaching to the bottom of the canal both above and below, and a ponderous truck placed on the rails. When a barge comes up it is floated over the truck, which is run down under water; the barge is made fast to the carriage, and is hauled high and dry overland, and at the top the truck dips down again into the high level canal till the barge floats, and that's all there is to it. The power for hauling is supplied at this particular plane—Plane No. 10, East—by water taken from the high level canal and led, through a wooden flume, to a water wheel in a power house; the huge endless steel cable is hauled by a drum slowly turned by the wheel.

At Mountain View—so-called because there is no mountain in sight and nothing in particular to view—the Pompton road was taken with a turn to the right, and just as the odometer indicated three miles from Mountain View the car rolled out on the bridge over the Hackensack river at Little Falls.

It is really a beautiful spot. The river runs through a deep rocky gorge, spanned by the highway bridge perhaps fifty or sixty feet above the water. Above, a dam has rather increased than lessened the natural beauty of the rapids—or falls, as they seem

WHERE THE HACKENSACK FLOWS BELOW LITTLE FALLS.

to be called—and a huge factory building on the bank looks as if it grew out of the rocks. Below the bridge the sides of the gorge are quite wild, innocent of buildings. A massive stone bridge crosses the river a few hundred yards below the highway bridge and carries the canal over the gorge.

The Pompton Pike took the car into beautiful Montclair. From the heights of Upper Montclair it is possible, on a clear day, to see New York, some 25 miles distant.

At Bloomfield the party was hailed by a hospitable friend of Evans, and everybody was treated to welcome refreshments on a cool veranda.

Elizabeth. Everyone began comparing notes. "Well, how about New Jersey?" asked Evans, as the car drew up at the station platform, twenty minutes before train time. And it was agreed that nothing in the shape of a poor road has been seen, except in some of the village streets; that no one had seen even a single stray mosquito; that the country was picturesque and devoid of monotony. In fact, Brown's sorrow for Evans vanished completely, and he even caught himself regretting that he must return to his little flat in a wilderness of brick walls and glaring pavements. Then the train came in.

"Good-bye, old man," said Evans. "Suppose there won't be any use asking you to come over and take another trip, will there?"

"Just try it. And as soon as you like," said Brown, jumping for the last car.

#### SOME IGNITION DON'TS FOR THE NOVICE.

Ignition is a subject of interest, especially to the amateur driver, and these don'ts from J. D. Maxwell, vice-president of the Maxwell-Briscoe Motor Company, are well worth keeping in mind:

Don't forget to test the batteries and note that they are strong; don't guess.

Don't screw down battery connections with your fingers, use pliers.

Don't let the various electrical connections become corroded, but keep them clean. You cannot get a good connection with dirty terminals.

Don't run an accumulator or storage battery till exhausted.

Don't make electrical connections by using simply a stripped wire, always use a regular battery terminal, and see that the wire is securely fastened to the terminal. It pays to keep your ignition system up.

Don't allow your electrical wires to become oil soaked.

Don't use a coarse file to true the vibrators, platinum is expensive. Use only a dead smooth file, and use that sparingly.

#### AIRSHIP "PATRIE" VISITS PRESIDENT.

PARIS, Aug. 15.—A striking example of the utility of steerable balloons was given last week when the French military airship *Patrie* sailed from Meudon to Rambouillet, thirty miles away, on a visit to the president of the Republic. President Fallières was waiting in the grounds of the chateau to receive the four officers on board the airship. After an hour's interview, during which the *Patrie* was anchored above the grounds, the officers mounted on board, the motor was cranked and the return journey made at a speed of 37 miles an hour. The *Patrie* will shortly make the long journey to its military station on the eastern frontier, traveling the entire distance under its own power. It is intended to ask for funds to build three more airships of the *Patrie* type this fall, and there is little doubt but that the necessary appropriation will be forthcoming without much delay.

## CLUBS PREPARE FOR SEPTEMBER DOINGS

### JOINT MEETING OF ALL BAY STATE CLUBS.

BOSTON, MASS., Aug. 19.—It has been voted by the directors of the Massachusetts Automobile Association that it is advisable for the members of all constituent clubs to get together and decide what can be done for the benefit of the fraternity as a whole, as well as for the interests of sport, and it has therefore been decided to hold a joint meeting which will take place from Friday to Monday, September 6-9, at the Hotel Wentworth, Newcastle, N. H. The meeting is to be held on the ground of the famous peace conference between Russia and Japan, and it is expected to have a representative showing of the Massachusetts State Automobile Association. A committee, appointed by the directors, has planned a run, the arriving time being Friday night, when suitable entertainment will be provided. This is to be followed on Saturday by a baseball game between members of the different clubs, and on Sunday there will be a short run and a clam bake, while on Monday the management of the hotel will give a gymkhana for owners only. On Saturday night there is to be a banquet at which some prominent down east autoists will speak. Particular attention is to be paid during the course of the meeting to legislation, which is necessary for the safety of the autoist and the pedestrian, and the so-called Light Bill will come in for an extended discussion. It is expected that the Bay State Automobile Association will send a large delegation, while the majority of the other clubs from all parts of the State will be suitably represented. Frank C. Hall, manager of the Hotel Wentworth, and who is a member of the Bay State Automobile Association, will make special preparations for the reception of the visitors.

### PITTSBURG CLUB RACES SEPTEMBER 9 AND 10.

PITTSBURG, PA., Aug. 19.—The Automobile Club of Pittsburg has fixed upon September 9 and 10 as the dates of the annual races to be held here. Owing to the fact that the Tri-City Fair is held at the track during the preceding week, the meet is to be held at the Brunot's Island track and there will be five races each day, Oldfield having been secured to make a new attempt on his previous record of 52 seconds for the mile. D. P. Collins, 452 Seventh avenue, has charge of the entries, and the program as thus far arranged is as follows: The first day is to be opened with a fifty-mile race for fully equipped touring cars for a \$100 cup, and is to be followed by a five-mile event for all cars up to 20 horsepower, the prize being a \$50 cup. Then comes a twenty-mile race for four-cylinder gasoline cars, followed by a ten-mile special match race for special racing cars, and winding up with a fifteen-mile handicap for four-cylinder cars, all to be 1908 models. The second day is also opened with a fifty-mile event for stock touring cars, followed by a fifteen-mile handicap for stock runabouts costing up to \$5,000, the prizes being \$100 and \$50 cups in the two events. The third race is a twenty-mile event for four-cylinder cars and is followed by a special match race for stripped racing cars at ten miles, the prizes in both this and the fifth race, which is a twenty-mile event for six-cylinder cars only, being \$100 cups. The rules permit the removal of mufflers where cars are not provided with cut-outs.

### ALAMEDA COUNTY AUTO CLUB BANQUET.

OAKLAND, CAL., Aug. 16.—One hundred members of the Alameda County Automobile Association were the guests of the Criterion Café at Fruitvale, a few nights ago, and had the best chance to forget, even tire troubles, that they have enjoyed in a long time. Twenty odd machines left the corner of Broadway and Twelfth street at midnight, all well loaded with passengers, and an hour later they sat down to an elaborate spread provided for their benefit. President R. S. Cole of the association officiated.

### MOTOR BOATERS AND AUTOISTS TO COMBINE.

INDIANAPOLIS, IND., Aug. 18.—Due to the fact that they have many interests in common and could achieve their ends much more satisfactorily as one body, the Indiana Automobile Club and the Indiana Motor Boat Club, both having headquarters in Indianapolis, have combined, the plan having been favorably acted upon by a committee of the two organizations. The Automobile Club of Indiana, which is allied with the American Automobile Association, and gives its members all the privileges of that body, is booming its membership and expects to reach the 2,000 mark by the end of the year. The combination with the boat club makes an addition of 100 members in one block, and better enables the combined body to carry out a plan long pending with both of them—that is, the erection of a large and commodious clubhouse. The Motor Boat Club is at present erecting a clubhouse on the river at Broad Ripple, which will shortly be completed. The headquarters of the automobile club are at present in the Denison Hotel.

In addition to its good roads campaign and other works for the benefit of autoists generally, the club is at present actively getting after Indianapolis' young vandals who dellight in tinkering with machines, scattering glass along the roadway and the like, and have already secured a number of convictions.

### QUAKER CITY MEET FOR POINT BREEZE TRACK.

PHILADELPHIA, Aug. 19.—The Contest Committee of the Quaker City Motor Club has changed the date of its meet, scheduled for August 31, to Saturday, September 7. The committee also decided that Belmont track, although it possesses a superior surface to Point Breeze, is too far from the city and too hard to reach, and the latter track will be utilized. The 100-mile race, which will be the star event of the programme, will be for the championship of Pennsylvania, and already quite a number of entries have been received from the owners and representatives of fast cars. Many of the high scorers in recent 24-hour events will also be here for the event. Two 25-mile races will be the curtain raisers. The first will be for stock runabout, and was put on in response to several requests from owners of certain "low, rakish, piratical" craft in that class, each of whom believes that his car can sprinkle its dust on all the others. The second 25-miler will be for stock touring cars, "all on." Both these events have already filled well.

Chairman Johnson, of the Quakers' Contest Committee, is endeavoring to get together a crowd to attend the fall meeting of the Pennsylvania Motor Federation, at Bedford Springs, sometime in September. The officers of the Philadelphia and Germantown clubs are also working to the same end. No specific date has been set for the Federation meeting, but it is proposed to have it on some Sunday in September, allowing Saturday for the run from the various cities to Bedford and Monday for the return.

### PORTLAND AUTOISTS TAKE A MOUNTAIN RUN.

PORTLAND, ORE., Aug. 16.—Members of the Portland Automobile Club held an enjoyable outing this week in the shape of a mountain run. The latter was to a place known as Welche's Resort, in the heart of the Cascade Mountains and about fifty miles from Portland. It is on the road to Mount Hood and, for the most part, the roads are good, though many of the grades are very steep. The trip can be made in a car in about five hours, so a number started earlier in the day in order to have an opportunity to cast some of the mountain streams for trout, the main body leaving in the afternoon. The trip was planned for a week previous, but was found to conflict with the endurance run and was accordingly postponed.

Value of a Uniform Basis of Rating for Contests.

Interest soon wanes in anything that is not well understood, and the public wants to be amused rather than instructed. Hence, the extremely limited amount of popular favor that has been extended to events conducted on a scientific basis, in which every possible factor has been taken into consideration. It is quite evident that a race in which, after an exciting finish, the apparent winner is robbed of its honors and the latter are awarded to a car that came in a poor third, can hold but a small amount of interest for the spectator. He wants to see a car win with his own eyes, and, knowing little of abstruse mathematics and caring less, such awards savor more of injustice to the winner than a mathematically exact consideration of all the factors concerned. In brief, the man in the street wants to see actual victories, rather than a performance which means nothing until logarithms have been called into play to decide the result.

For this reason the suggestion of the Importers' Automobile Salon that a joint committee from such representative organizations as the Association of Licensed Automobile Manufacturers, the American Motor Car Manufacturers' Association and the Automobile Club of America, be appointed to consider uniform methods of rating cars in all tours, runs and contests, is one that should meet with favor from all concerned. In the interim, it is recommended that simple horsepower basis be employed, and this also is a suggestion of great value. The sooner such a uniform code of regulations as that proposed is adopted the better it will be for the industry at large.

But the actual conduct of these contests and the enforcement of the rules governing them, in our opinion, should be left to disinterested bodies. Therefore, after the conditions have been agreed upon by the various manufacturers—at least by a majority of them—the contests should be managed by the clubs of the American Automobile Association and by the national organization itself, when it comes to the holding of the Vanderbilt cup race or the one big tour of the year. With New York City as its field of operations, the Automobile Club of America will have an advantage over the other clubs of the country in making its events stand out prominently.

**In the Founding of a Great Industry, Grown Suddenly.** To the general public, whether automobile wise or not, it doubtless appears as if the American industry were passing through a crisis. It must be admitted that, to the uninformed, a succession of financial troubles, in the face of the prevailing prosperity, certainly does not seem to augur well for the future permanency of the industry, nor for its present economic solidity.

To a certain degree, the automobile industry is an entirely anomalous growth of the past half decade. In that short period it has assumed proportions entitling it to rank with others of many years' standing, and it is not strange that its career thus far has been marked by conditions impossible in other fields. Though the comparison may not be altogether just, in a certain sense the business of making and selling automobiles has grown like a mining settlement, springing into being over night, advancing by leaps and bounds, and at the end of a few years presenting all the outward appearances of an old and well-settled community, but actually crude and in the first stages of development. This appears to be the present situation of the automobile industry, which, having passed through the constructive period, is now entering upon a second stage in its growth, that is destined to leave it firmly established.

So far as the failures themselves are concerned, it is not difficult to discern their moving cause, nor need their number or close succession give rise to any apprehension whatever, even though two of them are of unusual prominence, as well as being members of an association whose boast has long been that it represented the backbone of the industry—but one of its members ever having gone under, and it was a failure before it was admitted. Investors have been attracted by promises of huge dividends, and, disappointed by the reality, have stranded their concerns by withdrawing support; inexperienced concerns have entered the field, while mismanagement and unsound engineering have contributed their quota to a list that is not over large.

**Racing on Highway Without Proper Protection.**

To those who think that the wishes of William K. Vanderbilt, Jr., should be utterly disregarded and a race for his cup held on American roads, without the protection of a militia guard, attention is called to the fate of the Criterium of France, conducted by the Automobile Club of France. Because of a large number of fatalities, resulting from the absence of military, the Government terminated the affair on its second day. Combined with the Criterium of France was the Coupe de la Presse, the latter event subsequently being successfully held over a guarded course with no accidents of any kind.

Mr. Vanderbilt is to be commended for insisting that his cup shall not be raced for except with military protecting the on-lookers from their own dangerous curiosity. Furthermore, it is a certainty that the Automobile Club of America has no desire to take away from the American Automobile Association the honor and profits from this big race, as long as its holding must be over unprotected highways.

The efforts of those who, for selfish reasons, have endeavored to make it appear that the cup donor and those associated with him have not been sincere in trying to conduct a 1907 race will find that their dishonest criticism will only react upon themselves.

### SOME MORE VANDERBILT CUP COURSES.
